THE work of constructing the Linlithgow new sewage scheme, which was commenced about twenty months ago, now practically finished. But for a considerable portion of the sewer in the Lady's Park, skirting the loch at the west end of the burgh, having been damaged through a subsidence in February last, the scheme would have been completed early in the spring. Last week the works were inspected by the members of the Town Council, the engineers and the contractors. The scheme consists of sewers throughout the burgh and sewage-disposal works on the "septic" tank method, with contact-beds or filters. The disposal works are situated on about 4 acres of ground along the west side of the Mains Burn, which has its outlet in the river Avon, about 400 yards below the works. The tank is divided in two divisions, so that if necessary the one can be thrown out of operation for cleaning or repair while the other is keeping the contact-beds supplied. There are two large contact-beds over which the effluent is passed by distributors for the purpose of aeration. A part of the ground for the works consists of open porous sand and gravel, and this has been converted into land filters, which take the effluent from the contact-beds, and so complete the final stage of purification of the sewage before the effluent passes into the stream adjoining the works. It is expected that the entire scheme will cost about 14,000*l*. The engineers are Messrs. Warren & Stuart, Glasgow.

ELECTRIC NOTES.

THE accounts of the lighting committee of the Brighton Town Council for the year ended March 31 show that the year's working of the electric-light undertaking has resulted in a net profit of 7,984%, upwards of 3,000% of which will be applied to the relief of rates.

CONSIDERABLE progress is now being made with the electric-power station at Chelsea, where the electricity is to be generated which is to provide when ready the motive power of the rejuvenated District Railway. The main building is to be 453 feet long and 175 feet wide, and the somewhat unusual course is being adopted of placing the boilers on two floors one above the other, so that ground area is economised. The height of the building is thus being made 140 feet. Strength is insured by the adoption of the American steel-frame building system of construction, with brick and terra-cotta screens all round, and with a roof and floors of concrete. The amount of steel in the buildings alone is 5,800 tons. The arrangement is that the coal will be received by lighters in a creek alongside the works or by rail, and will be discharged by 1-ton grab cranes on to conveyers and elevators to the stores at the top of the building. From here it is to be distributed by the same means to each of the 80 Babcock & Wilcox boilers to be installed. These are to be operated by chain mechanical stokers, and are being fitted with superheaters. The boilers are to be in groups of eight, so that each group

will supply steam under normal conditions to one of the steam turbine generator sets. Each of these turbines will rotate at 1,000 revolutions per minute three-phase generators of 5,500 kilowatt capacity, but capable of being overloaded to the extent of 50 per cent. without any danger and for a period of two hours. The voltage is to be 11,000. Thus the capacity of the station will be 55,000 kilowatts, with a possibility of touching 80,000 kilowatts. The daily consumption of coal is expected to be 800 tons, and storage capacity is provided for 15,000 tons. The switchboard is to be on three gallery floors, and in connection with it there will be 23 sub-stations. A line of 64 ducts is being constructed to carry the feeders to the nearest point on the District Railway at Earl's Court.

BUILDING AND BUILDERS.

A CHURCH HALL is being erected at Haswell, and the foundation-stone was laid on the 8th inst. The building adjoins the east end of Haswell Church, and will cost 8000l., exclusive of the site.

THE foundation-stone has been laid of a new town hall, municipal offices, public library, recreation-rooms and estate offices at Stornoway. The whole will be included in an imposing building, which it is estimated will cost 10,000l. to erect.

THE health committee of the Liverpool Corporation have passed a resolution approving of an arrangement with the London and North-Western Railway Company with regard to the provision of a new outfall sewer in continuation of Dale Street, Garston, under land upon which the company propose to construct works, and instructing the city engineer to cause a sewer to be constructed at a cost not exceeding 6,545l.

WORK has been started in connection with the rebuilding of Bow Bridge. The enterprise is being carried out as a joint improvement by the London and the Essex County Councils, and, in view of the forthcoming electrification of the East London tramways, will be pushed on with all speed. The new bridge will be some 8 feet wider than the existing one, will have easier gradients, and will cost nearly 10,000l.

THE institute known as the Brixton Polytechnic has just been taken over by the London County Council with the object of transforming it into a building trades instruction centre. It is expected that the Brixton Technical Institute, which it will

ALSO AT LIVERPOOL, MANCHESTER, PARIS, AND CAPE TOWN

henceforth be known as, will be opened early in November. Instruction in practical building work and in general building trade subjects is to be the chief item in the curriculum of the new institute. A principal has already been appointed, and arrangements are rapidly being pushed forward for the reception of the students.

COOKHAM REGATTA, which took place on the 13th inst., was marred by the sudden death, just before the close, of Mr. George Lacey, a well-known local builder, who had been engaged in booming the course for the ladies punting. He was in the act of returning to the raft in a punt when he fell forward on his knees. Dr. Weaver pronounced life to be extinct.

SUCH few remains as survive of Fotheringhay Castle are being zealously guarded by the Peterborough Archaeological Society, a necessary work, as it has been found that, coincident with the increasing number of visitors attracted to the historic spot of late years, the mounds have been gradually disappearing. A design has been selected for an enclosing railing, resting on a plinth of granite, with the Scottish thistle and crown dominant. It will be sufficiently open not to obstruct the view. The site on which the castle stood belongs to Lady Wantage, who has most readily acquiesced in this form of preservation.

THE work of removing the debris on the west side of the National Gallery, Trafalgar Square, has been effected, and a source of danger to the national institution from fire removed. A space or court about 25 feet wide divides the adjacent houses, some of the walls of which have been strengthened and stuccoed, whilst the masonry holding the railings enclosing the turf laid soil and tropical plants has been extended many feet towards Pall Mall East. To completely isolate the famous gallery it will be necessary to remove a small block of premises in the north-west corner.

TRADE NOTES.

A LARGE clock has just been erected on the public hall, Bourton-on-the-Water, Gloucs, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It has been made to the designs of Lord Grimthorpe, and has all the latest improvements.

MR. JOHN TANN, of "Anchor" safe fame, is justly proud of the following letter from Messrs. Dardagan Bros., of Salisbury Umfali, Gwelo, Selukwe, Camperdown, and Yankee Doodl mines, Rhodesia, B.S.A., bearing testimony to the fire-resisting quality of a safe of his manufacture:—Dear Sir,—You will be interested to know that our store premises in this township were totally gutted by fire on May 25 last, and that our books and papers were in one of your "Anchor" reliance safes and although the safe was buried in a seething mass of fire, the books, cheque forms and papers came out practically untouched. The first stamp [stamps were attached] is an ordinary one issued here, the second was taken out of the safe after the fire, and you will see that except for being slightly oxidised from the intense heat, it is none the worse for its baking. Owing to our having our books intact in your safe, our claim was passed after an examination of the accounts by the insurance company without demur.—Yours faithfully, per pro Dardagan Bros., Thos. J. Sowter, General Manager.

MESSRS. MANLOVE, ALLIOTT & CO., LTD., Nottingham have just completed an important contract for the erection of combined refuse destructor and power plant for the Corporation of Nottingham, at which the steam-power raised from the burning of refuse is utilised for generating electricity for propelling part of the tramcars running in the city. A similar plant is in course of erection by the same firm, also for the Nottingham Corporation, which will then have three installations put up by Manlove's; while they are erecting destructor installations for the Corporations of Birmingham, Eastbourne, Wolverhampton and Liverpool. At this last-named city between 15,000 and 20,000 Board of Trade units will be generated per day (when the new installation is in full work) from steam raised from refuse burned in destructors built by Manlove, Alliott & Co., Ltd. Cambridge is another example of what can be done with refuse in properly designed destructors and power plants. Here the steam is employed to drive the pumping-engines, which are frequently called upon to raise over 3,500,000 gallons of sewage per day to a height of 50 feet, and deliver it to the sewage farm which is over two miles away. Brentford destructor is on the same lines as the Cambridge plant, and gives equally good results at the sewage pumping-station. The same remark applies to the destructors and power plants at Southampton and Stafford. This firm has brought out a new destructor for small towns, the first of which is erected at Loughborough, and is capable of burning over 100 tons of refuse per day.

ton of refuse per hour, so its capacity is according to the number of hours it works, thus:—10 tons per day, 10 hours' work; 20 tons, two shifts 10 hours each. We understand that orders for several of these plants, for Grantham, Newmarket, &c., have been placed recently. A large sewage pressing-plant has just been successfully completed for the Bradford Corporation, and unique results are being obtained. From their engineer at Shanghai the firm have received satisfactory reports of work being performed by the pair of compound Corliss pumping-engines, developing 225 horse-power, and supplying 6,000,000 gallons per 24 hours of drinking-water to the inhabitants of Shanghai. In the laundry machinery department, they have in course of manufacture a very large plant for the Admiralty.

VARIETIES.

To meet the growth of Welsh Congregationalism in West Denbighshire a new church has been erected at Llangollen, and opened for public worship. The church cost 3,100*l.*, and will accommodate over 550 persons.

At a meeting of Dundee engineers it was decided not to submit to the proposed reduction of 1*s.* per week on their wages. The feeling of the meeting was that the present state of trade did not warrant any decrease, and the decision of the men to resist a reduction was unanimous.

THE first portion ready for occupation of the new naval barracks at Portsmouth was taken over by the Admiralty on Monday. Within a short time the whole of the buildings will be occupied. The barracks are the largest in the world, and the officers' quarters make a fine pile of buildings. One peculiarity of the barrack accommodation is that the men living in them will not sleep in beds but in hammocks slung from the ceiling, as aboard ship.

A SPECIAL meeting of the Hamilton Town Council, called in terms of a requisition and motion, was held on Tuesday, Provost Keith presiding, to consider the proposal to proceed with the erection of a town hall and municipal buildings at an early date. A month ago the matter was before the Council, when the proposal, not receiving the requisite two-thirds majority, was dropped. At Tuesday's meeting Treasurer Kemp, seconded by Bailie MacHale, moved in terms of the motion. The previous question was moved by Councillor Cassells, and seconded by Councillor Brown. After some

discussion, the motion to proceed was carried by ten votes to two. Three members being absent, it was afterwards agreed to meet a month hence, in terms of statute, to confirm the resolution.

THE tower of St. Margaret's parish church, Arbroath, has just been completed. The plans were prepared by Mr. T. S. Robertson, architect, Dundee, who designed the church, which was finished in 1879. In the completion of the tower the early English style, which is characteristic of the edifice, will be carried out. The tower, as it has stood for nearly twenty-five years, has a height of 48 feet. The addition measures 48 feet, so that the height of the completed spire will be 96 feet from the ground. Messrs. Ramsay & Gordon, builders, Arbroath, have secured the contract.

PROFESSOR HALSEY C. IVES, chief of the art department of the International Exhibition to be held in St. Louis next year, has appointed Messrs. Edwin A. Abbey, J. McLure Hamilton and John S. Sargent, with Mr. Joseph Pennell as hon. secretary, to act as a committee of selection for the United Kingdom, and as a jury to decide upon the works submitted to them by American artists living and working in this country. By the death of Mr. Whistler (chairman) the committee is deprived of a member whose advice and assistance had been most useful in the earlier stages of their work. A regulation has been adopted by the art authorities of the exhibition to the effect that "American artists residing in a foreign country will be admitted only as exhibitors in the United States section." Further information will be supplied upon application to the hon. secretary at 14 Buckingham Street, Strand.

NEW CATALOGUE.

MR. C. D. PHILLIPS, of Newport, Mon, is issuing an illustrated descriptive catalogue of his well-known patent lock-jaw roofing tiles, &c. The object which Mr. Phillips claims that he has attained by this invention is the production of a roofing tile that shall form a perfectly weather-resisting roof, and be impervious to wind, rain or snow, at the same time combining all the points necessary for an economical, ornamental and efficient roof. In order to attain this object, on each of the four sides of the tile a system of grooves with corresponding tenons is formed, so that each tile locks into others on each side, top and bottom, the bottom of top tile butting against or locking into its corresponding lower one. The tiles in process of manufacture undergo a very great pressure, which effectually

closes the pores of the clay, making it dense in texture, practically non-porous and everlasting in wear, and of great strength; it also has the effect of giving the tile a beautiful smooth surface, and in fact perfecting its construction in all parts. Half-tiles of each pattern are made similar in every respect, and lock in the same manner, so that in every alternate course a half-tile is used, which forms what is called a "break-joint" throughout the roof. At the present time only two patterns are being made, viz. the "single" grip and "double" grip, the latter having a double grip, with two grooves and tenon joints instead of a single one. The single grip, it is said, makes the lightest roof of any tile in the market, for the area covered, its weight being about 600 lbs. per square of roofing, at a cost of 15s. 9d. per square at the works; the double grip is somewhat heavier, but is rapidly growing in favour on account of its further security, and being rather more architectural and massive in appearance, it is usually preferred for roofing mansions, public buildings and other prominent structures; its weight is about 800 lbs. per square, at a cost of 19s. per square at the works. Among the designs shown in this catalogue are, in addition to the above, a variety of fancy ridge and weather tiles, hip covers, weather boards, finials, &c.

LONDON WATER COMPANIES' CLAIMS.

When the Court of Arbitration appointed under the Metropolis Act of last Session meet on October 25 next they will, says the *Standard*, have before them the claims of the eight metropolitan water companies, amounting to 50,000,000*l.*, in addition to their debenture stock being taken over by the newly-created Water Board. On Tuesday the Water Board deposited with the Court of Arbitration their answers to the claims of the East London and the New River Companies, from which a fair idea can be formed of the views which will be laid before the Court by the water companies and the Water Board respectively as to the value of the water undertakings. An analysis shows that the total claims of the eight companies amount in the aggregate to about 50,000,000*l.*, in addition to their debenture stocks. It appears that the total aggregate of the companies' ordinary capital (representing the whole sum expended by them on their undertakings from their origin until about the year 1886) is 10,323,000*l.* Since that date the companies have not been permitted by Parliament to augment their ordinary capital, and all money required for further works has been raised by debenture

stock charged upon the undertakings. These debenture stocks amount in the aggregate to about 10,000,000*l.*; the whole of which is to be transferred to and taken over by the Water Board. The claim of the companies is thus, in effect, that the Metropolitan ratepayers should relieve them from the 10,000,000*l.* debenture stock liability, and pay, in addition, about 50,000,000*l.* in respect of works. The claim of the East London Waterworks Company, which will be first presented to the Court, shows that the capital of the company consists of—Debenture stock, 2,051,000*l.*; and of ordinary share capital, 1,720,000*l.* The debenture stock of 2,051,000*l.* is transferred to and taken over by the Water Board, and in respect of their nominal capital of 1,720,000*l.* the East London Company claim sums amounting in the aggregate to 7,214,000*l.* The reply of the Water Board is generally to the effect that over and above the 2,051,000*l.* charged, which they take over, they are not prepared to offer any further sum of money in respect of the undertaking. The capital of the New River Company comprises the following:—Nominal share capital, 2,019,000*l.*, and the debenture stocks amount to about 2,250,000*l.* As in the case of the East London Company, the debenture stock of 2,250,000*l.* is transferred to and taken over by the Water Board, and in respect of their nominal share capital of 2,019,000*l.* the New River Company claims under various heads an amount of 11,666,000*l.* The main point of the answer of the Water Board is that the sources of water supply which the company are entitled to bring into account for the purpose of their claim will be wholly insufficient to meet the demands of the population of their district. Finally, the Water Board indicate that in addition to the liability involved in taking over the debenture stocks of the company (which, as already stated, will amount to about 2,250,000*l.*), they are willing to pay in respect of the undertaking of the company the sum of 3,000,000*l.*, a figure more than sufficient to repay the company the whole of the money which has been expended by them upon the undertaking.

Institution and the Institute of Builders. The result has been the formulation of new by-laws, under which it is insisted that in the future before any demolition takes place all windows and other openings in the external walls shall be close boarded. Canvas or boarded screens, mats and other suitable appliances must be used whenever required, and so placed as to reduce the nuisance arising from the escape of dust. Rubbish, lime or mortar must not be shot or allowed to fall from floor to floor into any basement within 20 feet of the public way between 10 A.M. and 6 P.M., except on Saturdays, when it will be permitted after 3 P.M. Further, no materials arising from the demolition of buildings shall be basketed, wheeled or loaded into carts or carted away between 10 A.M. and 6 P.M., except on Saturdays, unless proper provision has been made for the protection of the public from dust. Any person who commits a breach of the new by-laws will be liable to a fine of 5s. for each breach.

EASTON'S EXPRESS ELECTRIC LIFTS.

THE money which is wasted in England on what may be called circularising is incredible. If those documents were limited in size to four pages of note-paper, or the postal two ounces, no great loss would be incurred by the senders. But there seems to be a competition still worse than those for buildings, in which the game is who can produce the largest and costliest volume without the least chance of remuneration. For specialists, and particularly architects, make a rule that all such presents are to be cleared from their offices before the working hours begin. It is well to have descriptive catalogues of products and manufacturers always ready, but prudence dictates that they should not be despatched to busy people until application is made for them. Demand should precede supply. The public in general are imitating the example of professional men, and costly examples of printing and design are ruthlessly condemned to the dustbin. They have become so numerous that in many districts the collectors consider them to be inferior to rubbish and decline to remove them with the ordinary domestic debris. Why should an unoffending occupant of a house have to pay tips in order to be clear of such incumbrances? Is it any wonder there is a prejudice against that class of stuff? It has been produced too abundantly, and as obsolete it is despised. The inventiveness of Messrs. Easton & Co., Ltd., already exemplified in many

fields, has produced one novel substitute which deserves grateful recognition. They have taken the time-table which is most used in London and have supplied a substantial but artistically designed cover, which on one side has an announcement of their Express Electric Lifts. The combination of green, red, white and black in the composition is pleasing. The idea will bear imitation. Why should not enterprising manufacturers supply similar covers for one's favourite journal or French novels, of which the yellow exteriors deteriorate more quickly in England than abroad? Even Mr. Balfour would not object to adopt so handsome a protection for his favourites. The cover to the time-table is, besides, peculiarly appropriate, for it recalls the long and honourable connection of Easton & Amos, Easton & Anderson, and Eastons, Limited, with railways, not only in England, but in most parts of the world. Besides, what is an electric lift but a miniature railway with a perpendicular instead of a stiff gradient, and having driving gear, brakes, locking apparatus and everything needed for expedition and security? Messrs. Easton's are not only of English design, but entirely of English manufacture. They are widely appreciated, for among recent contracts received by the company are lifts for the London County Council, the Admiralty, War Office, H.M. Office of Works, the Midland Grand Hotel at Manchester (nineteen lifts). Orders have been given by many members of the aristocracy and many leading architects all over the British Isles. Easton's electric lifts are being shipped to South Africa, Australia, China and other British Colonies at the moment, and wherever they are used they realise all that is promised.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

SIR FORTESCUE FLANNERY, M.P., presided, on Friday, the 7th inst., at the award of certificates to the successful students of this school, on the close of the summer term, and among those present were Mr. J. W. Wilson, principal; Mr. Maurice Wilson, vice-principal; Mr. Botham, assistant manager Crystal Palace Company; Mr. J. Boraston, and the three examiners, Mr. H. C. H. Shenton, Mr. Grote Stirling and Mr. William Pollard Digby, who were old students of the school.

The Vice-Principal read the names of the students who had gained certificates.

The Chairman said the very favourable reports of the examiners indicated that the school was continuing to do

its share in the great national work of technical education. We had a rude awakening a short while ago by seeing our markets flooded with the productions of other countries, and some of our trades seriously injured by foreign competition, and Englishmen began to look about to see how such a state of things could be remedied. The first and most important step towards that end was obviously to improve the technical education, not only of our artisans, but also of those of the higher grades who would have to direct those artisans. He did not think the injury that had been done to our trade could be exaggerated. In his own daily work, he was sorry to tell them, he had had to sanction, within the last few months, German manufactured plates worked into British-made boilers, and German forgings worked into the shafting of British-built engines. The reason he had to do so was simply this, that if he had objected to the German-made boiler-plates and shafting it would have been impossible for the British contractor to have competed successfully with the German contractor for the whole of the work instead of only a part of it. It was a startling fact that the British manufacturer or contractor could not compete with the German and American unless he incorporated German material into the work he had to execute, and it ought to convince everybody of the importance and urgency of thorough technical instruction in our schools. The German method, system of organisation and technical training were remarkable, and he believed their success was as much due to that as to the superior scientific and technical knowledge in the case of many of their leading managers and engineers. We were now moving in the right direction, however, and he was sure we should overtake the Germans in regard to technical knowledge, but whether we should do so with respect to organisation and method he was not quite so sure. Technical education was now being carried out in the country on the right lines, and we should soon feel the benefit of it. In that school they were marching with the times, and he thought the directors were very wise in adding an electrical branch to the curriculum, for no engineer could now be competent without a knowledge of electricity. He was glad to note the steady progress in adaptability which had been made in the school during the last few years, and congratulated the Principal on its success.

Votes of thanks having been passed to the examiners and the chairman,

The Principal stated that the school now contained over 100 students, as many as could be accommodated. During its

existence 1,600 students had passed through it, and a large proportion of them were now occupying good positions in all parts of the world.

DOVER HARBOUR.

THE new harbour works which are being carried out at Dover by Messrs. S. Pearson & Sons include over two and a half miles of pier and breakwater and will make Dover the largest artificial harbour in the world. The sheltered area, capable of receiving the largest warships and Atlantic liners, will be 685 acres, or considerably over a square mile of water space. Dover intends to make a bid for Transatlantic traffic, though the works will take ten years to complete, London will have to put her house in order if her docks are to maintain their position. The work of building the enfolding semicircle of breakwaters, including a pier 320 feet wide, with a comfortable station for continental traffic, is made extremely difficult by the great rise and fall in the tide, the strength of the current and the heavy traffic of the port for shipping and mail boats are continually coming and going. Yet the vast seawalls are being built with the exactness and care of a neat Thames-side villa. There is none of the tumbling of stone rubble into the water until a mountain has made reaching to the surface, as in the case of the breakwater at Plymouth. A steel staging is erected over the water, grabs "grabs" excavate the bottom till the solid foundation rock is reached, and then men go down in diving bells 17 feet by 17 feet and make a level bottom. After this the "Goliaths" or steam masons pick up the great blocks of artificial stone, some of them weighing 40 tons, and lower them into the water, where they are fixed in position and cemented together by divers. Those which will face the water are faced with granite, which was built in the side of the mould before the concrete was poured in. It seems as though the Government in projecting this great national harbour contemplates building for eternity.

their secretary (Mr. Lynden L. Macassey) will leave on August 28 to make the necessary arrangements. The commissioners are expected to return about the middle or end of October. They will visit, among other places, New York, Boston, Philadelphia and Chicago. The most important of their duties will be to look closely into the comparative merits of subways and tube railways. On their return the commission will resume their sittings in November. Up to the present time they have been concerned mainly with the evidence of the London County Council, which is not yet quite finished, and they will proceed with witnesses from the municipal borough councils and other local authorities in the vicinity of London who are interested in the question of metropolitan transit. Afterwards they will receive evidence from the great railway companies and tube railway companies. The commission do not intend to report on the locomotion in London until they have personally examined into the means of transit which exist in the great cities of America and Europe. The report will probably be presented to Parliament at the close of next year. The commissioners visiting the United States are Sir David Barbour (chairman), Lord Ribblesdale, Sir Francis Hopwood (permanent secretary of the Board of Trade and formerly secretary of the Railway Department), Sir John Dickson-Poynder, M.P., Mr. George Gibb (general manager of the North-Eastern Railway), Sir George Bartley, M.P., and Mr. Lynden L. Macassey, secretary.

IMPORTATIONS OF IRON AND STEEL.

In a letter to the *Times* Mr. M. Deacon, C.E., writes:—
A few simple examples of the effect upon the British iron and steel trades of the free admission of foreign manufactured goods into this country may be interesting to your readers and of some value in the general consideration of the question.
Several years ago the import of American manufactured goods commenced in real earnest, pig iron being imported into Liverpool and Manchester at prices which defied competition by English makers. American steel billets and bars for manufacturing into black-plates, tin-plates, corrugated sheets, bars, angles and tees were freely imported at lower prices than similar materials could be made by English makers.
The result of this was that in some districts, especially in South Wales, some steel works had to be closed, whilst others

ran on very short time, large numbers of men were thrown out of employment, and others received only one-half the necessary wages to keep themselves and their families in the ordinary comforts of life.

The occurrence of the American boom, which is now on the wane, fortunately put a temporary stop to the import of these goods, with the result that during the last four or five years employment in the iron and steel trades of this country has much improved, and the workmen have been able to earn better wages.

The benefit derived from the cessation of American imports was, however, counteracted to a great extent by the influx of German iron and steel goods which immediately followed. At the present time, steel ingots, billets and bars are being imported from Germany into South Wales at prices fully 5s a ton less than the cost of production in England. This has resulted in a scarcity of orders to the English maker, and consequently in a considerable reduction in the weekly earnings of steel workers. German bar iron is imported into the heart of the country, and actually competes with the commoner classes of Staffordshire iron in its own county.

The bar-iron trade is and has been for some time so depressed that many mills are only running from three to four days a week, and the workmen have consequently to go so much short in their wages.

Cast-iron pipes manufactured in France are being imported into this country, especially into the south of England, at prices which defy competition by the English maker, and they have even been successful in penetrating into the Midland counties at prices lower than local manufacturers are able to quote.

The ability of our foreign competitors to beat us in our own markets is attributable in the case of (a) America, to their richer and cheaper iron ores, their more cheaply worked coking coals and the more modern plants which they have generally adopted, in the full knowledge that their natural resources warrant the expenditure; (b) Germany, Belgium and France, to the lower wages and longer hours which their workmen are contented to receive, to the low railway rates, and in some instances to the bounties granted on exported goods and to the fact that this country is used as the dumping ground for their surplus productions at prices under cost, for the purpose of reducing their costs to a low figure, in order that they may make a profit in their home markets.

JENNINGS' PATENT "TIP-UP" AND LIFT-OUT LAVATORIES FOR Hospitals, Infirmarys, Schools, Hotels, Clubs, Railway Stations, Offices, and every description of Building, Public and Private.

HIGHEST AWARDS AT EVERY EXHIBITION.

The simplicity, freedom from complication, and efficiency has caused this system to be universally adopted, while its cleanliness and saving of time, effected by the instantaneous discharge, is greatly appreciated. The deposit left round the plug hole basins is not only objectionable, but is considered by medical men to be too often the means of communicating disease.

This system has been adopted in Buckingham Palace, Windsor Castle, Marlborough House, and in the Residences of Royalty, the Nobility and Gentry, the principal Clubs, Hotels, Schools, &c., throughout the world, and as a guarantee of efficiency bears the name and address of the Patentee.

GEORGE JENNINGS, LIMITED,
BY SPECIAL APPOINTMENT SANITARY ENGINEERS TO H.M. THE KING,
AMBETH PALACE ROAD, LONDON.
Telegrams, "JENNINGS, LONDON." PARTICULARS ON APPLICATION.

What will be the position when the United States' enormous production can no longer be consumed in their home markets? I venture to predict that it will prove to be such a severe blow to the trade of this country, that the eyes of the British public will be opened to the fact that it is at last time to depart from our conservative methods and to apply their reasoning powers to the existing and probable future condition of things, rather than rely upon methods which were adopted under totally different circumstances and which no longer exist.

VALUATION OF BUILDINGS.

A DRAFT report has been prepared by the Lord Advocate, as chairman of the select committee directed to inquire into the Valuation Acts as relates to rateable property. It states at the outset the committee found that considerable materials for the matters under consideration already existed in the evidence led before and reports made by the Royal Commissioners on Local Taxation.

In considering the question the committee were of opinion that it would be well to have before them the system of valuation which obtains in England and Scotland, and accordingly they examined Mr. Adrian, of the Home Office, and Mr. Henry, the assessor of Glasgow.

The subject of the valuation of rateable property naturally divides itself into two branches. First, the principles of valuation, and second, the machinery by which valuation is to be effected. As regards the principles of valuation, the committee do not think that there is much room for doubt. What is wanted to be discovered is the annual value of any hereditaments, or, as it is often expressed, the letting value. Where there is a free market there can obviously be no test so good as the rent which is actually paid for the subjects. After arriving at this value there will then fall to be made such deductions as are necessary to be subtracted before you can arrive at the actual beneficial value as enjoyed by the owner. The words in which this principle may be expressed somewhat vary, but it is probably sufficient to quote the definitions which have been given in England, Scotland and Ireland to see that the feeling of Parliament in all cases has been substantially the same. In England, for example, the most elaborated system is to be found in the Metropolitan Valuation Act of 1869. There gross value is defined as meaning "annual rent which a tenant may reasonably be expected taking one year with another

to pay for a hereditament if the tenant undertook to pay the usual tenant's rates and taxes and tithe commutation rent charge, if any, and if the landlord undertook to bear the cost of the repairs and insurance and the other expenses, if any necessary to maintain the hereditament in a state to command that rent," and "rateable value" was at the same time defined as meaning "the gross value after deducting therefrom the probable annual average cost of the repairs, insurance and other expenses as aforesaid."

In Scotland the 6th section of the Act for the Valuation of Lands and Heritages provides that "in estimating the year value of lands and heritages under this Act, the same shall be taken to be the rent at which one year with another such lands and heritages might in their actual state be reasonably expected to let from year to year, and where such lands and heritages consist of woods, copse or underwood, the year value of the same shall be taken to be the rent at which such lands and heritages might in their natural state be reasonably expected to let from year to year as pasture or grazing land; and where such lands and heritages are bona fide let for a yearly rent conditioned as the fair annual value thereof with the gross sum or consideration other than the rent, such rent shall be deemed and taken to be the yearly rent or value of such lands and heritages in terms of this Act, provided always that such lands and heritages be let upon a lease the stipulated duration of which is more than twenty-one years from the date of entry under the same, or in the case of minerals more than thirty-one years from such date of entry, the rent payable under such lease shall not necessarily be assessed as the yearly rent or value of such lands and heritages, but such yearly rent or value shall be ascertained in terms of this Act irrespective of the amount of rent payable under such lease. . . ."

In Ireland the valuation of houses and buildings in the Valuation Act is "the net annual value," that is to say, the rent for which, one year with another, the same might in its actual state be reasonably expected to let from year to year, the probable average cost of repairs, insurance and other expenses (if any) necessary to maintain the hereditament in its actual state, and all rates, taxes and public charges, if any (except tithe-rent charge), being paid by the tenant.

All these definitions, though variously expressed, obviously seeking the same result, and the committee are of opinion that really no other principle is possible where you are dealing with valuation which is to be the basis of rating from year to year.

HIGHEST AWARDS:
EXHIBITIONS 1891-93-94-95-97.

PRICE LIST AND ESTIMATES ON APPLICATION
LANTERN SLIDES ON HIRE.

So far as the application of this principle to lands and buildings in town are concerned, the committee see no greater difficulty in applying the criterion of actual rent (or, where actual rent is either not got, or from various reasons does not represent the true annual value, the rent as supposed to be paid by the hypothetical tenant) to the circumstances of Ireland than has been found in its application to England and Scotland.

Turning now to the machinery by which valuation is effected, the first fact that confronts us is that the Irish system as it exists, differing in this respect from both the English and Scotch, is a centralised system, the whole business being done by a Government department conducted by Government officials.

The first point that arises is whether the centralised system should be continued or something else should be substituted in its place. We have come unhesitatingly to the conclusion that it would not be wise to disturb the existing system in this main feature. To those in search of a theoretically perfect system of valuation there is little to be got from the example of England, with its system of valuation differing in various parts of the country, and differing as regards the various practices. In point of fact the English system is not properly a system of valuation at all. As is pointed out by Mr. Adrian, in England the system of valuation is always determined by the statute authorising the taxation.

By a system of valuation proper the committee understand a valuation which is arrived at as a basis of taxation, but which has nothing to do with any particular taxing statute. The possible exception to this in England is to be found in the Metropolitan Valuation Acts, which provide for valuation for wider purposes than is done in other parts of the country, but those Valuation Acts apply only to London, which is obviously a very peculiar and unique subject, and we do not think that their provisions, with, among other things, a quinquennial revaluation, would be at all apposite or desirable for Ireland.

In Scotland the system of valuation is theoretically better, and in practice works exceedingly well. But in Scotland the system, although not theoretically centralised, in practice is almost so. The assessors who manage the whole valuation, although appointed by the local authority, are quite independent of that local authority so soon as appointed, and the temptation to take the Government assessor is so great that in practice the large body of the assessors in Scotland are comprised of Government officials. They meet yearly and

compare notes, and it may be said without hesitation that the practice in Scotland is just as uniform as it is under the centralised department in Ireland. Further development in Scotland, as has already been said by the Royal Commission on Local Taxation, is likely to make the system rather more than less centralised.

Further, the Irish system, as it is, has worked well so far as the Department is concerned. Many of the witnesses made suggestions, but few had the hardihood to suggest that the central department should be abolished altogether, and those who did, who recommended that local authorities should be the valuation authority, seemed hardly to realise that valuation practice at the present is a matter outside their professional experience, and undoubtedly must be entrusted to some practical person. On the whole the testimony as regards the way in which the Irish Valuation Department did its work in the past was decidedly favourable.

Some of the witnesses while agreeing that such anomalies had crept into the valuation of buildings in Ireland as to call for a new valuation, objected to any revaluation which would have a tendency to raise the total valuation, upon the ground that imperial contributions would thereby increase, and that that would be an infringement upon the state of the financial relations between Great Britain and Ireland. Sir John Barton in his evidence gave somewhat substantial reasons for thinking that the difference in the matter of income tax would be but small, but quite apart from this we consider that these considerations, even upon the assumption that such would be the result, are beyond the scope of this inquiry. If the inequity of the financial relations of Ireland to Great Britain be assumed, we think it is obvious that the correction lies in a graduation of the tax or taxes, but not in an attempt to put the system of valuation on any other than its only true basis.

THE NEW CODE AND OLD BOARD SCHOOLS.

THE borough education committee of Kingston engaged Mr. T. J. Bailey, architect to the London School Board, to report upon the repairs, alterations or improvements which are necessary and may be reasonably required by the Corporation education committee in order to render them in a fit state for the proper carrying on of elementary education. He wrote:—

As requested, I submit a detailed report in each of the

seven cases, showing the present condition of the buildings and what I consider necessary to be done in order that the new education committee may have proper buildings in which to carry on the work, bearing in mind the clause 85, sub-section (2) of the Provisional Code, 1903, which states:—"The school premises must be healthy, properly constructed and arranged for teaching, lighted, warmed, cleaned, drained and ventilated, supplied with suitable offices, and contain sufficient accommodation for the scholars attending the school."

On the question of accommodation the Provisional Code states:—

"Subject to the conditions laid down in the body of this article being fully satisfied, schools already on the annual grant list will as a rule be regarded as accommodating the number of scholars for which they have been hitherto recognised by the Board, provided that in no case there shall be less than 80 cubic feet of internal space and 8 square feet of internal area for each unit of average attendance."

But this is manifestly only provisional and tentative inasmuch as it is at so much variance with the Code for new buildings, which requires as follows:—

"It is important to remember that the accommodation of every room depends not merely on its area, but also on the lighting, the shape of the room (especially in relation to the kind of desk proposed), and the position of the doors and fire-places."

"Both schoolrooms and classrooms must have independent entrances. Every room should be easily cleared without disturbance to any other room."

"The accommodation of a school for older scholars is based upon the number of children who can be seated at the desks, provided that a minimum of 10 square feet of floor space per child is obtained."

"A space in which the children (infants) can march and exercise should be provided. A corridor intended for this purpose should not be less than 16 feet wide."

"The accommodation of an infants' school is based upon the number of children who can be seated at the desks, provided that a minimum of 9 square feet of floor space per child is obtained."

As it must be considered that if the Code for new buildings requires only what is necessary for proper teaching in respect of healthy conditions, absence of overcrowding, proper ventilation and separation of classes, this method of calculating the accommodation is much more necessary to be observed in old

buildings, where the various points have not been so studied or observed as in new buildings planned and constructed according to modern lights and in accordance with the modern code.

Bearing these points in mind, I do not consider that the attached suggestions for improvement are at all unreasonable, inasmuch as by the Provisional Code quoted the schools will continue—at least for a time—to give accommodation to at least 25 per cent. more in the graded departments and 12½ per cent. more in the infants' departments, than the Code allows for in the buildings.

I attach a sketch plan in each case showing in red ink the numbers that I consider the schools could properly accommodate and the suggestions I would make by way of adapting the buildings, where feasible, for the purpose, although they nearly all come short of the Code requirements. In the case of the public schools (boys and girls' departments), I find myself unable to make any suggestion for improving these buildings, their general plan and arrangements being of such a nature, and their age and condition such, that money spent upon improvements, which could never be satisfactory, would be completely wasted.

With regard to the sanitary appliances of all the schools, generally they are in very bad condition. Some are of modern erection (one only just in process of construction), but I am bound to express a general condemnation in view of the laws of the borough, and in face of which the whole—even the best of them—may be condemned and ordered to be reconstructed at any time on the initiative of the medical officer or borough surveyor. The drainage of the various schools I have not been in a position to report upon, but, judging from the condition of the office blocks, I should be very suspicious of the older cases, and would suggest, in view of the possibility of a condemnation and order to reconstruct at any time, that the medical officer and sanitary surveyor of the borough be requested to report on their efficiency.

ELECTRIC ACCUMULATORS.

The following letter has been issued from the Home Office—
Home Office, Whitehall: August 10, 1903.

Sir,—Adverting to the letter addressed to you from this department on August 25 last, stating that the Secretary of State proposed to make regulations under Section 79 of the

Factory and Workshop Act, 1901, for the manufacture of electric accumulators, and to the further letter sent to you by the Chief Inspector of Factories in June, I am directed by the Secretary of State to transmit to you the enclosed draft of such regulations. The regulations proposed to be made have been communicated to the manufacturers concerned, and modifications have been made to meet as far as possible the objections taken to some of them. These modifications have been embodied in the enclosed printed copy, and the Secretary of State understands that the trade generally are satisfied that the regulations are reasonable, and will be prepared to carry them out.

In accordance with the requirements of the Statute, the regulations are now formally issued in draft, and I am to add that they are subject to further consideration. If objections of substance are taken to them by the employers, by the workpeople, or by any persons affected by the regulations, these objections will, under the Statute, be the subject of full inquiry by a competent person appointed by the Secretary of State, and the report of the person holding the inquiry will be considered by the Secretary of State before the final regulations are made. At the inquiry, employers, owners, occupiers and workpeople, and all others concerned, will be entitled to a full hearing. If, therefore, any person desires the rules to be further considered, he should lodge objection in accordance with Section 80 of the Factory Act, and in pursuance of that Section the Secretary of State gives the following notice:—

"That he proposes to make regulations dealing with the manufacture of electric accumulators, in accordance with the enclosed draft, copies of which may be obtained on application to the Factory Department, Home Office, London, or at the local office of the inspectors of factories, and that any objections with respect to the draft regulations by or on behalf of any person affected thereby must be sent to the Secretary of State within forty days from this date. Every such objection must be in writing, and must state (a) the draft regulations or portions of draft regulations objected to; (b) the specific grounds of objection; and (c) the omissions, additions or modifications asked for."

It should be understood that, as was stated in the letter of August 25, 1902, the regulations will be in substitution for the special rules for electrical accumulator works made under the Factory Act of 1891, and it will be observed that they are to come into force on October 1 next.—I am, sir, your obedient servant,

KENELM E. DIGBY.

INSPECTION OF PIPES.

INSTRUCTIONS have been issued by the Bureau of Filtration Philadelphia, for the guidance of inspectors of cast-iron pipes, special castings and stop valves. In accepting material it is said inspectors are hereby directed to exact rigid compliance with all the requirements referring to the shape, size, thickness, eccentricity and soundness of all pipes, special castings and stop valves therein specified, and with the requirements referring to the quality and tests of metal to be used. No deviation whatever from these conditions will be permitted on the part of the inspectors, and in cases where material has been rejected which, in the opinion of the contractor might be used, the exact cause of rejection must be reported promptly to the chief engineer's office in order that it may be determined whether the rejected pieces can or cannot with safety be accepted. No deviation whatever from the contract requirements will be permitted by the inspector, except upon written orders, signed by the chief engineer.

All pipes, special castings and stop valves must be consecutively numbered whether the pieces be accepted or rejected; the test bars must also be numbered and the series of numbers for each be connected with the numbers of the pipes, special castings or stop valves manufactured from the same heat. For other than 60-inch pipe there will be required from each heat two test bars for cross-breaking loads and two tensile test specimens. Not less than six test bars for cross-breaking load shall be made from every heat for 60-inch pipe and special castings. These test bars must be taken at different times during the heat in order to show the quality of the metal at the beginning, during and at the end of the heat, as represented by the material drawn into the ladles and poured into the flasks. Thus if the heat for 60-inch pipe requires three hours to pour off, a test bar should be run from the first ladle and one every half-hour thereafter during the heat until the proper number of bars are obtained. If the heat consumes six hours a cross-breaking test bar must be poured each hour, and a tensile test bar once each two hours of such heat, or in this order whatever the length of time to pour off the heat for each particular day. The test bars in each instance must be taken from the same ladle which carries the molten iron from the cupola to the flasks. If the special castings are not poured from the same cupola as that supplying material for pipe, then the test bars must be duplicated from the cupola

supplying the material for special castings. Where the one cupola supplies the material at the same time for both pipe and special castings, the test bars will be held to apply to both the pipe and special castings.

The inspector will be required to see that the bars for cross-breaking tests, and the three additional bars cast separately and milled for tensile tests, are boxed up and forwarded to the chief engineer's office regularly each day by express. The duplicate set of cross-breaking bars and tensile test bars, which the foundry will make, will be broken and deflections determined on the testing machine at the foundry. The inspector will be required to be present when these tests are made and certify to the results, and any casting made from metal falling below the requirements of the contract, even though otherwise satisfactory, shall be rejected.

Inspectors will note that each pipe must be subjected to an internal hydrostatic pressure of 300 lbs to the square inch, for an interval of time not less than ten minutes, or longer if in their judgment it is necessary to prove that such pipe is tight and not sweating through the pores of the metal. This test must absolutely be made with every piece of pipe and special casting, excepting curves and breeches pipes, the inspection of which must be made to show absolute compliance with the other requirements of the contract, because these specials cannot conveniently be subjected to the hydrostatic test. In the case of rejection of curves or breeches pipes, because of their non-compliance with the requirements for form, uniformity of thickness of barrel, &c., if the contractor will arrange to subject such castings to the hydrostatic test, and they are found to meet such test satisfactorily, this fact must be reported to the office for such further action as the chief engineer may take with reference to such special castings.

Note the preparation of the coating bath and see that the same is kept at the proper consistency and at the required temperature, also that the castings before immersion are carefully cleaned and heated as required. See that the castings are kept in the bath long enough to become thoroughly coated inside and outside. The inspector shall see that in heating pipes in the oven before they are put into the bath of pitch and oil they are not brought to a temperature high enough to burn the material in the coating tank. The oven for heating pipe and special castings must be fired with coke or anthracite coal. The clause on "Defective Bead Ends" must be construed as applying only to pipe 48 inches and less in diameter. No provision is made for cut 60-inch pipe, and if occasion should

arise where it might be advisable to cut such pipe, specific instructions with reference to banding will be furnished.

If the foundry should not be provided with calipers having a reach of 5 feet, with a self-reading scale whereby the thickness of the pipe at any point in its length or diameter can be quickly read, he shall notify this office and such calipers will be furnished, to be returned when he has completed his work. In calipering pipe for thickness of metal it must be taken near the bell and near the spigot, and at two points equidistant between the bell and spigot, and at four points, 90 degrees apart around the circumference, and if upon this measurement there is reason to believe that the thickest and thinnest sections of the pipe have not been shown, then it will be necessary to continue until the extreme difference of thickness has been stated. In calipering pipe for diameter of bore, this should be taken at four points.

Upon inspection of special castings for all requirements with reference to thickness of flanges, barrels, dimension depths and condition of bells, sizes and condition of bevel facings of flanges, diameter of bolt circle, number and size of bolts and other ordinary conditions, a careful examination must be made for spongy spots where the flange joins the reinforcement of the casting and the bell joins the barrel pipe or casting. This can best be done with a blunt pun and hammer, and wherever such parts are suspected the pun and hammer must be applied until the inspector is satisfied the metal is solid. Spongy spots in the iron where the flange joins the reinforcement or the bell joins the barrel will be considered sufficient cause for rejection.

Where the flanges do not face up smooth and free from blow holes and sand holes, such castings will be rejected, all the facts reported to the chief engineer. In reporting castings so rejected the inspector should make a sketch of the flange and indicate on the same the location, number and size of the spots which do not face out in the lathe or in the boring machine. The back of all flanges shall be smooth, parallel to the faced surface, and furnish a proper seat for nuts and bolt head.

Submit daily reports to the office of all pipe, special castings and stop valves made under the contract, either accepted or rejected, giving the data called for in the blanks furnished. If subsequent examination of castings, after arrival upon work at Philadelphia, should indicate neglect upon the part of the inspector at the foundry it will be deemed sufficient cause for its removal.

The Architect.

THE WEEK.

THE International Congress of Hygiene and Demography will begin on Wednesday next, September 2, at Brussels. There will be a preliminary meeting of the members on Tuesday evening at the Artistic and Library Club House. The proceedings of the Congress will be opened at the Palace of the Academies by Prince ALBERT, at 9.30 A.M., on Wednesday. The sections of the division of hygiene will meet at the Palais de la Nation at 2 P.M., and those of demography at the Palais des Académies at the same time. They will be continued until September 8. On Thursday evening there will be a "raout" at the Hôtel de Ville, on Friday a special theatrical performance, on Saturday an excursion to Tervueren, on Sunday an excursion to Antwerp, where there will be a municipal reception and luncheon; on Monday a banquet, and on Tuesday evening the King of the BELGIANS will give a "raout" at the palace. On the day after the congress closes there will be excursions to Spa, Barrage de la Gileppe and to Bourgoumont. The subjects to be discussed at the meetings will correspond with those of our sanitary congresses. The Belgian organisers have been able to secure more general co-operation than has been yet attained in England.

NATURE does not appear to be disposed to allow oblivion to retain a hold on the reputation of able painters, for sometimes by trivial accidents their names come again into light. The latest instance is RIDOLFI GUARIENTO. By misspelling his name VASARI veiled his merit. He wrote:—"A much better master than MORZONE was the Paduan painter GUARIERO, who, in addition to many other works, adorned the principal chapel of the Eremite monks of Sant Agostino in Padua; with another chapel in the first cloister also for those monks. He likewise painted a small chapel in the palace of Urbano Prefetto (capitano), and the hall of the Roman emperors where the students go to dance in carnival time was also painted by him. In the chapel of the Podesta there are, besides, events from the Old Testament painted in fresco by this master." In addition GUARIENTO, who in the fourteenth century was considered a master, painted a *Last Judgment* in the Council Hall of the Doge's Palace in Venice. It was destroyed by fire and then a commission was given to TINTORET to paint the immense picture familiar to all visitors. He was then an old man, and there is no doubt the work has suffered through restorations, so that its meaning is not entirely clear. By some it is considered as being a representation of Paradise. As the picture measures 84 feet by 34 feet, and is crowded with figures, there arises some excuse for uncertainty. It has been found necessary to clean the immense work, which is painted in oils on canvas like an ordinary easel picture, and it has had to be removed. It was stretched on a wooden framework. On the wall it was discovered that some fragments of GUARIENTO's work were still to be seen. It is concluded that the old fresco bore some analogy to the later painting, for it contains a very large number of angels, prophets and patriarchs, with CHRIST in the midst. The whole of the wall has not been freed from the framing, and it is therefore hoped that some further fragments will be revealed. The fresco was injured, as we have said, during a fire, and for that reason was superseded by TINTORET's work. In quality the fragments are equal to the best of the few works ascribed to the Paduan master.

THE appearance of the earliest wood-engraving, which has given rise to much discussion, may be revived by a pamphlet written by the Prince D'ESSLING relating to the book or series of prints exemplifying that art. It is impossible to say how remotely the origin of the art is to be traced. One authority says that in 1284 two youths of Vienna cut and printed a series of compositions treating of the history of ALEXANDER THE GREAT. But all examples have disappeared. EMERIC DAVID, who wrote so much about art, believed in the legend. The famous

"St. Christopher," of which a copy appears in all histories of wood-engraving, dates from 1423, but it does not seem to have formed part of a series. According to the Prince, there is in the Gallery of Engravings at Berlin a series called "Devote Meditationi sopra la Passione," which was printed in Venice in 1477. Three copies are known. Some inquirers believe the blocks were produced in Germany, and there seems to be no doubt that similar plates were found there. But there are some characteristics denoting an Italian origin. There is an absence of backgrounds. There are no clouds in the out-of-door scenes, and when the country is represented it has the conventionalism seen in early Italian works. Possibly the engravers assumed that their plates would be completed by the aid of hand colouring, and the Berlin example is coloured although faintly. A similar work, known as the "Speculum Humanæ Salvationis," was popular in Holland and Germany. It is said an edition was produced as early as 1442, but the most ancient edition known is dated 1483, and the majority of the existing examples were produced a hundred years afterwards. The subject is, therefore, rather perplexing. Wood cutting has, moreover, almost become a lost art, and it would be an advantage if interest in the art were revived, if only by means of controversy on its origin.

It has often excited wonder that modern residences should be erected after the form of buildings used by Romans, if not ancient Greeks, and by Mediæval monks. A Swiss manufacturer of silk has gone further backward, for he has had constructed for his own use a pile dwelling in Lake Constance at a distance of about 200 feet from the shore. It has been formed as exactly as possible in imitation of the Swiss lake-dwellings exhibited in the Zürich Museum. Around the house is a gallery 5 or 6 feet wide. The exterior of the walls is covered with osiers and lime. The floor is of plaster and the roof is thatched. Instead of glass, bladder is used. Wood of the yew has been employed as far as possible. It is a freak, but we suppose among those who ridicule it no architects are to be found.

THE name of LUCAS SUNDER, who was known as CRANACH from his birthplace, has been made familiar in England by the engravings of his portrait of LUTHER. He was a friend of the reformer and one of the witnesses of LUTHER's marriage. He was a busy man, for he was court-painter to the Saxon Electors, and accompanied one of them on a pilgrimage to the Holy Land. He might have entered into the service of the Emperor CHARLES V., but he preferred captivity with the Saxon prince. At Wittenberg he was twice appointed burgomaster. In addition to his paintings he is said to have produced more than 800 woodcuts. His countrymen continue to admire his works, and there appears to be a likelihood that CRANACH exhibitions in different parts of the Empire will be held from time to time. Four or five years ago there was one in Dresden, and one has just been opened in Erfurt. It possesses the advantage of displaying several pictures which from the time they were executed were hung on the walls of the ducal mansion at Coburg. They were consequently not much known to experts or students. The works of father and son are sometimes confounded. KUGLER, although his book was issued under royal patronage, was not able to see any of those in the palace of Ehrenberg. The best of the paintings and woodcuts are now at the exhibition. The famous *Madonna* has been sent from Weimar, and this is the first occasion it has been exhibited in public. Most of the works are Scriptural, for before the Reformation CRANACH was a renowned painter of altar-pieces. The Germans, fortunately for themselves, did not witness any clearance of works of art from their churches like that which took place in England in the time of HENRY VIII., ELIZABETH and CROMWELL. A vast number of Mediæval and later examples up to the end of the fifteenth century are still jealously preserved. The high influence which has supported the Erfurt exhibition has obtained the concession of the loan of many of the masterpieces of CRANACH. Students of German painting should not permit the opportunity of studying this master to escape them.

HATFIELD HOUSE.*

ON Saturday evening one of the greatest of English statesmen quietly passed from this life in the mansion which had been occupied by his family for nearly three centuries. This is not the place to recount the history of ROBERT ARTHUR TALBOT GASCOYNE-CECIL, third Marquis of SALISBURY. That duty has been performed not only by many English journalists, but by able publicists in other countries. He was a son of Oxford, a Fellow of one of its colleges, and since 1870 he filled the office of Chancellor of the University. The bent of his mind was, however, towards physical science, and he found occasional relaxation from the cares of State in his laboratory at Hatfield. He was generous in subscribing towards the erection of churches, and there are cottages in the village of Hatfield which show his kindness as a landlord and his desire to recognise sanitation. But it is impossible to consider him as a patron of architecture or the fine arts. The owner of so noble a mansion as Hatfield House would not have desired a more suitable residence, and we are afraid he resembled the public man referred to by CARLYLE, who spoke strongly about the insincerities which follow the fine arts. He may also have considered that the ablest modern composition in painting or sculpture would be out of place among the relics of his family.

Lord SALISBURY looked on innovation of every kind, with the exception of science, as a public danger. It seemed to him to be absurd, as he said, that men should attempt to sail their ships and build their houses by *a priori* reasoning. The rule of thumb he declared to be safer than the rule of science, for "the magic force of habit and traditional attachment will give to the rough contrivances of ruder times an ease, and an elasticity, and a practical efficiency which are denied to the newest masterpiece of the wisest schemer in Laputa." That is the sort of belief we expect from the owner of an ancient house, and which from many associations is loved as well as admired. Hatfield House is hardly a symmetrical building, but it is comfortable and commodious. From such a home the late Marquis probably derived his scorn of those who sought after symmetrical arrangements and tried to introduce "the proportions of a geometrical figure into the institutions which are to secure the happiness and carry out the wishes of capricious, inconsistent, illogical mankind." Hatfield House from time to time had been adapted to suit the needs of more modern possessors, while still preserving the main features of its character, and his Lordship considered that was the only way for the Constitution to undergo modifications; there was no necessity for a change in the essential principle. The builder of the house, if he revisited it would recognise his creation, and why should not the framers of the English Constitution be surprised with its developments? Under any circumstances, he said, change is abstractedly an evil, and we doubt whether any alteration at Hatfield was entirely gratifying to him. But we need not pursue the subject. Houses can exert an influence over their occupants, and although Lord SALISBURY was so much of a nineteenth-century representative as to find employment in journalism, and to seek fortune in the Colonies, he might have imbibed many Elizabethan ideas from Hatfield, and thus continued the theories which came down from the CECILS.

We have mentioned the house as a family inheritance for nearly three centuries. The place was historic at a much earlier period. Like Ely Place in London, it was a part of the possessions of the bishops of Ely, by whom a palace was there erected. When ecclesiastical property changed hands by order of HENRY VIII. the king reserved Hatfield to himself. EDWARD VI. made it over to his sister ELIZABETH, and during MARY's reign she was under the care of Sir THOMAS POPE at Hatfield. He endeavoured to amuse his charge on one occasion by a pageant in the hall, for which he was rebuked by the queen. When it was ELIZABETH's turn to ascend the throne she held her first Privy Council at Hatfield. WILLIAM CECIL, who was a native of Bourne, in Lincolnshire, was her Secretary of State. It is believed that during her long reign she was only once able to visit the mansion. WILLIAM CECIL might be considered as Prime Minister of England for more than

half a century. His son ROBERT succeeded him in office. He was in communication with the Scottish king, and when JAMES I. attained the English crown CECIL was allowed to remain at his post. WILLIAM CECIL had erected another residence at Theobalds, where he was often the host of ELIZABETH. JAMES also visited the house, and was so pleased with Theobalds he offered to exchange Hatfield, which was royal property, for it, and entered into occupation in 1607. The new mansion at Hatfield was at once commenced, and was completed in 1611. ROBERT CECIL, who had been successively created Baron of Essendon, Viscount Cranborne and Earl of Salisbury, did not long enjoy it, for he died in May 1612. He was not more than sixty years of age, and his success was envied by his contemporaries. But in dying he said to one of his friends, "Ease and pleasure quake to hear of death; but my life, full of cares and miseries, desireth to be dissolved."

The house has been always in the possession of its descendants. The State bedroom remains in the same condition as when slept in by JAMES I. His son, CHARLES I., was an occupant, but against his will we obtain glimpses of it afterwards from the diaries of EVERARD and PEPYS. The former, writing on March 11, 1661, records:—"I went to see my Lord of SALISBURY's palace at Hatfield, where the most considerable rarity, besides the house (inferior to few then in England for its architecture) was the garden and vineyard rarely well watered and planted. They also shew'd us the picture of Secretary CECIL in mosaic worke, very well done by some Italian hand." PEPYS visited the place on July 22, 1661, and thus describes his impressions:—"I come to Hatfield before twelve o'clock, and walked all alone to the Vineyard, which is now a very beautiful place again; and coming back I met Mr. LOOKER, my lord's gardener (a friend of Mr. EGLIN), who showed me the house, the chapel with brave pictures, and, above all, the gardens, such as I never saw in all my life, nor so good flowers, nor so great gooseburys, as black nutmegs." On two other occasions PEPYS broke his journey there; of the last he wrote:—"Walked out into the large through the fine walk of trees to the Vineyard, and there showed them that which is in good order, and indeed a place of great delight, which, together with our fine walk through the Park, was of as much pleasure as could be desired in the world for country pleasure and good air. At that time the grounds must have been open to the public as they have continued to be. It was characteristic of the kindly spirit prevailing at Hatfield that on Saturday, although the owner was dying, the fine park was not closed. In the eighteenth century there was a restoration, but his alterations failed to satisfy HORACE WALPOLE.

It is generally asserted that the design of Hatfield House came from JOHN THORPE. But no information exists respecting it among the plans and sketches forming the "Liber Veritatis" he left behind. It has also been doubted whether THORPE was living after 1607. According to Mr. ROBINSON, who wrote a history of the building, the outlay for so large a work was only 7,631*l.* 11*s.* 3*d.* Stone-cutting by hand, which was largely employed, was cheaply executed at the beginning of the seventeenth century. One of the items in the accounts runs as follows:—"For cutting of 48 stone Lyons which stande out of the open worke of masonrye about the house, for 11 taxers more, for the carving of the pewheads in the chappell, the stone pedestalls in the open worke before the house, the chimney-peece in the upper chappell, and the Corinthian heads which stand on the top of the stayre cases on the North side of the house, all which comes to 130*l.* 14*s.* 2*d.* The chimneypiece referred to is likely to be one in JAMES's room, in which Doric and Corinthian columns, various marbles, bronze heads, &c., are introduced.

The style of the building will be evident from illustrations of the south or principal front. It is one of the most successful examples of the Italian Renaissance which was then in vogue. The brickwork is still in excellent condition and the colour is most pleasing to the eye. The wings project to an extent that would have been thought excessive, but were in the sixteenth and seventeenth centuries regarded as the most suitable arrangement. The central part is raised, mainly to display the arms of the Earl of SALISBURY; the bearings are sometimes supposed to be those of King JAMES, through whose influence the

* See Illustrations.

portion of the money expended on the building was provided. The arcade along the central division imparts variety and affords a contrast for the wings. The date of the completion of the mansion, 1611, is also introduced. The northern front has been treated in a simpler manner.

The interior expresses a richness that is not coldly Classical. The elaborate carving of the newels, the panels with heads of Roman emperors, the screens and escutcheons with various quaint figures and paintings, are characteristic of a time when the advantages of the repose to be derived from blank spaces were unappreciated. The grand staircase leads to a gallery 163 feet 6 inches in length. The walls are panelled in novel forms, and from the armour, cabinets and curiosities are suggestive of a museum. There is also a fine library containing valuable books and manuscripts. A description of the manuscripts is to be found in one of the volumes of the Historic Manuscripts Commission.

The paintings in Hatfield House mainly consist of portraits of members of the family or of personages who were connected with the CECILS. The mansion and its contents have a character which is rare. In other stately homes can be found treasures which have been acquired by purchase in England or abroad; and become memorials of travel or of the taste of individual members of the family. But at Hatfield there was seemingly an indifference to objects which the world sought after. All that is to be seen is suggestive of one family and their importance in the State. The house is their own memorial. In one sense it is isolated, and there is some excuse for a scion of the house if by "the magic force of habit" he should consider himself a being apart from the majority of men. There are older families than the CECILS, and some of them have rendered many more services to England, but they are less anxious about the impressions of dignity which are made on their relatives or on strangers. All that is displayed is besides reminiscent of royal favour, and living amidst such surroundings can any one wonder the late owner conscientiously concluded that "dishonesty is involved in following public opinion"?

ONE-SIDED RECIPROCITY.

THE title of this article has a contradiction in terms, and is therefore absurd. But it serves to indicate an economic anomaly which many people are eager to preserve. In other words, there is now a desire that England should be self-sacrificing to an extreme extent in order that other countries can prosper. What we propose to say relates to the subject of foreign imports, which has a particular interest for everyone who is engaged in construction.

When JOHN RUSKIN made his first descent among the mysteries of political economy he displayed his fitness for dealing with the science by recommending the abolition of Custom-houses throughout the world. That might appear an extraordinary suggestion to come from a young man whose thoughts were believed to be engrossed by pictures. But everyone acquainted with the literature of the science is aware that vastness is its characteristic. Its votaries claim that political economy resembles mathematics in being based upon axioms that are indisputable, unchangeable and universally applicable. They are supposed to be irrespective of time or place. Free Trade was assumed to be an English discovery especially opportune in the conditions of this country. RUSKIN took a broader and more scientific view by proposing to make it universal. His formula, like many others, may have been only an affair of words. Although he was the son of a wine merchant, it is doubtful whether he was able to realise the whole extent of his proposal.

If JOHN RUSKIN had recommended the abolition, not merely of import duties, but of dues of all varieties, whether called as taxes or under other names, the necessity for Custom-houses might then become more evident. For what are import duties? If we conclude from what is said in ordinary conversation and what often appears in journals, people evidently imagine that they resemble the passenger fees imposed on strangers when they arrive in certain

foreign countries. Import duties, on the contrary, being derived from goods, are paid in the first instance by the owners, but have to be repaid eventually by those who use or enjoy the goods. They are consequently additions to the ordinary taxation of the country receiving them. An Englishman who purchases tobacco, tea, spirits, &c., from which the Custom-house officers have received the stipulated amounts, and which are insignificant if compared with the value of goods admitted as if they were native products, is practically increasing the amount of his own income tax and local rates. The extra sum he pays is, however, for the benefit of a foreign manufacturer. The remarkable spectacle is every day presented that foreigners can dwell at home in ease on the large revenues which they derive from England without in any way contributing to the financial support of this country. We are in truth saddled with a race of absentees, and they form collectively an incubus which can be with difficulty sustained.

It is hardly necessary to say that political economy provides a plausible explanation for the burthen by which it appears to be a blessing in disguise. We have had, however, a long experience in this country of what absenteeism involves and costs. The millions of money expended and the still larger number about to be expended on attempts to allay Irish discontent and to relieve Irish misery are simply the price which has had to be paid for the evil of absenteeism. If Irish landlords performed their duty and lived among their tenantry, setting them an example of industry and endeavouring to promote the common welfare, Ireland need not be more expensive to the Exchequer than England. But the political economists not only condoned the evil, but argued that when a landlord passed all his life on the Continent he was doing more good than if he had remained at home. In fact, no injury, it was asserted, could arise if he expended his whole fortune among foreigners. The rents he derived from wretched Irish tenants were said to represent foreign trade to the same amount, and the more he carried off the more was received from abroad by his tenants in return. The demonstrations were occasionally varied by figurative descriptions of how the sun drew water from the earth in one country, which was carried in clouds through the upper regions, and fell somewhere in the form of rain. The debit and credit sides of the process were assumed to be balanced with that accuracy which belongs to nature. When our trivial affairs are regarded abstractedly, they assume an appearance of evenness. From a remote point of view the earth's surface, with its mountains and valleys, may seem to form a smooth globe. But ordinary people who have to look at things more closely cannot reach those lofty elevations from which things lose their true character.

Political economy resembles algebra. Equations, we all know, can be developed and resolved with the utmost exactitude. But when we apply them to concrete substances we discover that we must make allowances which experience dictates. The political economist in the same way has his formulae, but does not always realise their abstract nature. If a man fail to find employment in his usual avocation, he is told he is at liberty to take up another. That is true to some extent, for there are organisations which may interpose obstacles. It is not, however, perceived that competency in a different calling is of slow attainment and may even be unattainable. The Germans, for instance, allow contractors to employ prisoners. But they stipulate that the prisoners must first be trained by the contractor at his expense, although by the time a man is qualified the term of the sentence may have expired, and his teacher has no claim on his services. That is the difference between theory and practice, but English professors say the Germans know nothing of true political economy. In the same way a workman is supposed by the economist to be able to go from one place to another, however long may be the journey, in search of employment. The economist does not trouble himself about questions of distance, or whether the labourer can dispense with food during his peregrinations. English political economy abounds in similar supra-mundane peculiarities. Through its conclusions the Custom-house has practically ceased to be a toll-house. RUSKIN expressed the desire that other countries would demolish theirs. But they are too wise and we stand alone in our disinterestedness. However

ridiculous it may seem, the reciprocity which was expected to extend through all civilised countries continues to be one-sided.

At the present time economists are busy in discovering reasons to prevent any effort to remedy a state of affairs which is fast becoming disastrous to this country. They can state with truth that the opening of English ports to foreign corn was an unquestionable advantage to the country. That result was, however, mainly owing to an extraordinary visitation rather than to any discovery of the economists. The famine in Ireland, through which myriads died, excited alarm in England, and it was considered wise to secure an excess of food supplies. It cannot, however, be denied that one effect of providing against a contingency which did not arise was to disturb the industrial character of the country. Agriculture declined, and a vast number of people sought occupation in other ways in spite of their unfitness. It is now impossible to restore the old condition of the country. We have to depend on other parts of the world for bread. If the duty of a shilling a quarter on corn, which was abolished in 1870, has to be reimposed, it will not cause much self-denial to the humblest labourer.

There are other things which must be looked on in the same way. Owing to neglect and mismanagement, as well as dependence on foreigners, the supply of native timber is insufficient. Indeed, all materials required in manufactures should be treated with leniency by every Chancellor of the Exchequer. Happily we possess sources of supply for many things which we should consider as corresponding with those found within English boundaries, although hitherto they have not been sufficiently recognised. The necessity for a revision of our economic relations with other countries ought to have been investigated several years ago. But it gains new urgency from the responsibility imposed on Englishmen to satisfy the legitimate claims of the Colonies. At one time in France there was a common cry, *Périssent les colonies plutôt qu'un principe*. But in those days the French, as a home-keeping race, could not realise the importance of property at a distance. At a later time they were better informed, and after the war of 1870. Cochin-China was offered to BISMARCK as a part of the price for peace. England has proved too often the advantages of those separated parts of the Empire. What is more, we can be assured that such powers as France, Germany and the United States would gladly assume all the responsibilities of satisfying the colonists in the demands which they have made to us. To political economists, who consider the highest duty of a man is to buy in the cheapest market and to sell in the dearest, the Colonies are like an investment yielding only a very low return. Empire to them means bankruptcy. But such conclusions are inevitable so long as the science is allowed to assume an authority for which it is not adapted.

To the economist a man is no more than an animal that exchanges, and barter is consequently the be-all and end-all of his existence. To gain the upper hand is supposed to be the only satisfaction in life, and in order to attain it honour and truth are too often sacrificed without compunction. Man, however, is to be considered not merely as a covetous individual complete in himself, but as a part, even if unworthy, of a great whole. He has, or should have, a country, and be willing to pay for his privilege. In an economical sense, it is true, the most successful people on the earth is the race which has been described as *les Sans-patrie*. It is the fact, however, that they also have a country in view, or at least many among them believe they will enter into possession of their old inheritance, and in that way are no exceptions to ordinary mortals. England, which yields profits for foreign producers who seldom or never visit it, is no doubt an ideal land for followers of the new finance. But it will never uphold the old reputation for being foremost in everything that is worthiest of man if it should make over its manufactures to alien trusts. It was that England which gained the Colonies, and which, we hope, will never allow them to come under a different sway. If rightly considered as an element in sociology, political economy can render service like any other science, but if permitted to continue as supreme arbiter it can only lead to danger.

Free Trade, as we have shown, was due to an emergency, and it was stimulated by a desire then strong for universal

peace. The two were considered as synonymous, and the great advocates of the repeal of the Corn Laws usually intermingled the two in their orations. But after sixty years how few countries have responded to the English appeal or have had the hardihood to imitate the English example. To do so would be to disregard the experience of countless generations. Every country has insisted on its special privileges. The word "sycophant" remains as evidence of the resolution of the Athenians, who were enlightened as well as temperate, to keep their figs for their own enjoyment, and to reward the informers who discovered the criminals who exported them among strangers. Even if the story is doubtful, it is at least evidence of an ancient belief that individual gain is sometimes to be sacrificed to the needs of the majority. There is no jealousy of the kind in England. But those with whom we trade heavily mulct whatever is offered to them. Indeed, none of our customers can imagine, unless very imperfectly, that Free Trade means fair trade on mutual conditions. The French merchant who was consulted by COLBERT about the means of advancing French trade replied *Laissez faire, laissez passer*. He would now say the liberty was not to be extended to both parties in the transaction, for one at least ought to be handicapped. That is the position in England at the present time. It is only necessary for a visitor to purchase English goods of any sort in a foreign town to discover the signification of *laissez faire* in financial sense, and if he will purchase foreign goods of similar kind in England he will ascertain how different the same idea may appear to people in various countries. Indeed, in England it is possible to obtain goods at a much cheaper rate than they are sold for in the neighbourhood of their production.

Everyday experience confirms what was stated by Mr. DEACON, C.E., in a letter which appeared in our Supplement of last week. Speaking of the importations of iron and steel from foreign countries he said, "This country is used as the dumping ground for their surplus production at prices under cost for the purpose of reducing their cost to a low figure, in order that they may make a profit in their home markets." It is indeed difficult to believe that the prices are evidence of honest trading; but in the pursuit of cheapness not only individuals, but public bodies (in municipal trading and foreign imports are inseparable), are regardless of the manner in which foreign goods are produced, and thus we find all over the country many examples which are not the result of a more satisfactory system of working, and are valueless as incitements to our own manufacturers.

It will be objected that we are one-sided in our remarks. But they are borne out by the statements of those who have visited manufacturing countries in the country reputed to be our strongest rivals. Take the case of the United States as exhibited in the reports of the Missouri Industrial Commission. We have already described the remarks of the members more immediately connected with building. They were not calculated to make Englishmen lament over their own degeneration. Coarseness and scamping were allowed to prevail in construction which no English architect would tolerate. In other trades a corresponding weakness was noticed. The work in the boiler-shops and shipyards is declared to be of not so good a quality as was done in England. The locomotives are said to be generally of an inferior character and extremely ugly. In the structural ironwork such as bridges we read, "Let everything else in that country, utility of the moment seems to be the watchword, making the country as a whole seem like a country of temporary expedients." There is much else to the same effect, and they reveal that when American works are examined by workmen's microscopes they do not possess that wonderful perfection ascribed to them in England. But there is one lesson which can be drawn from the reports, and it is thus expressed:—"Probe the American iron and steel industry sufficiently deep, and it reveals the fact that in spite of unlimited supplies of raw materials, cheap transit, latest improvements in machinery, and enormous concentrations of capital, the wealthiest manufacturers strenuously assert the continued necessity of prohibitive tariffs as the only means of maintaining and securing their home trade against outside competition." But the iron and steel industry is not the only one indebted

to Protection. We may therefore ask, If the English race at one side of the Atlantic is not afraid to adapt its policy to the circumstances of the time, why it should on the other side be considered fatal to prosperity to adopt a similar policy? The political economist may perhaps be able to devise a formula which will sanctify an alteration.

It may be gratifying to our vanity to stand alone in upholding a policy of Free Trade. We must also remember that the principle and practice have got such a hold on this country, a vast number of Englishmen have found it more profitable to become the agents of foreigners rather than independent producers. They will naturally uphold the theorists. It is not, however, to be expected that such a change as is desirable can be accomplished without causing inconvenience. But the common sense of the people must in the end realise that the present system of sacrificing our own interests to those of our rivals is ridiculous. Originally political economy was not held to be a science so infallible as never to need alteration. One of the earliest of its pioneers was DAVID HUME. His advocacy of foreign trade was carried to excess, but "nicely calculated less or more" in gain did not appear to him as the *summum bonum*. Accordingly he said, "A government has great reason to preserve with care its people and its manufactures. Its money it may safely trust to the course of human affairs without fear or jealousy. Or if it ever give attention to this latter circumstance, it ought only to be so far as it affects the former." A little of that preserving is all that is sought. Let it supersede approval of the one-sided reciprocity which threatens to become fatal not only to English manufactures, but to the English people, by a policy which is demanded by the exigencies of the present, if not of future times.

THE TOWN WALL OF STIRLING.

AT a meeting of the Stirling Town Council on the 17th inst., a memorial was submitted from the Stirling Natural History and Archæological Society against a proposal made by the burgh committee of the Town Council to sell part of the old town wall to certain private individuals in order to give a frontage to new buildings. The following is the text of the memorial:—

1. The town of Stirling is one of the few walled towns in Scotland, and nowhere else can there be seen so impressive an example of the enclosure of a town for the purpose of protection. The old records of the burgh show that in the year 1547 the town walls were rebuilt and strengthened in order to afford the young Queen Mary a safer place of residence than the capital of the kingdom, and at a later period of national alarm your predecessors showed their public spirit by devoting to the same patriotic purpose a great part of the revenue derived from pious gifts to the pre-Reformation church. While it is not asserted that any particular part of the structure still standing is the original town wall (because there were frequent reparations in former times) it is claimed that the remains are sufficiently old to show the ancient method of fortifying a Scottish burgh, and from an historical point of view are well worthy of being carefully guarded. The spirit of modern enlightened legislation, as evidenced by the Ancient Monuments Protection Acts of 1882 and 1900, is rather to preserve as much as possible such relics of the past than to destroy what can never be restored. Dividing as it does the old town from the new, and crowning the ridge on the south side of the rock of Stirling, the town wall is an ancient landmark which never fails to attract the attention and excite the admiration of visitors. It is believed the removal of the lower part of the wall and the modernising of its surroundings would detract from the interest of the locality, which your honourable body has been lately considering how best to advertise for the information of strangers. Along with its central situation and unrivalled scenery, it is the relic of bygone days in Stirling, and its historical associations, which attract the best class of residents, and also make it a popular resort for tourists, to the great advantage of its merchants and tradesmen. Any further interference with the town wall, one of the chief evidences of the antiquity of the burgh, would, it is believed, rather tend to injure than promote its commercial interests.

2. It is impossible to separate the question of the town wall from another question of public importance, namely, the preservation of the Back Walk, which is justly regarded as one of the most beautiful and picturesque features of Stirling. If any part of this favourite walk be allowed to be made a street for cart traffic, there is a danger that in the course of time the wall of it may be lost to the inhabitants as a pleasure walk, which would be disastrous alike to the amenity and prosperity

of the town. The site of the public library was specially selected on account of the quiet and retired character of the locality, but the proposal now before the Council would eventually place it in the centre of a noisy thoroughfare.

3. In the year 1878, when a similar proposal to the one now made was brought forward by the late Provost Christie, it excited the strongest indignation in the community, who felt that the precious privilege and boon which they enjoy in the Back Walk, sheltered by its old historic wall, was being sacrificed for the convenience and profit of a few proprietors. There can be little doubt that this feeling still exists, and if it had been supposed that the burgh committee were really serious in their proposal, or that such an encroachment on the public rights would be tolerated by the present Town Council, it would have found as strong expression as it did twenty-five years ago.

Your memorialists earnestly trust that the Corporation of this ancient and Royal burgh will strenuously oppose all attempts to destroy any part of the town wall or Back Walk, and will rather maintain and cherish features of the town which have been so highly prized in the past, and are so well calculated to afford instruction and enjoyment to the present and future generations.

Ex-Bailie Gourlay, convener of the burgh committee, asked that the matter be remitted back for further consideration.

Bailie Watt: Is there the slightest danger of this vandalism being committed?

Ex-Bailie Gourlay: I have no hesitation in saying there would be no vandalism although the wall was wiped out.

Treasurer Buchanan having indicated his desire to move an amendment, Provost Thomson said the feeling appeared to be against the continuance of a discussion on a subject that sought to destroy a prominent feature of the town, and he thought the convener and his committee would be well advised if they did not seriously attempt to bring before the Town Council again any minute which would propose the destruction or removal of any portion of the town wall. After further discussion, the matter was remitted to the committee for further consideration, the Provost remarking that it would give the majority who were in favour of the proposal an opportunity of repentance.

A communication was also submitted from the Glasgow Stirlingshire and Sons of the Rock Society containing the following excerpt minute of a meeting of directors held on August 13:—At a meeting of the directors of this Society held to-day, the proposal to take down the part of the old Stirling town wall to the east of the new public library was under consideration. It was unanimously resolved to make a strong representation to the Town Council against the destruction of any part of such an ancient and interesting historic relic and landmark, and the secretary was instructed to write the town clerk to that effect, and to express the extreme regret that would be felt by the members of this Society should the proposal be carried into effect.—ARTHUR FORBES, secretary."

The following letter from the hon. secretary of the Glasgow Archæological Society was also read:—

"88 West Regent Street, Glasgow:

August 13, 1903.

"Dear Sir,—I regret to hear that it is proposed to obtain powers to pull down the portion of the old historic town wall of Stirling, extending from the new public library to Wolf Craig. This Society cannot of course know the reasons which may be urged for this step, but it has more than once offered respectful remonstrance against any destruction of valued relics of the past which can never be replaced. One of the glories of Stirling is the preservation of its historical buildings, and it is sincerely to be hoped that the Town Council will take no step which may imperil any of them.—Yours sincerely, WILLIAM GEORGE BLACK, hon. secretary.—The Town Clerk, Stirling."

HASTINGS CASTLE.*

THE Castle of Hastings (Haestinga-Cæster of the Anglo-Saxons) is situated upon the remains of a natural plateau which surmounts the termination of a spur running southwards from the mainland to the seashore. On either side of this spur is a valley, the eastern one forming the bed of an ancient harbour, called by the Anglo-Saxons Haestinga-Port, and by the Normans one of the chief of the Cinque Ports. There is evidence that this harbour and the castle plateau extended further southward, on land now overflowed by the sea, and there also probably was the old town of Hastings. The castle plateau was occupied in prehistoric days by a Neolithic settlement. Remains from this settlement are to be seen in the Hastings Museum. No Roman remains have been discovered, and beyond the fact that there was a Cæster at Hastings in

* A paper read by Mr. Charles Dawson, F.S.A., F.G.S., at the visit of Le Souvenir Normand on the 21st inst.

Anglo-Saxon times, which possessed a mint, one cannot point definitely to any of the earthworks now to be seen as attributable to the Anglo-Saxon. In the autumn of 1066 King Harold probably dismantled any existing fortification before proceeding northward against Tostig, leaving the south coast wholly unprotected.

William, Duke of Normandy, landed opposite the castle of Pevensey on Friday, September 28, 1066 (the eve of St. Michael's Mass). Pevensey at that time stood upon an island surrounded by the sea and salt marshes. William proceeded to reconnoitre the land, probably in the direction of Hooe, in the neighbourhood of Hastings, and decided to remove to Hastings as a better base for his subsequent operations. His army probably marched past Standard Hill towards Hastings, and it was perhaps at this hill that his standard was unfurled first on the mainland of England.

Duke William entered Hastings on the day of St. Michael, the patron saint of Normandy, and this fact is probably commemorated by the design on the town seal, which bears the representation of St. Michael slaying the dragon, and the motto which surrounds it, "Cruel dragon, thee the power of Michael shall conquer." The dragon on this occasion was the dragon standard of Wessex, under which Harold fought the battle of Hastings. The reverse side of the seal probably depicts an exploit of the Hastings Cinque Ports squadron under Hubert de Burgh off Dover in the year 1217.

The Bayeux tapestry depicts many incidents of this visit, among others either the building or the restoration of a castellum at Haestinga-Ceaster. This probably surmounted the existing mound at Hastings Castle, and the fosse which surrounds it and intersects the plateau is probably the particular ditch that William ordered to be dug there. William's ships were berthed in the harbour at Hastings, and it was there, while the Duke was inspecting his ships, that Hugh Margot, a monk of Fécamp, came to him on an embassy from Harold. The town at this time was probably burnt and ravaged, and it was not until after the Conquest that the new town of Hastings sprang up alongside of the Norman fortress in the valley of the Bourne.

This town is known in the records as "Nova Hastings." William's camp at Hastings was admirably situated as a base of operations. The district around it is enclosed by a range of hills extending from Fairlight to Heathland (Telham Hill), near Battle, and from Battle to Boreham Bridge, near Standard Hill, and by the marshes of Pevensey. In the days when, in Sussex, the tops of the hill-ranges and rivers were the principal highways, it was important to hold possession of them. The range of hills enclosing the district of Hastings is broken only at one spot—at Battle. This probably Harold knew, since his Manor of Crowhurst was situated there, and he therefore seized upon this pass in the hill-range and occupied a plateau behind it. This move destroyed William's northern line of communications between Hastings and Pevensey. Harold's way to Hastings was, however, barred by the Norman outposts at Heathland, and it was to this hill that William brought up his troops from Hastings.

After the battle William came back victorious to Hastings, and directed that the body of Harold should be buried upon the hills at his camp by the sea. Harold was there buried beneath a heap of stones by William Malet, with an epitaph commanding his body to lie there by order of the duke and his spirit to watch over the sea and shore, as he did while living. William remained five days at Hastings after the battle, hoping to receive the submission of the kingdom. He then marched towards Dover by way of Romney, leaving a garrison at Hastings under the command of Humphrey of Tilleul, who, indeed, had had charge of the castle since it first began to rise, and whose figure is probably that shown in the Bayeux tapestry as directing the operations of the workmen.

Upon the division of the English lands by the Conqueror, Hastings and a tract of land surrounding it, called its "Rape," was given to Robert, Count of Eu, who was also castellan of the fortress. He founded within its walls the collegiate church of the Blessed Virgin Mary, which he endowed with seven prebends, held by secular canons under a dean. One of the early deans of the church was Thomas à Becket, and later on Walter Langton, Bishop of Coventry and Chancellor to Edward III. One of the prebendaries was the famous William of Wykeham. The Castle underwent many vicissitudes. It was strengthened, and a keep (Tur) built by Henry II. King John, in his flight from Prince Louis the Dauphin in 1216, destroyed the Castle, probably by fire, since traces of a conflagration remain. It was restored by Henry III. about the year 1225, but fell into decay during the fourteenth and fifteenth centuries, chiefly owing to the depredations of the sea, and to the fact that the moneys contributed towards the Castle guard were misapplied.

The Castle and Rape were successively held by the Counts of Eu, the Dukes of Brittany, the Earl of Westmoreland, the Pelham family, the Hoo family, and the latter granted it back to the Pelham family, in whose hands the Castle still remains.

The collegiate church and its prebends were dissolved at the Reformation in the time of Henry VIII. (1545). The Count of Eu used Hastings as a place of embarkation, and the provision of a ship for the lord's use in transit was made his subject of knight service of one of the tenants of the Rape. Among the historical events connected with the Castle I mention the embarkation there of William II. on his invasion of Normandy in 1094. It was on that occasion that the bishop (Anselm of Bec) rebuked the king on the immorality of his court, which Eadmer, his secretary, has so vividly described. It was here also that King John passed certain maritime laws and ordained the sovereignty of the English flag over the high seas; an ordinance which lost much of its glamour by John's subsequent flight and destruction of the Castle. King Edward I. also passed some maritime laws at Hastings. The military history of the Castle closes at a comparatively early date, but the collegiate church (or Royal Chapel, as Edward I. chose to call it) had many interesting vicissitudes, and the records throw a very interesting sidelight on the ecclesiastical history of the period extending between its foundation and its dissolution.

Architecturally the castle consists of an inner and an outer ward, the former being walled and the latter consisting of earthworks only. The inner ward contains a mound in its north-western angle, and upon this probably stood its original wooden keep. An interesting subterranean dungeon of Norman date is to be seen in this mound. There were several lines of trenches, those on the west side being now entirely destroyed. The more massive walls of the Castle are attributed to the building of Henry II.'s time, and most of the thick walls, including those on the east side, belong to the reign of Henry III. A large portion of the Castle, including the eastern wall, built by Henry II. (probably of rectangular form), has been destroyed by the sea, which formerly undermined the cliff on the south side, which has fallen down and has been washed away. The chapel within the Castle probably contained the oldest Norman masonry, but it seems also to have been improved by King John, and most of the best work now remaining is of Henry III.'s time. It consisted of a nave and cloister on the south side, a choir and chancel. There was one central tower with a spire above the choir, and two western towers, each of which may be seen. The dean's and canon's lodgings were mostly situated on the western side of the chapel. The records of the secular canons who served the church were not distinguished for their morals "corrupting the neighbouring flock," as the records say, and this subject led to frequent disagreements between the Bishops of Chichester and the Kings of England, each claiming jurisdiction over the vicars.

STONEHENGE.

A LETTER has been sent by Mr. G. Shaw-Lefevre, a member of the Commons and Footpaths Preservation Society, to Lord Edmond Fitzmaurice, M.P., chairman of the Wilts County Council, relating to the rights of the public in respect of Stonehenge. He writes:—

August 1.
Dear Fitzmaurice,—I learn from the reports in the papers that the Wilts County Council, of which you are a member, at its meeting last week arrived at two decisions regarding Stonehenge:—(1) It declined to accede to the petition of the Commons and Footpaths Preservation Society for a contribution to the costs of legal proceedings to be taken by them for vindicating the right of public access to the monument, by well-defined and long-used carriage ways of charge, and for removing the fences which have been erected across these roads, and which so cruelly disfigure Stonehenge; (2) it agreed to forward to the Government, apparently without comment or approval as to terms, the resolution made to you as chairman of the council by the owner of the land on which the monument stands to sell his interest in and eight acres of land for the sum of 50,000*l*.

With respect to (1), I may remind you that the application was made by the Society many months ago and under the impression that there would be difficulty in obtaining it from the county council or the general public full pecuniary support for the necessary legal proceedings. Later, however, when the county council a few weeks ago decided not to undertake these proceedings, on the ground, mainly, that the cost of them ought to be borne by the general public rather than by the district council, on whom they would fall if litigation were set in motion by the county council, the Society decided to make an appeal to the public for the whole of the necessary funds. This appeal met with such general support, that the great public interest taken in the question, that the public found themselves in a position to undertake whatever was necessary for determining the question of right, and that accordingly instructed their solicitors to commence proceedings without further delay (of which there has been too much in the past) the necessary legal proceedings.

As, however, it is not likely that any material progress will be made in such proceedings until after the Long Vacation, there will be ample time afforded for negotiation between the Government, yourself and the landowner concerned for the transfer of the interest of the latter in the monument. This will be a solution eminently satisfactory to the Society, relieving them from an invidious task, provided it is clearly understood that the fence which so disfigures the monument will be removed and that the terms of purchase are reasonable.

The Society thinks it necessary to make these reservations, for it has been suggested in some quarters that the fence should be maintained even after purchase of the monument by a public authority. They feel strongly that the existing fence should be removed in any case, whatever other means of protection may hereafter be deemed advisable.

They are also of opinion, in view of the great importance of the legal issues involved in this case, and the bearing which a decision on them may have on many cases of the same kind in other parts of the country, that unless the terms of purchase are much more reasonable than those now offered, it would be more to the interest of the public that the question of the right of access to the monument should be determined in the first instance.

ANCIENT ATHENS.

THE most considerable division of Attica, called the Pedion, was an oval valley belonging to the town of Athens; its whole extent did not exceed nine miles in length and six in breadth, according to the calculation of modern travellers. This soil, watered by the Cephissus, the Ilissus and the Eridan, was well adapted for the culture of olives. Vast forests of such trees, when in bloom, appeared like a white veil sustained by branches of a dusky green, and numberless birds of various kinds took shelter there as they returned in spring out of Asia. The possessors of those great plantations were the richest and perhaps the most refined among the Athenians, for such celebrated men as Socrates, Sophocles, Thucydides, Plato and Epicurus were all natives of the different villages around Athens. This district was divided equally by ten great roads, which, like the radii of a circle, tended towards a common centre until they reached the capital. On entering the city, says Dicaearchus, no person would imagine himself at Athens; the streets, he adds, are strikingly irregular, the town in general

badly provided with water, and although some houses appear more convenient than others, yet all of them are wretched. Only when arrived at the theatre, continues he, and on discovering the grand Temple of Minerva, that incertitude begins to vanish, which was produced by the excessive disproportion between the real state of things and the splendour of their reputation. The enlightened and impartial Greek who makes this acknowledgment was the disciple of Aristotle, and wrote some years after the death of Alexander. His testimony should remove, therefore, the prejudices of those pretenders to learning who still imagine seriously that no town in the universe ever equalled Athens in beauty. The constitution of a popular government opposed invincible obstacles to the pomp of the Athenians by preventing them from raising palaces in the capital. During the prosperous days of the Republic, says Demosthenes, the houses of Themistocles and Aristides, undistinguished by the smallest appearance of superiority, bore a perfect resemblance to those of their neighbours. The nobility and chose to domineer in some solitary spot or in the smallest village rather than be confounded with what they called an imperious populace, whose glory consisted in repressing all other pride but its own. It is further necessary to observe that the most ancient cities of Greece, such as Thebes, Sparta, Argos and Athens were built almost at random. In proportion as their population increased new quarters were constructed, but the ancient edifices would neither admit of order nor symmetry. On this account the towns of the Greek colonies, both in Europe and Asia, possessed infinitely more regularity; the ground was there allotted at pleasure, the public places were marked out with taste, and the streets either ran parallel or crossed each other at right angles. This really was the case at Thurium, a town in Italy founded on the ruins of the ancient Sybarez, and a plan of that remarkable place has been transmitted to us by Diodorus Siculus.

The Selected Designs submitted in a limited competition recently held for the Baptist schools, Luton, comprise a large hall with galleries around, fifteen classrooms, church parlour, infants' room, cloakrooms, &c., and the usual conveniences. The whole of the rooms will be electrically ventilated. The estimated cost is about 4,600*l*. The authors of the selected design are Messrs. George Baines & R. Palmer Baines, London.

NOTES AND COMMENTS.

NEAR the north-eastern boundary of Derbyshire, and close to the railway station at Hope, exploration on a small scale is now being conducted on behalf of the Derbyshire Archæological Society by Mr. JOHN GARSTANG, of University College, Liverpool. In the village of Brough some buildings are to be seen in which evidently ancient masonry was employed. The stone was supposed to be derived from a castle at Glossop, but there it was only second-hand. Parts of columns, fragments of sculpture and grooved stones could hardly be said to have been produced in Mediæval times. Antiquities on a smaller scale were turned up from time to time. It was therefore decided to try experiments in excavation. On the first day labour was rewarded by encountering the foundation walls of a Roman stronghold, which in places were only some 8 or 10 inches below the surface. Both inner and outer walls were afterwards laid bare. They vary in thickness from 3 to 5 feet, and are of grit-stone. Evidently a fort or castle, as distinguished from a camp, stood there, and it is not impossible a Roman station. What is supposed to be the prætorium in the centre has been discovered, and the four gates or openings are clearly visible. The work is being done on systematic lines. Numerous fragments of tiles, bricks and broken pottery, some evidently being portions of urns of baked clay, have been unearthed. The latest discovery is a bath.

THE Cambrian Archæological Association is not wealthy, for an addition of fifty two members in a year and a balance of 282*l.* in bank are considered as highly noteworthy advantages. But the Association is doing excellent work under economical conditions. For example, it was decided at the annual meeting to vote 30*l.* towards the excavation of Treceiri Fortress. Outside Wales that name is likely to be unknown. The defence stands on the summit of Eifi mountain in the Llyn promontory. It is assumed to date from the first or second century of our era, the relics found being of the late Bronze Age. The fortress is in a remarkable state of preservation. The outer wall is fairly compact, and the inner wall is in an almost perfect state, and has remains of a rampart 10 feet high, while within the enclosure, which embraces about $5\frac{1}{2}$ acres, there are about 140 cutiau or huts. Thirty of the huts have been excavated, and there have been brought to light two bronzes and two Egyptian porcelain beads, which it is presumed were brought over by traders, British and Roman pottery, iron knives, sling stones and spindle horns. Outside the two entrances to the fortress are elaborate works of defence, and there is one sally-port which has a stone lintel, the only known example in Wales. The exploration has been conducted under the direction of Mr. ROBERT BURNARD, Mr. BARING-GOULD and Mr. HAROLD HUGHES. As yet the work can be regarded as only partly accomplished.

THE Palazzo di Venezia in Rome, which stands at the end of the Corso, is unlike most buildings of its class, for it recalls the Mediæval castles of Italy. It was designed by GUILIANO DA MAJANO, and therefore dates from the middle of the fifteenth century. The stones employed in its construction are thought to have been derived from the Coliseum. The palace owes its origin to Pope PAUL II., who was elected in 1464. He was a Venetian, and he endeavoured to unite all Italy against the Turks then threatening Europe. It was used as a summer abode by some of his successors. The Duke of FERRARA, BORZO D'ESTE, lived in it and acknowledged himself to be a feudatory of the Pope. It also served as a palace of CHARLES VIII. of France for a short time. PIUS IV., who presided at the second meetings of the Council of Trent, presented it to the Venetian Republic in order that it might serve as a residence for their envoy and as a reward for being the first State to accept the decrees of the Council. On the downfall of the Republic the building fell into a state of decay. Then it passed into the possession of Austria and was restored. But it cannot be said at the present time that the building is complete. A part, the palazzetto, if not the whole of the large building, is likely to

be removed in order to provide ample space for the memorial of VICTOR EMANUEL, which would lose much of its effect if buildings came too near it. There is consequently one of those coincidences which occur in history. The building was erected by one Venetian patriarch, and it is doomed to fall during the Papacy of another.

UNTIL a few years ago the wall-papers produced in Great Britain were in demand by the Germans. They were preferred on account of their superior and enduring qualities to French papers. But the trade, like many others, has been declining in Germany. British papers are less admired, and unless strong efforts are made the German market will be lost. What is more important, German papers are finding their way to other countries. During five years the quantity exported has increased by 83 per cent. The imports have fallen. No doubt the papers mostly exported are of a cheaper kind, while those imported include the more expensive makes. However, the German industry has also greatly improved in the manufacture of the latter; the British manufacturers would do well to pay greater attention to the patterns here in favour. The days when the so-called "British style" was the fashion, more especially for bedrooms, are over; the fashion materially assisted the introduction and development of the recent German style called "Jugend style," though it is not likely that it will last long, for its exaggerations have a tiring effect; it has, however, given many German industries (wall-paper, hangings, furniture, &c.) a new impetus, which must prove detrimental to foreign competitors. Whether under the new arrangements by which competition is diminished the character of English papers will be upheld may be doubted.

A PARLIAMENTARY return has appeared showing the expenditure on technical education in England and Wales for the year 1901-2. The amount is large, and it is hoped the skill acquired by the students will correspond with the outlay. The total is 1,057,399*l.* 0*s.* 2*d.*, of which sum 1,008,947*l.* 14*s.* 3*d.* was expended in England. It is not possible to discover how much was laid out on building, but it is shown by the return that 21,728*l.* 8*s.* 3*d.* was expended under the Public Libraries and Museums Acts and applied to the building or maintenance of science and art schools, art galleries or museums. In the preceding year, 1900-1, the total expenditure in England and Wales was 1,051,422*l.* 0*s.* 9*d.*; the increase is therefore less than 6,000*l.*

HATFIELD HOUSE, HERTS: SOUTH FRONT. DETAIL, SOUTH FRONT.

DESIGN FOR PROPOSED EXTENSION OF HULL TOWN HALL.

THE scheme as suggested by the conditions entails the removal of a portion of the buildings existing on the site, and the internal rearrangement of the portion retained for the council-chamber. The new buildings are planned in two groups, the centre containing public hall, council-chamber and committee-rooms, with entrances in Finsbury Gelder Street and Hanover Square, the west end of the site being occupied by the Law Courts Department. The elevations generally were to be carried out in York Mansfield stone and red brick. The estimated cost of the work was 97,000*l.* Mr. W. ERNEST HAZELL is the architect.

PAIR OF SEMI-DETACHED VILLAS, NORTHWOOD, DETACHED HOUSE, NORTHWOOD.

A SIMPLE treatment has been attempted in the design of a pair of houses in red brick and white rough-cast with overhanging wood cornices and eaves. The builder of the pair of houses was Mr. JOSEPH GREEN, of Northwood, and of the single house Mr. C. EAMES, of Watford. Mr. J. ELGOOD, A.R.I.B.A., was the architect.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE sixtieth annual congress of the British Archæological Association was opened in Sheffield on the 10th inst. The Lord Mayor (Alderman Wycliffe Wilson) formally received the members at the town hall. Mr. R. E. Leader, the president, acknowledged the welcome, and hoped the visit would arrest the busy hurry of Sheffield for a moment, and remind it that it had a past, and that it owed something to those who had gone before. It was rather difficult to get Sheffield to interest itself about antiquity. But Sheffield people had an enthusiastic attachment for their town, and he hoped the visit of the Association would induce some of them to take an interest in its archæology.

The members were then taken to the parish church. Mr. J. R. Wigfull, architect, one of the local hon. secretaries, gave a description of the history of the church. Nothing very definite was known about the early history of the church.

Manor Lodge.

Manor Lodge was next visited. It is a wreck. Well might Mr. Leader, says the *Sheffield Daily Telegraph*, repeat that Sheffield has taken little interest in things that are old. The Manor House was one of its most interesting associations with the history of the country. Mary Queen of Scots was imprisoned there for many a long year, although during most of her confinement she was a sort of prisoner-guest. But the old manor is now in a terrible state. It looks as though there had been a big fire there recently. A chimney-stack stands at one end. In another part the roof is bare, and the falling timbers look much as they would after a fire brigade had been attending to them. The place seems to be open to everybody without much care. The Duke of Norfolk is having some researches made under the direction of Mr. T. Winder, and there is a prospect of the place being looked after more carefully in future. Unfortunately there is little left to care for. The tower outside the walls of the old Manor House has been restored from its farm associations, and now forms the most interesting object of interest. Mr. Winder had prepared a paper on the history of the old house, but he wisely handed round copies so that members could study it at their leisure. In a few words he briefly explained the history of the place. Very little is certain. An alderman of the City Council went so far as to say that the only "fact" that could be stated as a fact about the place was that Wolsey occupied a room which was pointed out in the old house. Mr. Winder said the tower now standing was Mary's prison, and members climbed through the white-wash to her apartments. But there were doubting Thomases in the party. Mr. Winder himself rather encouraged the doubters by admitting that it was strange that Mary should be "imprisoned" outside the walls of the prison. One distinguished archæologist cross-examined the caretaker on the matter. It might be possible to doubt Mr. Winder, but an old man who had looked after the place for years, and knew just as much as he had been told, was readily accepted as undeniable evidence. In the old portion of the ruins was a place pointed out as a possible guard-room. It is now the abode of smells. The general secretary had to use his whistle freely before he could get all the members away from the interesting old ruin. There were so many theories to advance and upset. Then they drove back to the warmer atmosphere of Sheffield for the evening gatherings.

Sheffield's Early Records.

In the evening there was a conversazione at the town hall, on the invitation of the Lord Mayor and Lady Mayoress of Sheffield.

Mr. R. E. Leader, in the course of his presidential address, said during the thirty years that had elapsed since the British Archæological Association honoured Sheffield by holding its annual congress there great changes had taken place. A town of some 250,000 inhabitants had developed into a city of over 400,000. Its central streets had been reconstructed almost beyond recognition. The remorseless extension of its boundaries had been accompanied by a lamentable sacrifice of beautiful surroundings and the submerging of many old landmarks. The immense modern activity, evidenced by this material prosperity, was inimical to a study of archæology, and to the conservation of matters of antiquarian interest. The topography of Sheffield was the key to its history. The slopes that rose from the confluence of Sheaf with Don, buttressed by a rampart of hills and wild moorland, girdled with primeval forests, and remote, on the only accessible side, from the great de of life, formed an ideal place of settlement when might as the only right, when it was desirable not to tempt foes, and essential to be provided with secure lines of defence or retreat if they came.

Little was certain as to the British inhabitants of the district. But general knowledge of the slight impress made on the less vulnerable parts of the country by the centuries of

Roman occupation taught them that the tribe or tribes there escaped conquest. When the Romans departed the long-headed, black-haired people of whom Mr. Addy found traces were left, until in course of time another stubborn resistance had to be offered to bands of invading Germanic tribes. Slowly, painfully, and long years after more open parts of the country had been subjected, the Saxon fixed his hold on Hallamshire, driving to other regions a race which disdained to sink its freedom by commingling with the outlander. So the Saxon erected his dwellings on the slopes between Loxley, Rivelin and Sheaf, and overlooking the broad valley where these became united in the Don. But little was known of the Saxon occupation. Equally in the dark were they about the fortunes of Hallamshire when the Danes overran the land. Their chief ethnological guide there was philology, and the outstanding fact in connection with the place-names and dialect of Hallamshire was their singular freedom from that Scandinavian element which manifested itself in closely-surrounding districts. Dr. Henry Bradley had pointed out that the names included within a circle of twelve miles radius round Sheffield were almost exclusively of Anglo-Saxon origin. Their dialect, too, was a thing apart, showing robust individuality and self-centred independence. The common speech supported, though somewhat less emphatically than place-names, the evidence of pure Saxon descent.

It might reasonably be conjectured that when Dane and Saxon had agreed to live side by side, the people of Hallamshire, again benefiting by their exclusion, enjoyed a fair measure of peace and prosperity. That certainly was their state when the Norman invasion burst upon the land. At that time the township was protected by encompassing stockade and ditch. Outside were the common pastures and the plough lands; the fields apportioned among the husbandmen in those long strips of which their land boundaries retained distinct traces to this day. The Saxo-Danish lord's aula of that period had faded, leaving not a rack behind. Under a line of Norman lords, sagacious enough to conserve the existing order, though grafting on it new forms, the commonalty settled down under a rule that, if sternly arbitrary, was paternal. If it conceded no rights it insured to the obedient tacit privileges. The outward visible mark of the change was the suppression of Hallam, and the emergence of Sheffield as the seat of the lord. The De Lovetots and Furnivals set themselves to remove the reproach of there being no church except at Treton in their domain, and their mildly feudal sway was marked by other religious and charitable foundations. The inhabitants enjoyed the happiness said to be the portion of people "whose annals are blank in history's book." While other towns situated on the great lines of communication won early recognition in the form of charters of incorporation, Sheffield humbly plodded along, content with such crumbs as fell from its lord's table. That its privileges as to common lands, with some voice in regulating the parish pump, were, with a readjustment of taxation, continued from Saxon to Norman rule, was evident. The two local historians who had studied the subject most closely interpreted differently the status of the community as revealed in Lord Furnival's charter of 1297.

From 1297, the date of Thomas de Furnival's charter, to 1557, when Queen Mary, alienating public property to ecclesiastical uses, had incorporated the church burgesses, Sheffield municipal history was largely matter of conjecture. Not until 1556 did the accounts of the Burgery or Town Trust commence. Not until 1625 had they systematic records of that Cutlers' Company which, under King James's Charter, supplanted a craft guild of less formality. This mention of the Cutlers' Company led him to remark that great as had been the influences of topography on Sheffield's general history, they might be said to have created, as they had also vitally shaped, her industrial career.

Five rivers, like the fingers of a hand

Flung from black mountains, mingle, and are one.

It was these, together with abundant iron and contiguous forests, supplying unlimited charcoal for smelting, that fixed the occupation of the earlier settlers, and made them workers in iron. At what period they began to shape the iron into weapons and tools was just one of the problems awaiting illumination. The first known mention of Sheffield cutlery was dated 1340. In the list of goods issued from the King's wardrobe in the Tower (fourteenth year of Edward III.), there was scheduled, amongst other knives, "i. cultellum de Shesfeld." Next came Chaucer's oft-quoted reference, in the Reeve's tale, to the "Sheffield thwytel," which the Miller of Trumpington "bare in his hose." That was always cited as proof that Sheffield cutlery had already obtained national fame. But no one had ever explained by what process the name of Sheffield had become applied as a trade description to knives when Chaucer wrote. The Canterbury Tales were approximately contemporaneous with the Poll Tax of Richard II., 1379. That document's revelation of the humble character of the population there emphasised the dis-

abilities incident upon Sheffield's geographical position; but the remarkable thing they had to note for the moment was that among all the townfolk assessed, and among all the trades specified, not a single cutler was named. The nearest approach was one Johanne Coteler, assessed at the minimum sum of a groat. Yet they found cutlers (and prosperous ones, too) in the neighbouring Hallamshire villages of Ecclesfield, Handsworth and Tinsley. How, then, were Sheffield knives familiar to Chaucer?

The part played by Sheffield in the events of national history had been but small. The clash of arms had only twice been heard within its borders. As an obscure episode in the wars of the Barons, De Furnival's castle (if, indeed, it were a castle) was burnt in 1266. There was no doubt of the reality of the castle, which in 1644 was besieged by, and surrendered to, the Parliamentary forces. These two events, so far from impugning his demonstrations of the teachings of the seclusion of Sheffield, strengthened it distinctly, because the castle, not the town, was in both cases the object of the attack. Archæologically, they regretted its demolition, but undoubtedly the Commonwealth, in razing the castle in 1648, was wise in removing what was useless in the keeping of friends, and could not be more than an irritating thorn in the hands of foes.

The imprisonment in Sheffield, for some fourteen years, of Mary, Queen of Scots, was the only other notable point at which Sheffield touched the nation's history. Here again recurred the old note, for undoubtedly Lord Shrewsbury's fortalice was chosen, and remained much longer than any other place Mary's prison, because of the seclusion of its situation. It combined the publicity which made attempts at rescue hopeless, with the obscurity engendering forgetfulness. "Out of sight, out of mind" was Elizabeth's hope; and, whatever the effect on contemporaries, her device succeeded so far as, until recently, to blind historians to the fact that out of eighteen years of captivity, Mary spent fourteen in Sheffield.

The nestling retirement of situation once more stood Sheffield in good stead when, in 1745, Prince Charles Edward (who, if tradition could be believed, had found there convenient seclusion for secret conspiracies), poured south with his ragged following. The incursion of bare-legged Highlanders was heralded by frenzied stories of bloody atrocities marking their path. The legend that it was their favourite amusement to impale babies was so abundantly believed that the infant ancestress of an alderman who was one of their vice-presidents was hidden in a holly bush until the modern Herods should have passed. But like their ancestral Picts aforetime, the rabble passed on without turning aside into Hallamshire. So sundry timid citizens, who had incontinently abandoned hearth and home, crept back shamefacedly to endure the jeers of their bolder neighbours. Apart from any "moral and intellectual damage" caused by the raid, Sheffield's loss might be appraised at 7*d.* That was the fee paid by the Cutlers' Company to the bellman when sent round to recall the Corporation to a meeting put off "on account of the rebels being near us." No opportunity for conviviality at taverns was ever lost, and in a few months Culloden afforded legitimate excuse for rejoicings at the Cock, accompanied by an expenditure of 1*s.* 7*d.* for beadles' cockades and of 3*d.* for tobacco pipes. Thus Sheffield emerged from the crisis cheaply, and without the inconveniences that were the lot of more obtrusive towns.

That, however, was the last time when modest seclusion worked for her good. In 1674 were published a hundred maps of the principal roads radiating from London to all parts of England. Sheffield had no place in that elaborate survey of the kingdom. Its existence was contemptuously indicated by a note pointing to a by-road at Nether Haugh as leading "to Shefeild," apparently the way through Wentworth to Chapel-town. The Cutlers' Company's accounts teemed with payments for letters sent by special messengers from places on the North Road, where they were dropped by a postal service that did not condescend to come nearer. Since then public effort had been largely directed towards overcoming the disadvantages of living, as it were, in a *cul de sac*. Even when the railway era dawned, their pioneers, with strange infatuation, passed by on the other side. It took many years to get Quarter Sessions to recognise, except as a humble payer of large tribute, the existence of Sheffield.

It would, then, be readily understood why, in Sheffield itself, there were but few objects of archæological interest to attract examination by the Association. One reference in Domesday was all they knew about Waltheof's Hall. One stone, with chevron moulding, is the only proof of a Norman church. One mention alone was there of an early castle, weakened by a contemporary document in which De Furnival himself called it his house. The Shrewsbury monuments remained the most prized possession of the fifteenth-century church. The old Hall in the Ponds was, in its decadence, the only remnant of the appurtenances of a castle whose materials were utilised to rebuild a town of wood with stone. And there was the manor, whose lodge, with its tragic memories, had

been happily redeemed by the ducal descendant of its build from the decay of the larger structure. Beyond these, what had they? The oldest thing, after their rivers, was probably that goit or mill-race which, now relegated to the status of sewer, fed the lord's mill from time immemorial. But when was asked to point out the most characteristic remnant of Hallamshire of the remote past, he would indicate the survival of the ancient grinding wheels which once studded the streams. These, the most typical relics of the old industrial conditions, had by a tenacious conservatism been hidden down little changed. Happily Hallamshire in some way atoned for Sheffield's archæological poverty, and would have them much to inspect during their meetings.

On the second day the visits began with Blyth Church, about seven miles from Worksop. Dr. John Stokes said the church was built in 1088, and was altered in 1287. It was originally about 60 feet longer, but that much had been cut at the east end. On the old screens were paintings of saints, but he could not identify them. Inside its Norman character is more marked. The pillars are so massive that they divide the church into three distinct portions. There is the nave devoted to present-day services. Beyond the pillars is another church, used for overflow congregations. Beyond that is a third aisle, only much more secluded than the big pillars than an ordinary aisle, used as a lady chapel for week-day services. In the early days the monks occupied the adjoining monastery had one half of the church, and the parishioners the other half. There are many objects of interest, including the old screens, remains of frescoes on the walls, and the broken figure of a Crusader. The tower is of stone and the top is approached by the usual narrow, dark, winding staircase.

Worksop Priory.

At Worksop Priory Church Mr. Charles Lynam gave an account of its architectural features. He claimed that the eastern end of the church was built about 1125. It contained evidences of early Norman work. In the remainder of the building they saw evidences of a "progressive" spirit, and the seed of the Early English style. Mr. Lynam also described the ruins of the lady chapel, and what little remains of the old Priory.

Steetley Chapel.

Steetley Chapel is on the extreme north-eastern verge of the county of Derby. It is small and plain, with not much attempt at ornamentation. It has been restored, but the restoration has carefully preserved all its original features. When last the Association visited Steetley, in 1873, the chapel was a ruin. Mr. R. White announced that the owner was desirous of covering it, to preserve it from further dilapidation, and members expressed the hope that it would be covered, not restored. It was not until Canon Mason became rector at Whitwell that the restoration took place. That was in 1880. The Canon stated that the chapel was then in ruins. The stems of the ivy growing over it were like the trunks of trees. It was growing inside as well as out. Fowls and cats were to be found inside. The change has been complete. The ivy has gone, and everything about the chapel now suggests the most loving care. Canon Mason described the interesting symbolic carving in the chapel and on the beautiful porch.

Barlborough Hall.

Mr. J. R. Wigfull said the hall was built in the Italian style in 1583 for Francis Rodes, Justice of Common Pleas, serjeant-at-law. It has remained in the Rodes family ever since, and is now occupied by Miss De Rodes, a descendant of the founder of the house. Outside and in the house radiates the atmosphere of the sixteenth century. There has been little attempt to "improve it," while every effort has been made to preserve it. In the rooms all the furniture and fittings of those used centuries ago. The grates bear the date 1616. An old box was left by Oliver Cromwell. In another room are letters signed by Henry VII., Henry VIII., Queen Elizabeth I. and the Protector. The chimney-piece in the drawing-room carved in stone, displays the arms of Francis Rodes and his two wives, as fresh-looking as when they were placed there in 1584. Members were spell-bound by the place.

The whole of the third day was given up to visits to Beauchief Abbey, Chesterfield parish church and Winton Manor.

Beauchief Abbey.

During an inspection of the quaint little abbey church Dr. John Stokes outlined its history and traditions, adding many amusing legends. The house was of the order of Premonstratensian canons, probably founded in France by a Norman German nobleman, in 1120. Beauchief Abbey was founded by Robert FitzRanulph in 1162. FitzRanulph was concerned in the murder of Thomas à Becket, and in expiation of his crime founded the abbey which he dedicated to the murdered prelate. Dr. Stokes explained that of the original building only the tower remained, the church being built as recently as 1840.

eventeenth century. The tower, which was built in 1183, originally stood 20 feet higher than at present. When the abbey was built it was not the practice to have aisles, and it was evident that church had none. There was a peal of bells, and a local tradition was that the big bell was taken to Lincoln and is identified with "Great Tom" of the cathedral. Another local "female" tradition was that when that bell rang the milk round the district of Beauchief turned sour. In 1536 the old abbey was pulled down to build Beauchief Hall. The old tombstones and fish-ponds were afterwards inspected.

Chesterfield Church.

Mr. R. T. Gratton acted as guide. Starting at the south-west porch, he said that this porch used to form a very important part of the edifice. It was there that the secular business of the parish was transacted, and the body of anyone whose death had resulted from violence was brought there for the inquest, the jurymen sitting on the stone benches on each side. In a case of accident the body was taken inside and received Christian rites, while that of a person who had committed suicide was taken away to be buried at the junction of our cross roads. Banns of marriage were published from the porch, proclamations were read there, and when the inhabitants had no public hall or covered market it was there that they used to come to make their bargains.

The members then entered the church and took seats in the nave, while Mr. Gratton briefly sketched the history of the structure, and indicated some of its notable features. The original church was very ancient, the nave, which was built last, dating back as far as 1350. The pews at present in use were provided in 1843, but he had evidence of two sets of pews before that date. The only trace of the earliest of these was the end of a pew discovered amongst some back-boards in the chancel roof during its restoration by the Ecclesiastical Commissioners. The large west window was the work of a local working stonemason, who copied it from the north-east window of Henry VII's Chapel at Westminster Abbey. In recent years it had been filled with stained glass in memory of the late Mr. Chas. Markham. The steeple was not the only crooked thing about the place, for the nave pillars and walls were out of plumb, and there was really nothing symmetrical, straight or level. The galleries were an abortion, but Sir Gilbert Scott, who carried out the restoration in 1842-43, was compelled to retain them in order to provide accommodation for all who claimed the right to certain pews. The party next visited the chancel, examined the old pillars supporting the arch which gives access to the Calton chapel; spent some time in inspecting the monuments in the Foljambe chapel (on one of the tombs in which is deposited a "rib" of the dun cow killed by Guy of Warwick); saw the tomb in the wall on the south side, with the effigy of a priest (placed, as Mr. Gratton pointed out, the wrong way about, the custom being for priests to be buried with their feet to the west, while laymen were buried with their feet to the east); visited the chapel of the Guild of the Holy Cross; took note of the finely carved oak screens, and finally entered the vestry, where the registers, which commence in 1558, were shown to them by the clerk, Mr. Geo. Damms.

Wingfield Manor.

The party next journeyed forward to Wingfield. On arrival at the manor house, Mr. J. B. Mitchell-Withers read a paper descriptive of the place and some of the vicissitudes through which it has passed. It was built by Ralph, Lord Cromwell, in the reign of Henry VI. After pointing out the arrangement of the buildings, he said that the main entrance from the inner courtyard to the more important part of the structure was formed by a large porch, now the most perfect portion of the building, surmounted by rich perpendicular battlements, with shields of arms. The banqueting-hall must have been a splendid example of its time, and its fine bay window fortunately remained in a sufficient state of preservation to attract the admiration of all interested in art treasures. Under the hall was a vaulted apartment called "the crypt," and the exact purpose for which it was used had been the subject of much contention. The designers had been at the trouble to light it well, but by its being approached by three staircases from the building and a fourth from the inner courtyard, one could only assume that it had some important use. Mr. D. Leader suggested that it might have been the chapel. Mr. S. O. Addy declared it to be the "spence," where the wine, pices, fruit, dishes, &c., were kept by an officer of the household called the "spenser;" but having regard to the fact that it could be readily approached from the hall, the terraces, the port, the inner courtyard, the battlements, and, in fact, from the buildings generally, his (Mr. Mitchell-Withers's) view was that it was the armoury. After indicating the rooms used as a larder, the buttery and the kitchens, he said that the first floor of the building facing the inner courtyard appeared to have been one storey of considerable height, and, judging by the richness of the window and the small rose window over it,

it seemed probable that this was used as the domestic chapel of the manor house. From the kitchen up a flight of steps the inner courtyard was also reached, and adjoining were the buildings in which Mary Queen of Scots was said to have spent the portion of her captivity passed at Wingfield. It was recorded that those who remembered this portion of the building said that it was the finest portion, but there was little left now save the outer wall, with its fireplaces and windows, and traces of the inner wall. The water supply to the manor house appeared to have been originally through pipes, as they learnt that during the siege in the time of the Commonwealth they were cut, and a well was sunk in the inner courtyard.

Wincobank Camp.

The members on the fourth day devoted attention to Wincobank Hill and Ecclesfield Church. Wincobank had been specially prepared for the visit. It belongs to the Duke of Norfolk, but through the instrumentality of Mr. E. Howarth, F.R.A.S., F.Z.S., the City Council undertook the cost of opening up the old British fortifications. The library and museum committee of the Council voted 100*l.* for the purpose, and the work was entrusted to Mr. Howarth and one of his assistants. For three months he has been engaged upon the ramparts, excavating in various directions, and trying to form some exact conclusions about the interesting old earthworks. He has not found very much. Either the old Britons were careful to carry off all their valuables, or some one has anticipated Mr. Howarth in the hunt for relics of some of Sheffield's earliest inhabitants. He has found some Roman pottery, but, as Mr. I. C. Gould, a vice-president of the Association and a well-known authority on earthworks, remarked, that does not prove that the place was of Roman origin. Romans might have gone there, or pottery which the Romans left behind after they returned to their own homes might have been carried there and left.

Mr. Howarth related what he had found, pointed to old walls he had exposed, and left the members to form their own conclusions. He had clearly traced the foundations of stone walls, had found burnt stones built into the wall and had come across a quantity of charred wood. There are two ramparts, one encircling the other, with a ditch between. The theory at one time was that the Romans constructed the encampment; that gave place to the idea that ancient Britons had a town there. The conclusion advanced by Mr. Howarth was that it had never been an inhabited camp, but simply a place of refuge. The people, he suggested, lived out on the slopes and then took shelter in the encampment on the approach of an enemy.

Mr. Gould thought it was perfectly safe to say that the camp had seen more than 2,000 years of life. It might go back 500 years before the Romans came to England. As a rule the late Celts fixed their encampments on a hill with a more or less flat top. Wincobank was a ridged hill, and his experience led him to say that a camp on a ridge-topped hill was earlier than the others. The finding of bits of flint there was not of much value. They might have been part of the soil.

Mr. Leader spoke about the desirability of bringing to the notice of the town the question of preserving the encampment. If the Duke of Norfolk was approached he thought his Grace would take steps to preserve the place from the rapacious builder, who was advancing on all hands. If the visit of the Association could exert any influence in that direction it would not have been in vain.

Ecclesfield Church.

At Ecclesfield Church Mr. Leader gave the brief descriptive sketch. He referred at the outset to the death of the Rev. Dr. Gatty, who for many years was vicar of the parish, and who took a very active part in the meetings of the Association when last it visited Sheffield. The Lovetots again turned up in the history of this church. They left their mark on Sheffield and Worksop, and Ecclesfield owes its original church to them. It was built about 1141. All trace of that church, however, has gone. The present church was erected during the reign of Henry II. A priory close by was provided towards the end of the twelfth century. There had been an unbroken line of vicars since 1311. The church has been well called the Minster of the Moors. It has a very fine external appearance, with its commanding tower, its flying buttresses and quaint gargoyles. In the churchyard is the tomb of Hunter, the historian of Hallamshire. Gravestone poets seem to have thrived in Ecclesfield. Most of the gravestones have verses of some sort upon them.

Carbrook Hall.

This building was the first visited on the fifth day, where the oak panelled rooms were inspected. Carbrook Hall was in old days the residence of Sir John Bright, who made a name for himself as a Parliamentary leader at the battle of Marston Moor. Built in the early part of the seventeenth century, probably by Stephen Bright, the large panelled room on the ground floor was doubtless the scene of many a council during

the wars of the Commonwealth. Mr. J. R. Wigfull, who acted as guide, called attention to the carving over the chimneypiece, which is said to represent Wisdom trampling on Ignorance. There is another wainscotted room, with good antique carving. As is well known, the hall is now used as a tavern.

Rotherham Church.

When Rotherham was reached, and without delay, the party found their way into the parish church. Mr. E. Isle Hubbard furnished a brief description of some of the notable features of this fine Perpendicular building. There is documentary evidence that Rotherham was a manor before the Domesday survey, and consequently it is probable a Saxon church existed in those early times. That there was a Norman church at a later period is evidenced by Norman remains, and the old foundations discovered during the restoration under Sir Gilbert Scott in 1873. The present church occupies pretty nearly the site of its Norman predecessor, as is proved by the Norman capitals and bases, which had been used for the foundations of the pillars of the present edifice. By a happy arrangement, certain benches are movable, and this early work can be viewed without difficulty. That the older church was smaller than the present one was illustrated by a drawing. The earliest parts of the present church are found in the arcades in the chancel. There is a "squint," or hagiocope, and sedilia for subdeacon, deacon and priest. The tower is older than the nave, and the pitch of an old roof is discernible. The clerestory is sixteenth-century work. In the chancel the finials of the carved oak benches and the old pews came in for attention, and there was much to admire in the ceiling, lady chapel and also in the north chapel, where is the Swyft memorial with its quaint brass, and the keyboard of the organ put in by Snetzler more than a century ago. The tower was of interest, and its date is conceded to be of a period earlier than that of the nave. The remainder of the fabric is generally ascribed to Archbishop Rotherham, who died in 1500, and it is believed that he, if not the sole founder, was a principal contributor to it, and without his assistance it would have been a difficult task even for a parish as extensive as Rotherham was, and aided by the funds of a monastic establishment, to have borne the expense. A choice possession of Mr. Hubbard's is a copy of a fresco which at one time existed over the western arch of the tower. The church plate was displayed in the vestry, and included a chalice and cover of the date of 1571.

A short walk brought the party to the chapel of Our Lady of the Bridge. It is only one of three in this country, and is probably the most interesting. To find the building used as a tobacconist's shop must have been a surprise, and it is certain that the feoffees of the common lands of Rotherham, as custodians, would give considerable satisfaction if they treated the structure as an ancient monument.

Roche Abbey.

The ruins of Roche Abbey were inspected under the guidance of the Rev. H. J. Dukinfield Astley, who told how the Cistercian monks of the Middle Ages, the Puritans of the Monastic Orders, founded the abbey in 1147. He traced the history of the monastic pile until its suppression in 1539, when it was allowed to go to ruin and be used as a quarry for the neighbourhood. Then, in the eighteenth century, "Capability" Brown came along and did further mischief, leaving standing only the two fine arches of the east end.

Laughton Church.

At Laughton-en-le-Morthen the Vicar gave a brief description of the three edifices out of which the present building has been evolved. Then Mr. I. C. Gould headed the way to the neighbouring earthworks, which he described.

Sheffield's Defences.

At the evening meeting Mr. I. C. Gould read a paper on "Early Defensive Works near Sheffield." He first referred to "Carl's Wark," an ancient fortress presenting so weird a picture of loneliness and desolation as to have been likened to an immense blackened altar. How long had elapsed since this spot was fortified Mr. Gould could not say, but there could be no doubt that the name "Carl's Wark" was evidence that to the Norseman who christened it it was an archaic work belonging to the misty days long anterior to his own era. In fortresses on hill-tops, with artificial defences following the natural line of the hill, Wincobank came again under review, and another plea was put forward for those controlling the destinies of Sheffield to use efforts to secure the preservation of the hill and camp and all the slopes leading to it. If the property belonged to the Duke of Norfolk, Mr. Gould did not think his Grace would be found unappreciative of the importance of retaining this valuable relic of the pre-Roman era. Mr. J. D. Leader, speaking of the great earthwork here, and its associated vallum, said:—"So enormous is the work that by our Saxon and Danish ancestors this region was deemed

supernatural, and so ancient that its ridge became for some distance the boundary between the parishes of Sheffield and Ecclesfield." Upon these moundings doubtless stood a Brigantine city or hill fortress, barring the way to the Romans, who quietly and methodically threw up protecting banks forming their camp at Templeborough. Reference was made to the Brough fortress, about eleven miles west of Sheffield, where excavations of the camp are likely soon to be made under the auspices of the Derbyshire Archaeological Society. Mr. Gould also referred to the local tradition of Hengist, the Saxon leader's betrayal and assassination of British king Vortigern, and Hengist's subsequent defeat of Ambrosius Aurelianus, the elected king of the Britons upon Mexborough Plain, Hengist being taken to Conisborough Castle, and there beheaded. The mound and court forts at Laughton-en-le-Morthen, and forts at Tickhill, Mexborough, Bradfield and Conisborough were also dealt with, Mr. Gould pleading for the preservation of the glorious little chapel at last-named, as its late Norman carvings and mouldings were suffering from careless hands or wanton desecration.

We are indebted to the *Sheffield Daily Telegraph* for this report.

LONDON BUILDING ACT AMENDMENT.

A PAPER was prepared by Mr. Bernard Dicksee, district surveyor, for the International Fire Prevention Congress on "Fire Preventive Sections of the London Building Act," treated of the fire sections, their effect upon the construction of buildings, and the following suggestions were offered for amendment of the law where such had been found by experience to be necessary or desirable:—

SEPARATION OF BUILDINGS.

In substitution for Section 74 (1).

1. Every building shall be separated from each of its adjoining buildings by external or party walls or by party arches or party floors.
2. If any building exceeding ten squares in area be divided into two or more tenements, each having a separate entrance and staircase, or a separate entrance from the outer air, every such tenement shall be deemed a separate building and shall be separated accordingly.

SEPARATION OF TENEMENTS WITHIN A BUILDING.

In substitution for Section 74 (3) and 68.

1. In every building exceeding 100,000 feet in cubic extent separate sets of dwelling-rooms tenanted or constructed or adapted to be tenanted in different occupations shall be separated from each other by walls, partitions and floors constructed of fire-resisting materials; and from the common staircase or other approach by walls constructed of brick, stone or other hard and incombustible substances of the thickness prescribed for cross walls; and the floors of the common corridor and passages, and also the landings and stairs of the common staircase approaching thereto, shall be constructed and be carried on supports of fire-resisting materials.

No such building shall extend to more than 250,000 cubic feet, unless divided by party walls in such manner that no division thereof shall extend to more than 250,000 cubic feet, and each such division shall be provided with a separate staircase and entrance affording a direct means of approach from each set of dwelling-rooms in that division to a street or public open space.

2. In every building exceeding 100,000 feet in cubical extent containing separate sets of offices or rooms (other than dwelling-rooms) tenanted or constructed or adapted to be tenanted by different persons, the floors and the principal staircases and corridors shall be constructed of and carried on supports of fire-resisting materials, and the walls of such staircases shall be of the thickness required for cross walls.

No such building shall extend to more than 250,000 cubic feet, unless divided by party walls in such manner that no division thereof shall extend to more than 250,000 cubic feet, and each division shall be provided with a separate staircase and entrance affording a direct means of approach to a street or public open space.

SEPARATION OF TRADE PREMISES FROM DWELLING-ROOMS.

In substitution for Section 74 (2).

1. Every building exceeding 10 squares in area and used or constructed or intended to be used jointly for the purposes of manufacture or trade (whether wholesale or retail) and for dwelling shall be structurally divided into a part or parts to be used for the purposes of manufacture or trade and a part or parts to be used for dwelling.
2. The part or parts to be used for the purposes of manufacture or trade shall be separated from the part or parts to be used for dwelling by walls and floors constructed of fire-resisting materials, and all such walls shall be at least 4 inches in

sickness, or, if more than 10 feet in height and not built in cement, at least $8\frac{1}{2}$ inches in thickness.

3. All openings made in the walls and floors of fire-resisting materials shall be closed by doors and frames of fire-resisting materials bedded solid to the wall or floor.

4. There shall be provided to the part or parts to be used for dwelling a separate means of approach from a street or from an open space, from which reasonable access can be obtained to a street, and all staircases and passages forming such means of approach shall be included within the part or parts to be used for dwelling, and shall be constructed throughout of fire-resisting materials.

5. Where the building extends to more than 50 squares in area two such means of approach shall be provided separate and distinct from each other.

6. All buildings used or to be used wholly or in part for the purposes of manufacture or trade, whether wholesale or retail, shall so far as regards the part used for the purposes of manufacture or trade be subject to the provisions of the Act of 1894, and any amendment relating to the cubical extent of buildings of the warehouse class.

WIDTH OF WAY.

In substitution for Section 13 (5) first proviso and amendment, 1898.

Provided always that no dwelling to be inhabited or adapted to be inhabited by persons of the working class shall without the consent of the Council be erected or re-erected within a distance of 20 feet from the centre of the roadway, so that the height of the ceiling of the topmost storey above the roadway shall exceed 20 feet more than the distance of the front or nearest external wall of such building from the opposite side of such street; and that no building or structure shall be converted into such dwelling-house so as to exceed such height.

UNITING BUILDINGS.

In substitution for Section 77 (1) b.

Such opening shall have the floor, jambs and head formed of brick, stone or iron, or other fire-resisting and non-combustible material, and shall be closed by a pair of party wall doors at a distance from each other of the full thickness of the wall. Such party wall doors shall be of iron at least one-fourth of an inch thick in the panel, and be either hung on pivots and fitted close to rebated iron frames, and secured by bolts or other fastenings at the top, middle and bottom of each stile, or sliding doors or shutters fitted close at all edges into grooved or rebated iron frames; and such party wall doors shall be constructed and fitted in all respects to the satisfaction of the district surveyor.

Provided that the Council may by by-laws or otherwise, after consulting with the District Surveyors' Association, approve the use as party wall doors of doors of fire-resisting material otherwise constructed.

Additional to Section 77 (1) c.

Provided that the Council shall have power where they think fit to allow such opening to be constructed of a width not exceeding 9 feet.

Additional to Section 77.

Where any opening or openings have at any time been made in any party wall or in two external walls dividing buildings, the making of any subsequent opening in such party wall or two external walls shall notwithstanding be deemed to be a uniting of buildings, and no such subsequent opening shall be made except in accordance with the provisions of the principal Act or any amending Act as to the uniting of buildings.

Additional.

Where, before the passing of this Act, any openings have been made in any party wall or in two external walls dividing buildings, the owner or occupier of such buildings shall within six months of the commencement of this Act make application to the district surveyor for a certificate as to such openings. Every such application shall state the situation, area, height, number of storeys, use of each building and the name and address of each occupier and tenant, with particulars as to the occupation and such other information as the district surveyor may reasonably require. On receipt of such application the district surveyor shall make a survey of the buildings, and if the openings be found to be in accordance with the Act, shall issue a certificate to that effect; but if the openings be found to be in any way irregular he shall cause the same to be closed or built up, as the circumstances may require. In the case of openings constructed after the passing of this Act the district surveyor shall issue his certificate on completion of the opening.

The certificate shall run for two years from the date thereof, and at the expiration of that time application shall be made by the owner or occupier for the renewal, when the same provisions shall apply.

Any person who neglects to make application to the district surveyor for his certificate as aforesaid shall be liable to a penalty not exceeding 5*l.*, and the district surveyor may take all proceedings as though application had been made.

Any person who makes an opening in a party wall or in two external walls dividing buildings without giving notice to the district surveyor shall, in addition to the penalty for neglecting to give building notice, be liable to a penalty of not exceeding 20*l.*

Additional.

Where a party wall separates buildings of different heights and in different occupations such wall shall be deemed a party wall for the full height of the higher building, and no opening shall be made in any portion of the wall except in accordance with the provisions of the Act of 1894 and any amending Act as to the uniting of buildings, or as provided in section 101 of the Act of 1894.

LIMIT OF CUBICAL EXTENT OF TRADE PREMISES.

In substitution for Section 75 (First Two Paragraphs).

No building of the warehouse class or other building used or to be used either wholly or in part for the purposes of manufacture or trade, the floors of which are not constructed of fire-resisting materials, shall extend to more than 100,000 cubic feet, unless divided by party walls in such manner that no division thereof extends to more than 100,000 cubic feet. Provided that where the floors of such building are constructed of fire-resisting material the building or division may extend to not more than 250,000 cubic feet.

No addition shall be made to any existing building exceeding the aforesaid limits of cubical extent unless the building be altered to comply with this section; nor shall any addition be made to any building nor to any division thereof, so that the cubical extent of such building or division shall exceed the aforesaid limits.

CONSTRUCTION OF WAREHOUSE BUILDINGS.

Additional.

The following provisions shall (except with the consent of the Council) apply to buildings of the warehouse class and all other buildings used or to be used for the purposes of manufacture or trade:—

1. The roofs, flats and gutters of every such building and every turret, dormer or other erection thereon shall be constructed solid of fire-resisting materials, except the necessary woodwork of doors and frames, windows and frames, skylights and lantern lights.

2. The external walls abutting upon any street or upon any court or light well connected with or adjoining to such building shall, where within a distance of 20 feet from any other buildings opposite thereto, be carried up as a parapet at least $8\frac{1}{2}$ inches thick for a height of 3 feet above the roof, flat or gutter. And all windows in such walls and any skylights or lantern lights lit from such street, court or light well, shall be either fitted entirely with metal frames and glazed with wired glass, or be fitted with fire-resisting shutters capable of being closed and fastened from the inside.

3. In all such buildings exceeding ten squares in area the principal staircases shall be constructed of and carried on supports of fire-resisting materials, and shall be enclosed with walls or partitions of fire-resisting materials carried up to the roof, or where such staircase does not extend to the top of the building be covered in with a floor of fire-resisting materials. And the corridors and passages from such staircases communicating with the street shall be similarly constructed and enclosed.

PROTECTION OF METAL FROM FIRE.

Additional.

Every metal girder, stanchion, column or storey post supporting a wall or a floor or partition required by this Act to be of fire-resisting material shall be protected from the action of fire by being encased to the satisfaction of the district surveyor in concrete, brickwork, terra-cotta or metal lathing and plaster or cement without woodwork of any description. Should any person be dissatisfied with the decision or requirements of the district surveyor he may appeal to the tribunal of appeal.

WOODEN BOARDING AND PANELLING.

Additional.

1. No wooden boarding or panelling shall be fixed as a lining to walls, partitions, ceilings or soffits, in any building of the warehouse class, nor in any other building used or to be used for the purpose of manufacture or trade, nor in any shop or room used in conjunction therewith, unless all the floors, ceilings, flats, soffits, walls and partitions enclosing the room or other space in which such boarding is fixed be constructed entirely of fire-resisting materials, or the spaces between the joists or studs be filled in solid with brick, concrete or other fire-resisting materials, and there shall be no space between such wooden boarding or panelling and the wall partition.

floor, ceiling or soffit, to which it is affixed, other than the thickness not exceeding 1 inch of the battens necessary for fixing such boarding or panelling.

2. No wooden boarding or panelling shall be fixed as a lining to walls, partitions, ceilings or soffits in any dwelling-house unless the floor, wall or partition, or the ceiling or soffit (other than to a roof or flat over which there is no room) to which such boarding or panelling is affixed be constructed of fire-resisting materials, or the space between the joists or studs be filled in solid with brick, concrete or other fire-resisting materials.

INTERNAL PARTITIONS AND WALLS.

Additional.

1. All interior walls and partitions (other than partitions constructed of wooden boarding or panelling) shall, so far as regards the lowest storey at least of such wall or partition, where adequate support is available upon the solid ground or upon a brick wall, or upon a metal girder, be constructed of brick, stone, concrete or other incombustible material.

2. The spaces inside any partition constructed of timber framing shall be filled in solid with brick, stone, concrete or other incombustible material from the level of every ceiling up to the level of the top of the skirting of the storey immediately above.

ONE-STOREY PROJECTING SHOPS, &C.

Additional.

1. The roof or flat over any shop or other premises used for the purpose of manufacture or trade, projecting beyond the main front flank or rear wall of the building of which it forms part, and abutting upon a street or open space adjacent to a street, shall be constructed throughout of fire-resisting materials. And no skylight or lantern-light shall be placed on such roof or flat within 6 feet of any such wall in which there are windows, but all such skylights and lantern-lights shall be so situated as to afford a clear gangway at least 4 feet wide from such windows to the frontage abutting on the street or open space aforesaid.

2. There shall be provided to the storeys above the ground storey of such buildings a means of approach at least 3 feet in width from a street or from an open space from which reasonable access can be obtained to a street, and where such means of approach passes through, along or across the aforesaid projecting shop or premises used for manufacture or trade it shall be separated therefrom by walls, floors and partitions of fire-resisting material and shall be constructed of fire-resisting materials.

EXIT FROM CERTAIN BUILDINGS.

In substitution for Sections 63 and 68.

In every public building and in every building the upper surface of the top floor of which is more than 60 feet above the level of the street, and in every building of the warehouse class and every other building used for the purpose of manufacture or trade, there shall be provided exits from the building by means of one or more staircases communicating with the various parts of such building, constructed throughout of fire-resisting material and carried upon supports of and enclosed by walls of fire-resisting material, and the floors of all lobbies, corridors and passages communicating therewith shall be constructed of fire-resisting materials. There shall also be provided to such building an additional means of escape in case of fire either by a second staircase as aforesaid, or by an external iron staircase or bridge communicating with the ground or with some other building from which access can be obtained to the street, or by some other means that may be approved by the Council, or on appeal by the tribunal of appeal, and the Council may make by-laws under section 164 of the principal Act with respect to such additional exit.

REGULATION OF EXITS OF EXISTING BUILDINGS.

Additional.

1. In the case of any building erected before the passing of this Act that is either (a) a public building, or (b) a building the upper surface of the top floor of which is more than 60 feet above the level of the street, or (c) a building of the warehouse class or other building used for the purpose of manufacture or trade, where it is made known to the Council that the said building is so defective in its structure that special danger from fire by reason of the insufficiency or inadequacy of the means of exit may result to the persons dwelling or employed therein or frequenting or resorting thereto, the Council shall require a survey of such building to be made by the district surveyor.

2. The district surveyor shall make known to the Council any information that he may receive with respect to any structure being in such state as aforesaid.

3. For the purposes of carrying this section into effect the Council may cause such inquiries to be made respecting each building as they may think fit.

4. It shall be lawful for the district surveyor to enter into

any building or upon any land upon which any building is situate for the purpose of making a survey of such building.

5. Upon completion of his survey the district surveyor shall report to the Council his opinion as to the condition of the building and the reasonable means to be adopted to remedy such deficiency or inadequacy of exits as aforesaid, if any.

6. If the certificate be to the effect that such deficiency or inadequacy exists, the Council may cause a requisition to be served on the owner or occupier of the building requiring him to cause such works to be done as can reasonably be demanded under the circumstances of the case. Any person dissatisfied with the requisition of the Council may within twenty-one days of receipt of same appeal to the tribunal of appeal, which shall hear and determine such appeal, and may affirm, alter, or disallow such requisition.

7. At the expiration of the twenty-one days aforesaid, if no appeal have been lodged or where such appeal has been lodged, then upon the decision of the tribunal of appeal, copies of all plans and particulars of any works approved or required by the Council under this Act shall be furnished by the Council to the district surveyor within whose district the building to which such plans and particulars relate is situate, and it shall be his duty to ascertain that the same are in accordance with the said plans and particulars.

8. Upon the completion of the required works by the owner or occupier the district surveyor shall issue a certificate to the owner or occupier and to the Council that the works have been done in accordance with the requisition of the Council or the tribunal of appeal as the case may be. After the issue of such certificate no further requisition shall be served by the Council in respect of the same building.

9. If the owner or occupier fail to comply as speedily as the nature of the case permits the Council may cause a complaint to be made at a petty sessional court, and the proceedings shall be in all respects where the same are applicable thereto as in the case of dangerous structures.

TESSERÆ.

The Colonnade.

THE colonnade, when applied to a superb building, and unbroken in all its parts, isolated from all other buildings and of moderate dimensions, produces at all times a noble and striking effect that no person who has a soul susceptible of impressions of this sort can behold without a sensible and pleasing emotion. When viewed at a considerable distance the amplitude of the shade gives a distinctness to the form, a boldness of relief which, when combined with the uniformity of the wall, leaves an effect that is strongly impressive. As one approaches nearer, the structure seems to increase in magnitude, and the bold projections of the cornice and entablature, now necessarily viewed from below, produce a grandeur of effect that no person who dares to own his feelings will venture to deny. This is the only situation in which this species of ornament can be displayed to the fullest advantage, and this is the very situation in which the inventors of it have chosen to exhibit it. No wonder that men who have seen this situation have admired it; but it is truly wonderful that those who have actually seen it thus exhibited should not have been sensible at the first glance what a very different sentiment is excited by those pitiful imitations of it that they see so profusely scattered throughout all the regions of Europe, and which have been induced to investigate the cause of this peculiarity. The only circumstance that shows they must have felt the effect is the unvarying admiration with which those who have had access to view the finest remains of antiquity talk of them, and the infinite disparity that they admit exists between the modern structures in which the same style of architecture has been employed, and the same proportions most scrupulously adhered to. One characteristic excellence attacks the colonnade that seems to have wholly escaped the notice of its warm panegyrists, viz. the striking effect that a Grecian colonnade is adapted to produce when it is viewed as a whole. If we could suppose that men, when they were contriving to erect a building that was to be constructed of the most durable materials they could procure, and which were obviously intended to stand as long as the art of man could effect, had their eye the appearance which that building would exhibit when it fell at last into ruins, we should be compelled to attribute to the Grecian artists a very high degree of excellence. It will be admitted that no other structures that have hitherto been contrived by man (not the Gothic church itself excepted) can be compared with them in this respect. In the state of ruin all the characteristic defects of this style of building disappear, and those excellences which tended to render it pleasing in the perfect building acquire additional power to render it an object superlatively attractive. The bold proportions now acquire additional power, and, suspended by

ce of the cement (which age alone can give) and the interpoises that accidents sometimes provide, they assume appearance that is picturesque. The light, too, often seen between the yawning gaps of the tottering architrave above ves to these massive shades an effect that is sublime.

Architectural Models.

The model, which seems the most certain guide of all architectural representation, and which has at least the advantage being intelligible to those who are not conversant with geometrical designs, may if incautiously trusted greatly mislead. It is indeed an exact representation of the building, but nothing more; there is no positive scale for the eye, so that their fancy or inclination may exaggerate its dimensions and bestow upon it an importance the building itself will not possess. Sometimes indeed a figure is put in to serve by way of scale, but even this will not entirely guard against delusion, because the building is to be in the immediate vicinity of others, its height will be more or less affected by theirs. What may be exceedingly well proportioned in itself and have a sufficiently dignified look when considered apart from any other object may make a very different figure when it comes to be built. Feeling that it ought to have superior importance and to display itself to the best possible advantage, people take it for granted that such will be the case; therefore it is no wonder they afterwards feel something like disappointment should they happen to find the structure itself, as will sometimes happen, look little better than an overgrown model, being much lower than the houses above which they fancied it was tended to rear its height. Even they who are aware that the building will not be so lofty as those on either side of it do not always make due allowance for the difference, and the difference of effect so occasioned may greatly exceed that of positive measurement. Delusions of this kind might easily be guarded against by having cardboard elevations of a part of each adjoining building that may be fixed up against the model for pleasure. By way of further precaution, if the building is to be in a street, or in any other situation where the view of it will be limited to a certain distance, that distance should be accurately marked by scale and a card with a hole in it fixed at the natural level of the eye, so that the model can be seen through that aperture under precisely the same angle of vision as the building really will be. This would not at all hinder the model from being completely examined or viewed in any other direction, as the card or board might be attached to a thin wire made to hook on the model stand whenever required. It may here be observed that models are seldom placed properly, the consequence of which is that we generally look down upon them as in a bird's-eye view, whereby much of their proper effect is quite lost. This defect might be remedied, and the advantage of being able to inspect the roof still secured were the stands upon which models are placed so constructed as to allow them to be raised or lowered at pleasure by means of a screw and winch handle. Another circumstance which renders it prudent not to trust too implicitly to models is that they do not express colour, particularly if executed in plaster. They enter the eye by that brilliancy of decided and uniform white which not even a newly erected stone building possesses; consequently they rather show a degree of beauty which is desirable than one which is attainable; that is, what persons in general would consider to be such, although in a painter's imagination it would more frequently than not be considered a defect. Hence a model is apt very frequently to mislead the judgment, and more especially to impose upon those who, lighted with it as a miniature resemblance, think that because the model looks "very pretty," the building must of course be very beautiful. Unless the windows are real apertures, it is desirable that they should be coloured of a tolerably dark colour, since if that be not done they will have the effect of blank windows, thereby occasioning an appearance of breadth and looseness which the real structure cannot possess. In spite of these drawbacks, which by being known and kept in mind are reduced to very trifling ones, models recommend themselves by the decided advantages of their own, since they enable us to study every imaginable effect of light and shade and of perspective. Besides which a well-executed model is in itself a really pleasing and ornamental work of art.

Greek Architects as Slaves in Rome.

The Greeks, when transplanted to a foreign soil, from kings and rulers became strangers and slaves, could not in their fallen state retain the sentiments, the emulation of freedom. They naturally began to prefer such a deviation from the painful and sober adaptation of ancient forms to new uses as should insure to them present employment and that degree of marketable fame which might contribute to the acquisition of those advantages suited to their condition; nay, perhaps wishing to repay their wrongs to the Romans by combining with an open obsequiousness to the most absurd dictates whatever revenge they could still exact from them, and to repay with secret ridicule the open insult

received from them, were probably even anxious in lending them their architecture to employ it in the manner most inconsistent with its original principle, most calculated to prove and expose the ignorance and bad taste of their employers. Thus what remained of Grecian architecture became completely degenerate in the Roman territory. In the former the column was a more characteristic and essential feature than the wall, since it supported a greater proportion of the weight, seemed rooted in the deep recesses of the soil like the oak in its native forest, and rose in single stem, continuous in substance and robust in frame, from the surface of the earth to the entablature. Notwithstanding its great individual strength and diameter, it was so approximated to many more of a similar nature, which shared with it the burden of the superincumbent masses as to give the greatest solidity to the edifice, and to gratify the spectator with the richness and variety of form, combined with the appearance of vigour and durability. In the latter, a continuous wall, capable not only of supporting great perpendicular weight, but of enduring considerable oblique pressure, was an indispensable requisite for the continuous vault, and naturally became an object of greater consequence and attention than columns. These, indeed, needed only to adorn its nakedness, placed too far from the main building to be embodied with it or to add to its strength, instead of rising directly from the plinth or stylobate, were separated from it, and raised upon a clumsy square block which, under the name of pedestal, seemed interposed to interrupt the connection between the shaft and the floor; by its size to narrow the passage, and by its protruding angles to inconvenience or to hurt the passengers. Frequently, as in the triumphal arches of the emperors, that pedestal became so lofty that instead of raising the columns on a sort of cothurnus, it lifted them on a positive stilt, and not only cut off their connection with the ground, but made them appear as if tottering in air. Where the pedestal occupied a greater space between the soffit and the stylobate, less remained for the column, which became shorter, thinner, weaker, requiring instead of affording support; its apparent weakness exceeding its real debility like an appendage not wrought for the building, but borrowed from some smaller structure, and only carried to the requisite height by the aid of materials which did not belong to it. As they became weaker, like the limbs of an unhealthy child, they were stretched to a greater distance from each other, and were no longer capable of bearing an entablature diminished to their own proportions. In order fully to confirm their inutility, they were not made to carry any such, but of an architrave directly supported by the wall itself (a continuation of that wall, indeed, under a different denomination), such projections or knots as did not exceed their own diameter, and appeared fitter for the purpose of steadying the useless pillar than the pillar for that of carrying an unmeaning entablature. The effect produced was that of a second capital mimicking the first; confusing its form and destroying its appearance, causing as great a multiplication of breaks and angles and of clumsy mouldings as arises from the equally useless pedestal underneath. At other times, again, to show the inutility both of the column and the entablature still more evidently, both were, as in the recesses of the Pantheon, placed within an arch totally independent of either, so that the column carrying the entablature, but the entablature carrying nothing, the former only appeared for the purpose of supporting the latter, and the latter for that of tying together the former.

Hindu Columns.

Indian pedestals and bases are made more systematically, and afford by far a greater variety of proportions and ornaments than the Grecian and Roman. In European architecture the forms and dimensions of the pedestals and bases are fixed by invariable rules with respect to the orders in which they are employed, but in the Indian the choice is left to the option of the artists. The capitals of the Grecian columns invariably mark the distinction of the several orders; those of the Indian are varied at pleasure, though not without regard to the diameter and length of the shaft, and the forms of the plainest of them, though they have in reality nothing in common with the Grecian orders, are found at a distant view to bear some resemblance to the Doric and Ionic capitals, but those of a more elaborate kind are sometimes so overloaded with a sort of filigree ornaments as to destroy the effect of the beautiful proportions of the whole. The Egyptian capitals, on the other hand, are formed into elegant vase shapes, decorated with the stalks, leaves and blossoms of the lotus, and occasionally with palm leaves, which latter ornaments are supposed to have given the first idea of the Corinthian capitals. And in some specimens the Egyptian capital is composed of the representation of the head of the goddess Isis. The entablature of the Indian order admits of little variety, as well in its composition as in its relative proportions, whereas the same member in the Grecian and Roman architecture is varied for each order both in form and magnitude. The massiveness of

the Indian entablature offers a striking contrast to the lightness of the Grecian, but the richness of the former may be said to be unrivalled. In the existing treatises on Hindu architecture no mention is made of anything like a substitution of human figures for columns to support the entablature, but the shaft is directed to be adorned with the figures of demons and animals, yet various examples are to be met with in which human figures as well as representations of animals are employed in bold-relief in the sides of pillars in temples and porticoes, but by no means like those found in Egyptian architecture. The antiquity of this invention in India is not determined, but the Grecian architects refer the origin of their caryatides to the commemoration of their captivity of the Caryan women, while others assert that it was derived from an Egyptian source.

Union of Arts in Italian Buildings.

In Italy there scarcely exists any fine monument of architecture which is not, thanks to those who were its authors, the result of the combined knowledge and practice of different arts. The reason of this union of talents, formerly so common, but now so rarely met with in one man, is that formerly the common point of instruction in these different arts was the study of nature, manifesting to each, according to its style and under its direct or indirect affinities, the physical or moral qualities of this great original. Everyone read and appropriated to himself the laws and effects of unity and variety, and understood the harmony of form, outline and proportion. Instructed by and imbued with these grand principles, every artist by the practice of drawing could apply them to the different arts as to different dialects of the same language, and knew how to pass from one form to another without changing anything in the groundwork of the skill which enabled him to design each. Thus it was often seen that an artist, compelled by chance to the exercise of an art of which till then he had no experience, suddenly developed aptitude in it, which would now appear to be the result of the devotion of an entire life. The history of architecture furnishes a multitude of examples of this kind. Vasari, in his "Life of Baccio d'Agnolo," remarks that this art, more peculiarly than any other, has been exercised by a great many men who had not made it a special study, and who were even ignorant of its technical terms. To which this writer, who was himself both a painter and architect, adds "that no one could excel in architecture without sound judgment, a knowledge of drawing or the habitual exercise of painting and sculpture. The cause of the facility," continues Vasari, "with which painters and sculptors learn architecture is that, both from the affinity of statues with edifices and the necessity of employing architectural compositions in pictures, they are forced to make themselves acquainted with this art and to study its relative proportions."

Sebastian Serlio.

The study of Vitruvius inspired Serlio with an eager desire of obtaining greater insight into the practice of the ancients by examining and making drawings of what remained of their structures—at that time the only method by which any knowledge of them could be acquired, for although many buildings were then to be seen in a perfect state in comparison with what they are at present, that advantage was counterbalanced by there being no accurate delineations published for the instruction of those who could not visit the edifices themselves. After staying some time at Pesaro, Serlio proceeded to the Venetian States, where he employed himself in examining and measuring the amphitheatre and bridges at Verona. He subsequently visited both Vicenza and Venice, erected a theatre in the former city, and in the other made designs for the church of San Francesco delle Vigne. During his residence in the last-mentioned city he became acquainted with San Micheli, Sansovino and other architects of note, and he himself would doubtless have found employment there, being noticed by the Doge Andrea Gritti, if his passion for exploring antiquities had not induced him to pass over to Pola, of whose amphitheatre and other Roman remains he was the first to publish any architectural account. On his return he examined those of Ancona, Spoleto, &c., and afterwards those of Rome, many of which are introduced as illustrations, but certainly not as embellishments, in his work on architecture, they being there represented in most coarsely-drawn and executed woodcuts. It was while he was at Rome that he composed his treatise on the five orders, for a copy of which he was complimented by Francis I. with 300 gold crowns. Invited to France by that monarch in 1541, he was there appointed architect at the palace of Fontainebleau, and was also commissioned to undertake the court of the Louvre, but generously declined in favour of Lescot, whose designs he recommended to be adopted as being superior to his own. After the death of his royal patron he retired to Lyon, where he remained for some time in exceedingly straitened if not in indigent circumstances, but he returned again to Fontainebleau, and died there in 1552 in his seventy-seventh year. His reputation rests chiefly upon his writings,

"Opere di Architettura, Libri Sei," which display more taste and learning than taste, and which, highly as they were at the time esteemed, possess little real value at the present day.

THE NATIONAL GALLERY.

THE following additions have recently been made to the National collection:—Sir William Agnew has presented the portrait of Mrs. Hartley and her child in the character of "Nymph with the Infant Bacchus," which was at the exhibition of the old masters at the Royal Academy in 1896. It is placed in Room XVIII. in the Gallery in Trafalgar Square. A portrait of an elderly man by Lucas Cranach the Elder has been presented by Mr. J. P. Heseltine, one of the trustees. It is hung in Room XV.

A picture by Zurbaran has been purchased from the collection of the late Louisa Lady Ashburton. It represents a lady in the character of St. Margaret; the dragon, the emblem of this saint, is seen in the background. It will shortly be hung in Room XIV.

GENERAL.

About 150 Students and some professors of Russian Universities arrived at Athens on Monday with the object of visiting the Greek antiquities. The Government ordered the museums to be open the whole day, and instructed the municipal inspectors to act as their guides.

Building Permits for 1,274 houses in Berlin have been granted between January and June this year. The number of shops erected during that period is 550.

Lambeth Palace Library will be closed for the recess on the 28th inst. The entire series of the Society of Archaeological Society has lately been acquired.

A Chancel Screen is to be erected in the church of Middleton Tyas, near Richmond, Yorks, as a memorial. The design has been prepared by Messrs. J. P. Pritchett & Co., architects.

The American scientific expedition has been compelled to abandon its plan of extensive excavations at Babylon, which preparations have been made for the last three years. The abandonment is due to the persistent refusal of the British Government to permit the American Society to carry on such work, although it has readily authorised excavations by other nations.

Mr. E. Clutton, sole arbitrator in the inquiry which was held recently at the Surveyors' Institution—"Blundell and the Secretary of State for War"—has issued his award. The proceedings had reference to 40 acres of sandhills a few miles from Liverpool, and also to 700 or 800 acres of foreshore lying in front of them. The claim approximated to 550 acres. The land was compulsorily acquired by the War Office for the purposes of a fort for gun-firing practice. The arbitrator's award amounts to 17,642l.

In the Cathedral Library at Peterborough amongst MSS. and records bequeathed by Bishop White Kennett is a small volume of the fourteenth century containing copies of ancient charters relating to the borough has been found. The book is endorsed by Bishop White Kennett as having been bought by him at Cambridge in 1714. A deed was found slightly fastened to one of the pages, and was discovered to be an original charter of Edward the Confessor to the Abbot of Burgh, dated 1060. The charter, which conveys the manor of Fiskerton to the Abbot Leofricus, is in excellent condition.

The First Prize in the competition for the Limiting Carnegie Free Library has been awarded to Mr. George Beckett, of Dublin, and the second to Mr. G. P. Sheridan, of Dublin, whose design has been adopted for erection by the trustees.

Dr. W. E. Corfield, the sanitary adviser to His Majesty's Office of Works, died on Wednesday last at Marstrand, Sweden. All his inventions have been entrusted to Messrs. Thomas Crapper & Co., Marlborough Works, Chelsea.

Mr. T. S. Robertson, architect, of Dundee, from whose designs St. Margaret's parish church, Arbroath, was built, has been commissioned to complete the tower, and the tender by Messrs. Ramsay & Gordon has been accepted.

A Petition having been forwarded to the Postmaster-General from residents in Alexandria, N.B., against the proposed site in Bank Street near the railway station acquired some time ago by the Post Office authorities, and a counter-petition in favour of the site having been also forwarded, the Postmaster-General has decided the matter by intimating through his secretary that the site already selected will be adhered to and that building operations are about to commence.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

AYLESFORD.—The Maidstone Town Council invite designs and estimates for a stone single-span bridge over the Medway at Aylesford, Kent. Premium 100 guineas offered for design signed premier place. Details can be obtained on application to the Town Clerk, Maidstone.

BLACKPOOL.—Aug. 31.—Competitive drawings are invited for new offices to be erected at the corner of Sefton Street and Victoria Street, Blackpool. The architect whose design is selected will be appointed to carry out the work. The competition is limited to architects having offices and practising in the water area of the Fylde Water Board. Mr. C. J. Dawson, 34 Victoria Street, Blackpool.

BRIGHTON.—Nov. 9.—Designs are invited for a new hospital. Premiums of 50l., 30l. and 20l. will be paid to the second and third premiated designs respectively. Papers up to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Brighton and Hove Hospital for Women, 76 West Brighton.

DUBLIN.—Sept. 30.—Designs and specifications wanted for workmen's cottages, semi-detached or terraces, each cottage not to exceed £100. The successful plan to become the property of the company on payment of £20. Mr. Francis B. Ormsby, Great Southern and Western Railway, Kingsbridge Terminus, Dublin.

ELHAM.—Oct. 7.—For sewage disposal of the village of Saltwood. Report, plan and estimate of probable cost. Premium 30 guineas. Further particulars, Mr. R. Lonergan, 11 Cheriton Place, Folkestone.

HEYWOOD.—Sept. 14.—Competitive designs are invited for a library building to be erected in Church Street at a cost of 4,500l. Premiums of 30l., 20l. and 10l. will be awarded for designs adjudged of sufficient merit and placed first, second and third in order respectively. Mr. J. Ainsworth Settle, Municipal Buildings, Heywood, Lancs.

HOWDEN.—Sept. 12.—Plans and estimates are invited for improving and extending the sewerage of the contributory place of Howden. The successful competitor will be awarded a sum of 15l. and the usual commission for superintending the execution of the works. Mr. Henry Green, clerk.

IRELAND.—Sept. 30.—The Great Southern and Western Railway Company offer a prize of 20l. for the best design and specification of workmen's cottages, built either semi-detached or in terraces. Mr. Francis B. Ormsby, secretary, Knightsbridge Terminus, Dublin.

LEYLAND.—Sept. 26.—Plans are invited for the laying-out and development for municipal and other purposes of about 11,902 square yards of land in Church Road and Sandy Lane, Leyland, Lancs. A premium of 15l. 15s. is offered to the author of the plan considered to be the best design. Mr. M. H. Wilkinson, surveyor, 21 Towngate, Leyland.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75l. for design placed first, and one of 25l. for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100l., 50l. and 30l. respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

SCOTLAND.—Sept. 22.—Competitive plans are invited for the erection of a hospital and offices. Conditions of the competition and full particulars may be obtained from Mr. J. E. Shaw, clerk to the Lunacy Board, County Buildings, Ayr.

CONTRACTS OPEN.

AYLESBURY.—Sept. 1.—For repairing, painting and decorating the town hall. Mr. J. H. Bradford, surveyor, Town Hall, Aylesbury.

BALBY-WITH-HEXTHORPE.—Aug. 28.—For additions and alterations to Hexthorpe mixed school. Mr. F. W. Masters, architect, St. Vincent, Doncaster.

BARKING.—Sept. 8.—For the erection of eighteen four-roomed cottages and twelve six-roomed cottages, in two blocks respectively, adjoining the workmen's dwellings in King Edward's Road. Mr. C. J. Dawson, architect, East Street, Barking.

BATLEY.—Sept. 4.—For additions to the town hall. Messrs. Walter Hanstock & Son, architects, Branch Road, Batley.

BATLEY.—Sept. 5.—For the erection of an approach tower to the Independent Methodist chapel, Cambridge Street, Batley. Mr. O. J. Kirby, borough surveyor, Branch Road, Batley.

BERMONDSEY, S.E.—Sept. 3.—For the construction of offices, &c., at the town hall, Spa Road. Mr. R. J. Angel, borough surveyor, Town Hall, Spa Road, S.E.

BERMONDSEY.—Sept. 8.—For the erection of buildings in connection with extensions to the dust-destroyer house, electric-light station, boiler-house, &c.: Mr. R. J. Angel, borough surveyor, Town Hall, Spa Road, S.E.

BIRMINGHAM.—Sept. 10.—For the construction of a retaining wall at Bordesley and of a culvert near Olton. Mr. G. K. Mills, secretary, Great Western Railway Company, Paddington Station.

BIRMINGHAM.—Sept. 16.—For the erection of engine and boiler-houses, including seatings for five Lancashire boilers and the construction of a new flue, adjoining the present pumping station at Monument Lane, Edgbaston, Birmingham. Mr. Edward Orford Smith, town clerk, Council House, Birmingham.

BRADFORD.—For the erection of the industrial hall of the Cartwright Memorial Exhibition, Bradford (1904). Messrs. Ledingham & Edwards, joint-architects, District Bank Chambers, Bradford.

BRIDLINGTON.—Sept. 2.—For repairs at 1 Victoria Terrace. Mr. A. E. Matthewman, town clerk, Town Hall, Bridlington.

BRISTOL.—Aug. 31.—For the erection of one or two warehouses at Cumberland Basin. Mr. W. W. Squire, engineer, Engineer's Office, Underfall Yard, Cumberland Road, Bristol.

BRISTOL.—Sept. 10.—For the erection of school buildings in Hanham Road, Kingswood, near Bristol, to accommodate 990 children. Mr. John Mackay, architect, Richmond Place, Kingswood, near Bristol.

BURTON-IN-LONSDALE.—Aug. 31.—For the erection of a Wesleyan Sunday school and classroom at Burton-in-Lonsdale. Mr. Robt. Richardson, Halfway House, Cantsfield, Kirkby Lonsdale.

CAIRO.—Feb. 1, 1904.—For the construction of three bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CANNOCK.—Sept. 7.—For the construction of an iron and wood infectious disease isolation hospital, comprising administration and mortuary blocks and wards to accommodate sixteen patients. Mr. Herbert M. Whitehead, surveyor, Ince, near Stafford.

CANNOCK.—Sept. 8.—For certain works at the workhouse, Cannock, Staffs, in connection with (a) rebuilding and addition to the laundry and washhouses, and (b) the provision and fixing of steam-engine and laundry machinery. Mr. A. To Veall, architect, 84 Darlington Street, Wolverhampton.

CARLISLE.—Sept. 1.—For the erection of twelve houses, Margery Street, Carlisle. Messrs. Johnstone Bros., architects, 63 Lowther Street, Carlisle.

CHELMSFORD.—Aug. 31.—For alterations and additions to the laundry at the union workhouse. Messrs. Chancellor & Son, architects, Chelmsford.

CHESTER.—Aug. 31.—For the erection of twelve cottages on part of the Tower Field Gardens, Dee Basin Road, Chester. Mr. J. H. Dickson, deputy town clerk, Town Hall, Chester.

CLITHEROE.—For the erection of a Catholic church, Clitheroe, Lancs. Mr. J. C. Howard Sandbach, architect, 15 Richmond Terrace, Blackburn.

CONSETT.—For alterations and additions to dwelling-houses at the Middles Farm, near Consett, Durham. Mr. R. G. Norman, 5 Rosebery Terrace, Consett.

COVENTRY.—Sept. 8.—For the erection of science building at the King Henry VIII. school, Coventry. Mr. F. V. Chattaway, architect, Trinity Churchyard, Coventry.

COVENTRY.—Sept. 14.—For the erection of thirteen cottages at Wolston, near Coventry. Mr. Herbert W. Chattaway, architect, Trinity Churchyard, Coventry.

DARENTH.—Sept. 5.—For (1) sanitary work and repairs to corridor floors at the adult and schools department, and (2) cleaning and painting work at the schools department, Darenth asylum, near Dartford, Kent. Mr. T. Duncanson Mann, clerk, Metropolitan Asylums Board, Embankment, London.

DARLINGTON.—Sept. 2.—For the erection of twelve houses in Grey Street, Darlington. Mr. Rispin, 50 Thornton Street, Darlington.

DARLINGTON.—Sept. 3.—For rebuilding and enlarging of the Red Lion hotel, Darlington. Mr. G. Gordon Hooper, architect, Court Chambers, Darlington.

NEW CATALOGUE.

MESSRS. MABIE, TODD & BARD, 63 Cheapside, London, E.C., announce the issue of a new fully-illustrated catalogue of their well-known "Swan" fountain pens and "Cygnet" stylos. All who at present possess one of these excellent pens, and all those who do not, should write for a reference copy, which will be sent post free, and which cannot fail to be of interest.

TRADE NOTE.

THE new schools, Egremont, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates and special inlet tubes, by Messrs. E. H. Shorland & Brother, of Manchester.

A NEW United Methodist Free church (Manchester Third Circuit) and Sunday schools were opened at Gorton last week. The necessity for the new buildings has been brought about by the development of the district and the rapidly increasing population. The edifice is situate in Hyde Road, the principal thoroughfare from Manchester to Hyde, and the building is substantially constructed and in a neighbourhood where there is plenty of opportunity for building up a strong church. The church and schools have been built at a cost of 3,000l.

ELECTRIC NOTES.

THE Westminster City Council has, we understand, decided to extend its system of electric lighting from Exeter Street, Strand, the boundary of the parish of St Martin's-in-the-Field, to the Law Courts, and also to light by electricity the thoroughfares of Kingsway and Aldwych. The first standard has been erected at the end of Burleigh Street, and the base of a column fixed near the City boundary. The standard will be fixed alternately on either side of the thoroughfare at a distance of 35 yards, on the "islands" in the centre of the roadway, and round the churches of St. Mary-le-Strand and St. Clement Danes. They will be 24 feet high, and will be fitted with arc lamps each of 1,000 candle-power. The Council will erect the standards and provide the fittings, and current will be supplied under contract by the Charing Cross and Strand Electricity Supply Corporation (Limited). It is anticipated that the Strand portion of the scheme will be completed in three weeks.

A SPECIAL meeting of the Redditch Urban District Council was held on Tuesday evening (Mr. A. Townsend presiding), to hold a conference with Mr. Monkhouse, the expert engaged to report upon the electric light undertaking. The clerk informed Mr. Monkhouse that, after considering his first and supplementary report, the Council had decided that provision should be made in the proposed new loan for the new starting gear recommended and four sets of watt-meters. Upon a question of the provision of new gas-producing plant to enable the Council to use bituminous coal for gas production instead of anthracite coal, Mr. Monkhouse strongly favoured an alteration of method. The cost of the alteration would not exceed 500l. The cost of anthracite coal to the Council is 17s. 9d. per ton. The bituminous coal could be bought, delivered at Redditch, at 7s. 6d. per ton. Another point discussed was as to the reduction in the cost of production per unit, and on this point Mr. Monkhouse repeated his belief that under the new conditions a considerable reduction in the cost of production would be secured. In reply to further questions, Mr. Monkhouse repeated that it was not necessary to make any allowance for depreciation if the plant was maintained in good working order out of revenue. He also said there would be no need of any addition to the existing staff. He recommended that the sale of power for motor purposes at present prices (1d. to 2d. per unit) be continued, as in any case the plant had to be running continuously during the day under the

alternating current system. Asked by Mr. J. Johnson as to how they might turn the present loss of about 1,000l. a year to a profit, Mr. Monkhouse replied that it depended upon how rapidly they could get new customers.

VARIETIES.

ESSRS. CASTLE, of 40 Chancery Lane, London, W.C., have been appointed by the Stockport Union to value the railway, gas, water, electric light and other public properties.

LIVERTON CHURCH, Yorks, was reopened on the 19th inst., after undergoing restoration under the supervision of Mr. H. Fowler, of Darlington, at a cost of about 800l.

THE *Model Engineer and Electrician* of last week contains the first of a series of special articles on the subject of "The Electric Lighting of a Private House," by Frederick H. Taylor, A.M.I.E.E.

H.R.H. PRINCESS LOUISE, Duchess of Argyll, opened on the 25th inst. the new technical schools in Abbey Road, Glasgow, which have been built as a public memorial of the late Queen's reign at a cost of 20,000l.

ON the 25th inst. the memorial church recently erected at Mornish, N.B., by Mr. and Mrs. Todd, Mornish Lodge, was opened for service. The building is of stone and finished inside with oak. It presents a very neat and tasteful appearance. In the east end there has been erected a fine window, brought in from America and costing 1,300l.

THE opening of St. Paul's new Congregational church, Glasgow, took place on Wednesday afternoon. The new church

occupies the site of the old structure in Standish Gate, with extensions in the rear. It provides accommodation for 750 persons, and the cost amounts to about 6,000l., the architect being Mr. F. W. Dixon, of Manchester, and the contractors Messrs. J. Wilson & Sons, of Wigan.

THE death took place on the 22nd inst. of Mr. Thomas Wardrop, one of the senior members of the firm of Harris & Wardrop, builders and contractors, of 10 to 14 Wallwood Street, Limehouse, E.C. The business will be carried on as heretofore by the remaining partners, Messrs. Edwin Harris, Clarence Gregory and James Wolfe King.

THE death took place on Sunday at Caerwys of Mr. Henry Indel, formerly surveyor to the Holywell Turnpike Trustees and subsequently to the Holywell District Highway Board, at the age of seventy-seven. He was a native of Minera, Wrexham, and in his earlier years was connected with several important enterprises in North Wales, including the reconstruction of the Denbigh and Ruthin and the Wrexham, Mold and Connah's Quay Railways. He subsequently became manager of Parry's mine works at Holywell prior to entering the service of the Turnpike Trustees.

THE committee of management of the Hospital of St. Francis—until recently in the New Kent Road—have been fortunate in securing a large and substantial house (Darent House) at Camberwell Green, S.E., which, as soon as the necessary alterations, &c., are completed, will be thrown open to the public as a general hospital, under the designation of the South London Hospital, or Hospital of St. Francis. The building, which almost adjoins one of the institutions of the Metropolitan Asylums Board (the Remand Home), will provide four or five large wards, &c., and an out-patients' department at the rear.

THE reconstruction of the Midland hotel, New Street, Birmingham, has now been completed. The hotel has been greatly improved and modernised at a cost of about 90,000l., with an additional 30,000l. for furnishing. It can now claim to be one of the most convenient and luxurious hotels in the provinces. In carrying out the work considerable difficulties had to be surmounted by the architects, Messrs. Henman & Cooper, and the builders, Messrs. Barnsley & Sons, in order to realise the best results. The building now contains over 160 bedrooms, and has main entrances from New Street and Stephenson Street, and separate entrances for the members of the staff, tradesmen, &c. The public entrances and the lower

and ground-floor rooms have their walls of Grecian marble. The whole of the interior is furnished on the most elaborate and, at the same time, useful lines, everything being in modern style. The sanitary arrangements are exceptionally complete. A distinctive feature is the water supply, which is procured from a well sunk to a depth of 600 feet. The water is driven afterwards by compressed air into storage tanks in the roof. Throughout, the building is, so far as the new portion is concerned, fire resisting, and in the case of any outbreak precautions have been taken to provide ample means of exit.

BUILDING AND BUILDERS.

ON and after September 1 carpenters working under the Truro master builders will receive an advance of 2s. per week.

THE Board school which has just been completed at Halifax cost 29,500l., and provides accommodation for 1,000 children; special attention has been paid to the ventilation. Messrs. Horsfall & Son were the architects.

AT an inquiry held by Colonel W. Langton Coke at York into the application of the City Council for approval to borrow 98,465l. for asylum purposes, it was stated that a contract had been entered into with Messrs. George Longden & Sons, Sheffield, for the erection of the main buildings at a cost of 90,453l.

THE alterations at the Savoy Theatre are now making very satisfactory progress, and will, it is anticipated, be completed before the end of September. In addition to a complete re-decoration of the house both inside and out, the chief improvement will be a new broad level roadway from the Strand to the main entrances of the theatre.

A PAINTER named Frederick Barrett was at work on a ladder at Ilford station on Monday morning when an up-express struck the ladder and hurled the man into the air. Barrett fell upon the train and then dropped upon the down-line as another train was approaching. A comrade dragged him from the metals, and he was conveyed to the West Ham Hospital, having sustained shocking injuries.

THE church of St. John the Baptist, Hulme, is just now closed for public worship, as it is undergoing a long-needed renovation. The outside fabric was dealt with last year and

was put into a state of sound repair at a cost of nearly 300l. The interior is now receiving attention, and is being thoroughly cleaned and redecorated. It is expected that the church will be reopened on Sunday, September 13.

AT Sutton Coldfield Congregational church it has been decided to take down a partition wall separating chancel and transepts from the nave, and to furnish the chancel end of the church at a cost of 1,600l. More than 4,000l. has been spent in extension during the last three years, and it was resolved that this last piece of work should not be commenced until 800l. had been promised. The amount was raised in three days.

A SHOCKING accident occurred on Tuesday in Montague Street, Edinburgh. James Brogan, a workman residing at French Street, Bridgeton, Glasgow, and in the employment of the National Telephone Company, was at work on the roof of a house in Montague Street when he lost his footing and fell from the roof on to an iron paling beneath, the spikes of which passed through his body. He was removed to Edinburgh Royal Infirmary, where he succumbed to his injuries shortly after admission.

MR. S. W. HEATON, M.D., Local Government Board inspector, held an inquiry at the Birkdale town hall on Wednesday, regarding the application of the Birkdale Urban District Council for sanction to borrow 2,750l. for the provision of an infectious diseases hospital. Evidence was given by the clerk, the surveyor and the medical officer supporting the application. The site of the proposed hospital, in which it is intended to make provision for eighteen beds, is in Shaftesbury Road. The medical officer emphasised the necessity of a speedy reply on the part of the Local Government Board, as the accommodation was much needed. After the inquiry the inspector visited the site.

HAVING obtained the sanction of the Local Government Board, the Stretford (Lancs) District Council will soon commence the erection of 112 semi-detached artisans' dwellings, with a 6 yards frontage to each. There are only one or two similar schemes in England in which the houses are semi-detached, the Council being enabled to give this advantage owing to the low price of the land. The cost of the land is 3,750l., and the total amount proposed to be borrowed is 24,000l. If the Council succeed in getting sixty years in which to repay the capital, they will be able to let the houses at 4s 6d. a week and there will be no charge on the rates.

THE Worcester City Council recently decided to abandon the system of chemical precipitation which had been sanctioned by the Local Government Board in favour of septic treatment with the aid of Candy-Caink sprinklers, with a view to effecting greater economy and efficiency. The Local Government Board agreed to consider plans for such a scheme, which they ordered should be lodged with them in view of the adjourned proceedings under the mandamus to come on in September. Instructions were given to the Council's engineers, Messrs. Beesley, Son & Nicholls, for the preparation of plans, and the mayor (Alderman C. J. Whitehead), who is chairman of the water and sewerage committee, recently called upon them to inspect the progress of the plans. He was surprised to learn from the engineers that they considered they had received no definite instructions, and that they had prepared plans for the disposal of the city's sewage by means of septic tanks such as are in use at Exeter, which they thought best, and were about to submit them to the Local Government Board. This system the Council had rejected, being in their opinion more costly and less efficient than the system they recommended, and the Mayor immediately communicated to his committee the serious position of affairs, inasmuch as so little time now remains to rectify the error. A perusal of the correspondence with the engineers by the committee left no doubt in the minds of the latter that the instructions to the engineers were quite definite and unmistakable. Instructions were at once sent to the engineers to forward the plans they had prepared, and they are now under the consideration of the committee, who will in all probability place the matter before a special meeting of the Council.

On Sunday night a girder carrying the new Thirlmere water-pipe of the Manchester Corporation over the L. & Y. line at Agecroft collapsed, and blocked both the main lines to Bolton, by which Colne and Accrington are also served. A breakdown gang was hurried to the spot as fast as possible, and the work of clearance went on all night, the Bolton trains being sent round by Bradley Fold and Radcliffe, and those to Colne and Accrington by Bury Hill. Considering the disorganisation which necessarily resulted from the accident, traffic was well maintained and was worked fairly up to time. The girder, which weighed about 17 tons, was in the course of being put in position by the Corporation contractors. It is a big mass of steel, long enough to span the line, and hollow in the centre to allow the great pipe to be carried through it. At either end it

rests on masonry, close beside the old pipe, beyond which is the road bridge. In order to lift the heavy mass into position a large wooden derrick had been erected. This was anchored to the ground on either side by guy ropes, and the girder hung from the derrick. Owing, it is supposed, to the sodden state of the ground, one of the guy ropes gave way. The result was that the derrick heeled over and let the girder down on the permanent way, carrying some of the masonry with it and blocking both up and down lines. No traffic was passing at the time, and no injury was caused to any person. The breakdown gang got to work very soon after the accident, and by half-past eleven on Monday morning the girder was again in position and the debris cleared away. The blocked line is one of the busiest on the Lancashire and Yorkshire system. In addition to the heavy traffic to Bolton and a large part of that to Preston and Blackpool, the line accommodates the Midland expresses from Victoria to Scotland. These had to be reversed at Victoria station and sent round by Radcliffe and Bury.

NEW COURT HOUSE AT HENLEY-IN-ARDEN.

THE new Petty Sessions Court House at Henley-in-Arden, which has been erected at a cost of 2,000*l.* from plans prepared by the Warwickshire county surveyor, was opened on Wednesday by Lord Leigh, Lord-Lieutenant of Warwickshire. Hitherto the magisterial business has been conducted at the White Swan hotel, and in this respect the petty sessional division of Henley has stood unique, as the practice of dispensing justice on licensed premises has long been discontinued in most parts of the country. When the late Queen ascended the throne, and Henley presented a very similar appearance in size and buildings to what the town does now, there was one constable of seventy-five years of age of the name of Walton. Two reverend gentlemen officiated in one of the rooms of the White Swan as justices, and the prisoners before trial were conveyed to the King's Head hotel close by, and fastened by means of chain and lock to an old grate. During the succeeding years the magistrates' roll was increased and proper policemen were stationed in the town, yet the police proceedings were till now always held in the White Swan. The new court house has been erected at the rear of the police-station, which is on the main thoroughfare from Birmingham to Stratford, is an

imposing looking building of red brick, and contains all the modern arrangements for the efficient carrying out of the law. There is a comfortable police-court, a magistrates' retiring-room, police offices, cells and lavatories, and altogether they form a great advance on the old method of procedure.

THE LATE PROFESSOR W. H. CORFIELD.

THE death is announced in the *Times* of yesterday as having taken place on the 26th inst. at Marstrand, Sweden, of Professor William Henry Corfield, sanitary adviser to His Majesty's Office of Works. He was born in 1843, and was educated at Cheltenham Grammar School, Magdalen College, Oxford, University College, London, and the medical schools in Paris and Lyons. Among the appointments which he filled were those of professor of hygiene and public health in University College, London, honorary sanitary adviser to University College and Hospital, president of the Epidemiological Society of London, vice-president of the Sanitary Institute, and past-president of the Society of Medical Officers of Health. In 1868 he was appointed examiner for honours in the Natural Science School, Oxford, and he discovered the existence of lithodromous borings in the Aymestry limestone of the Silurian formation, and "thus removed to an earlier age than had been previously known the evidence of boring bivalves." He was not only the first professor of hygiene appointed in London, but he started the first hygienic laboratory, which was at University College. For six years he was a member of and reporter for the British Association committee on the treatment and utilisation of sewage, and he originated in 1891, the meeting of the International Congress of Hygiene and Demography in London. The Royal Society of Public Medicine in Belgium awarded Professor Corfield a bronze medal in 1901 for his work in connection with public health. For twenty years he was chairman of the committee of the Sunday Society, the object of which is the opening of public museums and libraries on Sundays. In addition to being a member of many foreign scientific societies, he was a prolific author of works connected with public health. Among his publications are a "Résumé of the History of Hygiene," "Dwelling-houses: their Sanitary Construction and Arrangements," "The Laws of Health," "Disease and Defective House Sanitation," which was translated into French, Hungarian and Italian, "The

Etiology of Typhoid Fever and its Prevention," and "Alleged Spontaneous Production of the Poison of Enteric Fever."

THE IRON AND STEEL INSTITUTE.

THE programme has been arranged for the meeting of the members of the Institute at Barrow-in-Furness in the first week of September. The Duke of Devonshire, who is chairman of the Barrow Steel Works and Furness Railways, will receive the visitors at Barrow. Mr. Andrew Carnegie, address, as president, will contrast the conditions of the iron industry in the United Kingdom and America at the present time with what it was at the last meeting of the Institute at Barrow twenty-nine years ago, and endeavour to forecast what the change will be twenty-nine years hence. Mr. Carnegie may also have an invitation to hold the next autumn meeting in America, where they were so magnificently entertained in 1890, and conveyed in special sleeping and dining trains all over the States and through Canada. Mr. J. E. Stead will disclose a discovery he has made which will revolutionise steel manufacture, for he finds that by simply heating dangerously crystalline steel to a certain temperature, however bad the steel may be, he is able to restore it to its normal condition, and even to improve it. The great shipbuilding and other works of the Vickers-Maxim Company, the Barrow Steel Works and the Cumberland Mines will be visited, and all the new features shown to the members, and a most interesting meeting is anticipated.

THE LATE J. A. MACKENZIE, C.E.

ON Saturday night Mr. J. A. Mackenzie, C.E., who was burg surveyor of Inverness for the past twenty-three years, died in that town. He was a genial and public-spirited official, under whose supervision many improvements were carried out, including the laying down of a new sewage system on both sides of the Ness and the consequent purification of the river; the erection of the Waterloo Bridge, a large steel girder structure; the repavement of streets and other useful works. Mr. Mackenzie, who was a son of the late Free Church minister Kilmorack, received his early training as a civil engineer in Inverness, and afterwards acquired experience in America and in England, where he was employed on the Midland Railway.

fore returning to Inverness on his appointment as burgh surveyor. Some time ago Mr. Mackenzie's health gave way, and since then he had not been able to devote himself with his wonted energy to his professional duties, but until the end he took a keen personal interest in structural improvement in the town. His death in his fifty-fourth year was due to heart weakness.

THE BRIDGEWATER TRUST.

OCTOBER 19 will soon be here, and when that date has come and gone the famous Bridgewater Trust will come to an end. The estates which have been administered by the trustees for more than a century will pass to the Earl of Ellesmere, under the will of the famous Duke of Bridgewater. The *Times* has published a very interesting outline of the history of the trust, and incidentally of the development of commerce in Lancashire and other matters in which the Egerton family has taken part. It was the third duke, second son of the first, who was the canal maker; and, as is well known, it was the making of his engagement with the beautiful Duchess of Devonshire that drove him to reside in comparative seclusion on his Lancashire estates, and led him to study the question of canals. In 1759 he sought Parliamentary powers to construct a canal between Worsley and Manchester. Brindley's success in an enterprise which proved more difficult than was at first thought is now a stupendous fact; and hardly was the first canal opened than others, involving even greater engineering difficulties, were put in hand.

But Brindley's genius (as the *Times* points out) again rose superior to all obstacles, and the duke's confidence in him never faltered. It was at this period that the duke's financial resources and credit were almost exhausted. Though he reduced the expenses of his establishment to 400*l.* a year, money was still wanted, and it was only the fruits of his first enterprise that saved him from serious embarrassment. He secured advances on the receipts of the Worsley Canal, and that means was able to carry his second undertaking to a triumphant conclusion. Throughout this period of financial stress he had steadfastly refused to mortgage his estates. If during that period Brindley's remuneration was low, he enjoyed afterwards a fair share of the prosperity he had helped to create. The story that his salary while in the duke's service was only a guinea a week is a myth which,

thanks to Dr. Smiles's improving but misleading work, has gained wide currency. There is evidence that Brindley was in receipt of an adequate emolument. The duke was only thirty-six years old when the great works were completed, and he spent the remainder of his days in improving his canals and estates, and increasing their coal output by his extraordinary system of underground canals with an inclined plane in the rocks between two canals of different levels. They are now some forty miles long, and although no longer used for conveying coal to the surface, still play an important part in draining the collieries. Late in life the duke became an art collector, and acquired many pictures, including three Raphaels and five Titians, for a few hundred pounds. The collection has never been jealously hidden from the public, and is always accessible to real art lovers. The duke, after his first disappointment, remained unmarried, and when he died in 1803 the earldom of Bridgewater passed to a cousin, the higher title lapsing. The duke's canals, his estates in Lancashire and Cheshire, an estate at Brackley, in Northamptonshire, and Bridgewater House, London, with its contents, were devised on trusts under which his nephew, the Marquis of Stafford (afterwards first Duke of Sutherland, whose mother was the duke's sister) became the first beneficiary, and his son, Francis Leveson Gower, and his issue, the second and succeeding beneficiaries. The method adopted by the duke's advisers to extend the duration of the trust as long as possible is likely to remain memorable. Availing themselves of the legal rule that property may be settled for the duration of lives in being and for a further period of twenty-one years, they chose a number of persons and their living issue directly connected with the duke, and added to them the peers who had taken their seats in the House of Lords on or before the duke's decease on March 8, 1803. This proved to be an unnecessary extension, as the last of the peers died in 1857, while one of the commoners lived until October 19, 1883; indeed, several members of one family selected, the Vernon Harcourts (uncles and aunts of Sir William Vernon Harcourt), surpassed the peers in longevity, and curiously enough the last survivor of the named lives was not born at the time of the duke's decease, but some six months afterwards, coming, however, within the description, as in the eye of the law he was in being when the duke died.

As the *Times* further points out, it has been necessary to establish the death of all the persons named, including 359 peers—lay, spiritual and representative—who composed the

Excelsior and Rawdon Potteries,

Upper House of Parliament for the session 1802-3. The proving of the deaths of so many persons, even if peers, was a difficult task, more especially from the fact that, of the lay peerages, no fewer than forty-nine became extinct on the deaths of the possessors. Finally all were disposed of as a matter of evidence with the exception of two, of whose deaths, however, there is abundant indirect evidence. The will of the duke is almost as remarkable as his other achievements. It fills sixty-six pages of printed matter, and contains the most minute directions for the administration of the estates under the control of a superintendent trustee, endowed with ample powers. The revenues were to be enjoyed during the existence of the trust by the Marquis of Stafford, and then by his second son, Lord Francis Leveson Gower and his issue. An interesting provision in the will was that, in the event of Lord Francis or his issue succeeding to the Marquisate of Stafford, the revenues of the Bridgewater estates should pass to the next in succession.

The object of the formation of the trust was, in the words of the duke, as set forth in the will:—

"As far as the rules of law and equity will permit by the means adopted in this my will to suspend the right to the inheritance of my trust estates for the purpose of keeping my said canal and the trade thereof, together with the estates annexed thereto, as one joint fund, under such control, superintendence and management thereof as aforesaid, to the intent that the public may reap from the same those advantages which I hope and trust the plan adopted in my will is calculated to produce for their benefit."

Thus was founded the trust which for so long has played a prominent part in the history of Lancashire, and the influence of which has been felt all over the country. Though it has been long in existence, the memory of the duke and the impress made by his character have not altogether faded, and to this day persons employed on the estates speak of working at the "Duke's," while the products of the collieries are still known as "Duke's coal."

Into many of the ramifications of the *Times* article space will not allow us to enter; they are almost as bewildering as a Bridgewater tunnel to a stranger, but it is interesting to note that the effect of the splendid canal service was to reduce the price of coal in Manchester by one-half, while even in the midst of success the duke was shrewd enough to see danger in the rivalry of "those d— tramroads." Railway communication, however, was slow in developing, and as late as

1860 "swift packets" plied between Worsley, Patricroft, Barton and Manchester, carrying passengers at lower rates than they are even now conveyed by the railway. Communication with water with Liverpool was also maintained until about 1860, and "swift packets" on the canals ran in connection with the steamers on the Mersey. Keener and Keener became the Parliamentary struggle with the railways; the trustees fought 170 battles in the committee-rooms, and only four times were they vanquished. All this was done without crippling the trust property. And ultimately some forty years ago the railway and the canal to a great extent joined forces, and ultimately the canals were transferred to the Bridgewater Navigation Company. In 1887 the Manchester Ship Canal Company bought the canals.

The beneficent rule of Lord and Lady Francis Egerton is sympathetically sketched in the *Times* article, which concludes:—"The present Earl of Ellesmere on attaining a majority became the beneficiary, and will succeed to the unfettered ownership of the property on the expiration of the trust. It will make no difference to him in income or wealth, but the absurd rumours that have obtained some currency as to his accession to fabulous fortune are understood to have made him an object of much solicitude and assiduous attention on the part of many of those who are ambitious of disposing of other people's money in charity or other ways. He has been very successful as a breeder of horses, and has always been keenly interested in 'the sport of kings,' while at the same time he has maintained the traditions of his family and firmly recognised in his grandfather's words, 'the duties that devolved upon him with his inheritance,' though the ample benevolence of his predecessors leaves him less prominence in this field."

NEW FIRE STATION FOR SALFORD.

A new fire station which has been erected in Albion Place, Salford, is now ready for occupation, and is a marked improvement on the brigade's old quarters. Planned by Mr. Hey Kirkley, of Manchester, the new building embodies the results of a wide investigation of the fire stations of the larger towns of England, Ireland and Scotland, carried out by Mr. Alvan Shaw and members of his committee, assisted by Mr. Bentley, the chief officer of the brigade. The building faces north and south, the front portion directly overlooking the City.

ent. In the middle and facing the Crescent is the central block containing the main engine-house, a duty-room, callroom and a large tower 52 feet high for drying the hose after use. Adjoining this block, and on the left of it, is a commodious dwelling for the use of the chief officer. To the right of the engine-house block, but separated from it by the main entrance, are a large workshop, smithy, loose-box stabling and a spare machine-house, whilst on the corresponding side, and behind the chief officer's quarters, is the drying-room, as well as another machine-house. Behind the front block and flanking a large exercising ground are two rows of cottages for married firemen, each of which contains three good-sized rooms, three bedrooms and a scullery and bath. Room has also been left for an additional block of similar dwellings, should the increase of the brigade necessitate more housing accommodation.

The main engine-room is 69 feet long, 35 feet wide and 25 feet high, and will accommodate five machines, which will stand directly in front of the large doors, whilst the stalls in the engine-room are so arranged as to be directly behind the engine, with a direct run from stable to engine. The electric callroom and duty-room, which are separated only by a glass partition, are on the right of the engine-room, and allow of complete supervision from the chief officer's room. This last is an office 12 feet by 13 feet, and communicates directly with the engine-room and also with the chief officer's dwelling. On the first floor over the engine-room is a large parade and instruction-room, as well as the single men's quarters. Over the duty and call-room is a capital recreation-room, where billiards and other games may be played, and there are on the same floor lavatories and bathrooms for the use of the men. To facilitate the work of the brigade when a call is received there are two sliding poles connecting the parade-room on the first floor with the engine-room below, two others connecting the recreation-room with the duty-room, and one from the chief officer's bedroom to his office below. The brigade at present consists of chief officer, sixteen married men, and about six single men, and the appliances include one steamer, a chemical engine, two horse tenders and a horse escape.

While the station contains little that is not found in one or other of modern fire stations, it is claimed that it goes far to embody all their merits. There is, however, one new feature, the form of a horse-bath, introduced by Mr. Bentley himself. It is found that valuable horses are often lost after severe exertion because they catch a chill. This the bath, which can be heated to any degree, will, it is hoped, prevent.

NEW DOCKYARD AT GIBRALTAR.

A SPECIAL correspondent of the *Standard* has described the new works at Gibraltar:—

The South Mole has been extended for a distance of 2,700 feet; a new detached mole opposite to the King's Bastion, 2,720 feet long, is being completed, and the Commercial Mole is being extended towards the latter, with a wharfage of 9,348 feet, thus enclosing about 440 acres of water, of which 250 acres will have a minimum depth of 30 feet at low water, with two openings capable of being closed against torpedo attack. Within the harbour, and in the angle between the South Mole and the shore, three dry docks, respectively 850 feet, 550 feet and 450 feet long, are being constructed, the largest of them capable of division into two docks by means of a sliding steel caisson. Gibraltar is also to be raised to the rank of a dockyard capable of executing the most important repairs, and accordingly, extending northward from the docks to the Ragged Staff, a whole range of necessary works is being erected, including buildings for constructors, machine shops, engine and pumping houses, stores, a torpedo establishment, tanks, slipways and magazines. A considerable reclamation of land became necessary, 47 acres being recovered from the sea, while 215 acres have been dredged to a minimum depth of 30 feet, and the total amount of money estimated to be spent upon all these works up to the end of the financial year 1904-5 is 5,812,000l.

The transformation that has been made is truly wonderful, and there are certainly no such interesting and varied constructive operations in progress anywhere else in the world. Practically a new dockyard has been created, involving many different classes of work, temporary and permanent, including breakwaters, docks, quays, torpedo slipways, retaining walls and dams for displacing the sea and reclaiming the land, dredging, blasting, quarrying, tunnelling, bridgework, railway construction, concrete-block making, dockyard buildings, drainage, water supply, lighting, &c. Sir Henry Pilkington, K.C.B., is the civil engineer-in-chief at the Admiralty, and the whole of the Gibraltar works are under control of Mr. A. Scott, M.Inst.C.E., Admiralty superintending civil engineer. Messrs. Topham, Jones & Railton, of London, are the contractors. More substantial and magnificent masonry it is impossible to conceive. Local limestone has been largely used, with stone from Peñarubia and other Spanish quarries, while granite has been

brought from Aberdeen, Norway and Italy, the import amounting to between two and three million cubic feet. The Rock itself has supplied already over 3½ millions of tons of stone, sand and rough material for filling.

The blockmaking works upon the North Front are on a very extensive scale, blocks being made up to 40 tons, and there are Titan cranes and other lifting gear, with railways and barges for transport to any required point. It will afford some idea of the gigantic character of the work if I say that 13,127 blocks have been used for the extension of the South Mole, 8,268 in building the detached mole, and 62,000 for the various quays, &c., of the Commercial Mole. The Admiralty range of new coal-sheds has a length of 2,000 feet, while the new sheds on the Commercial Mole will be 3,175 feet long. A "coaling island" upon piles is also progressing in the harbour.

The docks are the most important of the works, and the smallest of the three, known as the King Edward VII. Dock, His Majesty having laid the coping-stone on April 9, 1903, will soon be ready for use. The steel sliding caisson for closing the entrance is now being erected. The other docks are less advanced, but are taking shape, and work proceeds energetically day and night so that they may be completed within the appointed time. The pumping-house is a marvel of efficiency, and contains the main pumping-engines, drainage-pumps and engines, and accumulators for hydraulic pressure. So powerful is the apparatus that the large dock will be capable of being emptied in 5 hours, this being equal to 105,000 tons of water, or 4,700,000 gallons an hour. The dockyard stores, buildings and offices are being erected upon piles, and the latest machinery and appliances will be supplied. The buildings cover an area of about 11 acres.

The policy pursued by the Admiralty in creating a new Gibraltar should command the approval of all Englishmen. The increase in number and size of the ships composing the Mediterranean Fleet has overtaxed the accommodation of Malta, and it is not improbable that the Western port may yet become the headquarters of the Cruiser Squadron. Battleships, cruisers and destroyers will find there all that is necessary for their life and service. Damaged in action, or disabled by accidents, in need of docking for under-water repairs, requiring coal or naval victualling stores of all kinds—whatever may be their class, they will find all they want at Gibraltar. Regarded, indeed, from every point of view, the great dockyard and harbour of the Western gate of the Mediterranean is a supremely important link in the chain of naval preparedness.

All the world knows that Gibraltar is magnificently defended by its guns, and a great magazine is now being dug in the very heart of the Rock.

ELECTRIC LIGHTING IN DUBLIN.

A REPORT of the electric-lighting committee of Dublin Corporation, to be submitted to a special meeting of the Council next week, sets out extra expenditure in connection with the new electric lighting system, to cover which the committee recommend that an application for a loan should be made to the Local Government Board. The committee submit a report from Mr. Robert Hammond setting out the items of extra expenditure incurred in connection with the complete system. The total amount of this is 48,000*l.* in respect of the city undertaking in addition to a sum of 5,961*l.* expended in the city under the Clontarf electric lighting scheme. The report goes on to deal with unforeseen difficulties which were met with, especially in the laying of street mains (the latter owing to the extraordinary number of old cellars which run out under many of the streets).

The report of Mr. Hammond, dated July 28, sets out the liabilities amounting to 302,500*l.* or 48,000*l.* beyond the 250,500*l.* loan sanctioned by the Local Government Board, but then incurred, in addition to the 5,961*l.* specified above. It then gives in detail the items making up this extra expenditure of 48,000*l.* They include:—Iron troughing for the mains, substituted for earthenware troughing included in my scheme, 6,000*l.*; extension of engine-house to provide space for additional plant and Lancashire boiler, 4,261*l.*; substitution of Lancashire boiler for water-tube (extra seatings), 500*l.*; coal steers and provision for mechanical coaling and ash disposal, 5,921*l.* less provision in original estimate, 1,600*l.*, 4,321*l.*; lowering gear for arc lamps, 1,400*l.*; culvert at Victoria Bridge, 2,700*l.* No provision, Mr. Hammond states, was made for this, but the consulting engineer understood that cables would be taken through culvert to be constructed in connection with the main drainage. Storing plant in consequence of delay in starting work in Pigeon House, 781*l.*; expenditure at Pigeon House on extra well, pipes, foundations, &c., 1,250*l.*; extra cost of constructing Sackville Street sub-station, underground, 44,000*l.*; extra sub-station at Trinity College, 575*l.*; Trinity College transformers, 514*l.* 16*s.*; removal of Thomas Street sub-station,

52*l*.; additional mains in present area, 2,37*0**l*.; sundries, including new design of brackets for arc lamp-posts in present area, for which price is under discussion with the contractors, 500*l*.; demand indicators, 2,000*l*.; small meters, 500*l*.; expenditure in Dublin on preliminary expenses, legal expenses, contract charges, stamps, printing, clerk of works, water supply, &c., 3,000*l*.

The amount of contracts entered into in connection with the undertaking is as follows:—Total of contracts entered into up to February 7, 1903, 250,366*l*. Until complete measurements are made and agreed with the contractors, it is not possible, says Mr. Hammond, to deal with the exact figures; but subject to this proviso, I beg to submit the following statements:—Estimated cost of additions to building work at Geon House, including provision for Clontarf lighting already reported to Council, 5,106*l*.; additions to building work at Geon House not yet reported to Council, 1,259*l*. 1*0*s. 3*4*d.; additional substations and of additional work in connection with those contracted for originally, 2,139*l*. 14*0*s.; additional mains and additional work, including provision for Clontarf, 1,602*l*. 17*0*s. 9*4*d.; increasing the section of mains in certain streets and alterations to cellars, &c., 10,331*l*.; sundry extras and contracts not included in the remaining lists, 3,534*l*. 8*0*s.; total contracts entered into and reported on on February 7, 1903, 250,336*l*. The extra expenditure to be allocated as follows:—To city lighting, 48,000*l*.; to Clontarf lighting, 5,961*l*.

The lighting committee say they have very carefully considered the items of Mr. Hammond's statement and recommend them for the approval of Council, and recommend further, that application be made to the Local Government Board for its sanction to a supplemental loan of 48,000*l*.

THE WORKING OF SYNDICATES.

THE British Consul-General, Mr. Francis Oppenheimer, in his latest report to the Foreign Office on the trade and commerce of Frankfurt-on-Main, says that as much uncertainty prevails concerning syndicates, the German Government have appointed a commission to inquire into the subject.

The task, he says, will not be an easy one, as the number of syndicates ascertained to exist during 1901 and 1902 amounted to 450. The inquiry can only be extended to the most characteristic types, which will be grouped under the headings of mining and iron industry, chemical industry, paper industry,

agricultural industry, finally the stone, earth and glass industry. The inquiry is to establish:—The numbers of membership of the syndicates; the number of their workmen; the character of their produce; quantity and value of their produce per annum; the causes leading to their foundation; their purposes and organisations; the means (and their consequent success) by which they pushed their sales at home and abroad; the prices obtained at home and abroad, and the causes of their difference of price (if any); the influence, if any, exercised upon dependent industries and merchants by their conditions of sale; their success in influencing the prices of raw materials and semi-finished goods requisite for the manufacture of the "syndicated" produce; the influence, if any, which they had upon workmen and wages in the syndicated concerns and the finishing traffic. Shortly, the inquiry is to pay special attention to:—(1) The number and species of existing syndicates; (2) the price policy of the syndicates; (3) the effects of syndicates and the means used for attaining their ends.

The result of this inquiry will no doubt confirm many of the benefits and disadvantages claimed for and against syndicates by theorists. There seems a general consensus of opinion that since the foundation of syndicates the old adage that "competition is the life of trade" no longer applies. Syndicates practically do away with competition, which had led to technical improvements and inventions. As syndicates take in tow also weak concerns, natural selection among the works of the same branch ceases. It has not yet been proved that this is counter-balanced by the endeavours of the various members of the syndicates to occupy a prominent position in the same. Syndicates, moreover, will endeavour to rule the market. This compels them to deal very summarily with any new competition that may spring up outside. Outsiders are fought with every conceivable means; they are underbid; their sellers and buyers are boycotted, and some of the steps taken by syndicates have led to litigation in the courts of law. Syndicates also interrupt all connection between manufacturer and customer, which is one of the causes of their strength, for all individual connection having been severed, the manufacturer, if he quitted the syndicate, would find himself compelled to begin all over again.

All agree that, since the formation of syndicates the capitals invested in trade have become less subject to risks arising from crises; prices remain more even and steady; the crumbling away of prices through underbidding—especially in times of receding trade—is no longer feared, and the expenses of pro-

duction are reduced. Thus also the labour market must profit; employment and wages have become steadier; if during bad times the home prices are kept up artificially, wholesale dismissals of workmen need not be resorted to; the various trades will more easily acquire an old and experienced stock of workmen.

Whatever advantages or disadvantages individual syndicates may cause to the producer, the public and the workmen, it must not be forgotten that it is the tendency of syndicates to call into existence other syndicates—whether it be in support or in opposition—and thus the advantages or disadvantages become multiplied over the country. Concerning all this, the above-mentioned commission will no doubt furnish the Government with much valuable information; and the information will be all the more welcome as the time must come when the Government will be forced, actively and prominently, to participate in syndicates.

Though the Government owns coal mines within the geographical limits of the Rhenish-Westphalian Coal Syndicate, it has so far stood aloof, because its participation there in the production of coal is as yet insufficient to give it a leading voice. A Bill has been brought in empowering the Government to acquire additional coal mines, and it is hoped that some day the Government possession of coal mines and their output may be made sufficiently important to establish a "fiscal coal cartel;" that is to say, a coal syndicate in which the Government will be able to dictate terms.

One such fiscal cartel indeed already exists, viz. in the rock salt industry, and it is claimed that it offers all the advantages of a Government monopoly without its disadvantages.

From time to time complaints are raised in the German Press against the German syndicates generally, or some special syndicate, and a Government interference is demanded. The "extremists" demand direct legislative interference, a suggestion which finds little favour with the public; others claim but a Government supervision, which would enable an insight into the contracts and books of syndicates; others wish to introduce into the new customs legislation a provision enabling the Bundesrath to suspend or diminish from time to time the customs duty on such goods which, by a combined action of sellers, are artificially raised or maintained high in price. A suggestion, based upon the American practice of refunding the customs duty upon goods which, after having been imported for finishing are again exported, finds but little favour, as the official control of such goods would entail a greatly increased

staff of officials, and the system itself so easily leads to a veiled system of private export premium.

So far the only concession made by the Government in reply to such claims is the appointment of the commission above referred to—a step undoubtedly accelerated, if not altogether prompted, by the circular published by the Russian Minister of Finance, in which he suggested an international conference to deliberate upon the commercial situation created by the price policy of the syndicates on the world's market. This document certainly raised the loudest alarm as yet raised against the syndicates by pointing out that fair trade on the world's market was at stake, more especially since various syndicates in different countries had arrived at an international understanding, and that when shortly new commercial treaties would be under negotiation all over Europe, the proper occasion would present itself for an international exchange of opinion. It also pointed out that an international conference would be but a further step in that same international policy which had been entered upon by the Brussels Conference, which had internationally regulated the national export bounties upon sugar.

The question of syndicates has certainly acquired international importance; leading German trade papers admit it boastfully, as one of the most widely circulated said not so long ago:—"It cannot be denied that the large commercial concerns have shown apparent indifference during these times of politico-commercial agitation. Such indifference can only be explained by the fact that these large concerns no longer attribute to the customs policy its former importance; it cannot be denied that the protection offered by syndicates is continually being more appreciated, and that the commercial concerns are generally of opinion that the syndicates offer to industry a protection which robs the customs duty of that force which it has so long enjoyed. The commercial policy alone is no longer decisive for the prosperity of a trade; the policy of syndicates has become a most important item of commercial development."

Such a statement, when put forward by those most competent to judge, must imply international agreements among syndicates, which if carried to their full length might in the end render superfluous any national commercial policy. Such glances into the future cannot appear altogether fantastical, as there already exists a certain number of such private international understandings, but it is hardly likely that such considerations will enter into the deliberations which will bring about the next set of commercial treaties.

ARMOURRED FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London."

Officially Endorsed by the
Fire Offices Committee.

Lighter and Cheaper than
Iron Doors.

And at Glasgow, Leeds, Birmingham, &c.

The Architect.

THE WEEK.

The inaugural lecture of the new session of the School of Architecture, University College, London, will be delivered by Professor F. M. SIMPSON on October 7. The subject will be "Architectural Evolution." There will be three terms in the session, the first beginning on October 6. The college certificate will be granted to students who have passed the special matriculation examination or some other examination (such as the London University matriculation) accepted in lieu of it, have presented certificates of attendance in three of the subjects mentioned under "first year," and have satisfactorily passed through the full architectural course of three years. Students not wishing to go through the certificate course can take merely the architectural and drawing from the antique classes, devoting the whole of their time to these. The lectures will relate to building construction and design, and the history of architectural development. Students can join either course without attending the studio classes. A course will also be delivered by the Professor of Mechanical Engineering dealing with iron and steel construction in buildings (roofs, girders, stanchions, &c.) and laboratory tests on cement, bricks, stones, concrete, timber, iron, steel, &c. In addition there will be classes for instruction in working drawings, building construction, measuring and estimating.

THE Brighton Grand Aquarium has ceased to be a novelty. It now belongs to the Corporation. But the money which is required to realise Mr. TILTMAN'S plans is not forthcoming. An ordinary speculator would see the necessity of a change, but the councillors are without experience in working places of entertainment. By the irony of fate a building which stands in need of rebuilding has been selected as the place for an exhibition of building improvements and decorative art from September 23 to October 10. Preceding exhibitions in the Aquarium have succeeded. According to the prospectus, "It is the desire of the committee to organise an exhibition of all those things which are novel and attractive in the building world, giving due prominence to artistic, decorative and modern improvements (rather than to ordinary and staple articles of utility long since recognised). At the same time exhibits of historical interest and those illustrative of the progress of British architecture will be welcomed." Brighton possesses a great many architects, most of whom are members of the consultative committee. It cannot be denied that a large amount of money is expended every year on buildings, for London enlarges, its marine satellite must keep pace with it. It may be mentioned that the Aquarium committee, having decided to introduce a new heating system in the building, offer a special prize of twenty guineas for the best proposal, to be accompanied by plans and estimates, with or without illustrative working models, the cost not to exceed 600*l.*, under the conditions more fully set out on forms to be obtained from the manager.

SINCE trade has of late almost become omnipotent, it is exerting its power in novel ways. We pride ourselves on our peculiar system of weights and measures, but foreign merchants derive a part of their strategy from its inconvenience, or, what comes nearer to them, its dishonesty. For example, about thirty Chambers of Commerce in Germany entered a protest against the English pound weight, which they say is equivalent to only 454 grammes, as against 500 grammes under the decimal system, so that the dealers as well as the makers are damaged, inasmuch as the former expect and the latter actually furnish 500 grammes, while the foreign manufacturers, who can offer their shorter and cheaper prices, are unfairly benefited. It is to be expected in consequence of the agitation that sooner or later British manufacturers will have to supply the market with packets complying with the decimal system. Otherwise they will be put out of the competition. The Americans, meanwhile, with their customary shrewdness, are adapting themselves to countries where the decimal system prevails as well as Great Britain.

This concession gains favour in decimal-loving countries because it is supposed that the United States desire to be emancipated from English weights and measures. It is remarkable, however, that the metre, which is the best known representative of decimalism, is not finding favour with many scientific men in France. It is assumed to be the ten-millionth part of the distance from the equator to the North Pole, as ascertained by actual measurement of an arc of the meridian. Although great mathematicians like DELAMBRE and BIOT superintended the calculations, the instruments of which they made use, and which were provided by the Constituent Assembly, were too clumsy to allow of more than an approximation to exactitude. If considered in relation to a meridian, the metre is found to be too short. It is, therefore, an impostor which has obtained recognition under false pretences, and one, moreover, which is likely to have caused great error in all astronomical or terrestrial calculations of which it was a unit. A new metre is proposed as a substitute, and this is based upon the medium height of a barometric column at the sea-level. In that way the metre would be increased by 0.033. Of course, it could only be considered as temporary, for the atmospheric pressure varies, but it would at least serve better than the existing metre for some millions of years.

So many accounts have appeared in newspapers describing the facility with which Americans raise, lower or transport their buildings to a distance, there is a belief in other countries that they can be imitated. In Switzerland especially, where there are so many timber-framed houses, it is almost natural that the idea should gain a firm hold on the people. A catastrophe which has occurred in Amriswyl, in the canton of Thurgau, and close to the Lake of Constance, has demonstrated that more skill is required for safely conducting those experiments than is found in all places. A shopkeeper desired to raise his house about 10 feet in order to provide additional accommodation. A master-builder from St. Gall was entrusted with the work. Baulks of timber were introduced in the basement, and having secured a timber foundation the elevation commenced. It was so slowly and equally carried on as to be hardly perceptible to the occupants. An elevation of about 9 feet had been obtained, and practically not more than a foot remained to complete the operation. Care had been exercised to shore the sides of the house in order that it might be kept in a vertical position. Through a heavy fall of rain the ground became soddened. Some of the raking shores in consequence sank. The building inclined, and then suddenly collapsed by heeling over on one side. An assistant of the owner and the building inspector were killed and others were injured; a heap of *débris* represents the house.

AT one time busts of Roman emperors were considered desirable accessories for palatial mansions in England. But although much has been said and written about these rulers, there has been no public recognition of them in this country. The Emperor of GERMANY, who is nothing if not original, has decided that their connection with Germany should be manifested in a way which cannot be ignored. He has started by giving commissions to Herr GOTZ, the sculptor, for figures of HADRIAN and ALEXANDER SEVERUS, which are to be placed in the Saalburg, the re-created Roman castle which two years ago was converted into a museum, and is suggestive of the hill forts erected for the protection of the great line of Roman fortifications. A colossal figure of ancient Germany in a different part of the district is another memorial of the great contest between two races. The heads of the two emperors are modelled after antique busts. HADRIAN stands with his right arm uplifted and holding a lance. ALEXANDER SEVERUS is represented as very young, for he was murdered in his twenty-seventh year. With his left hand he appears grasping the hilt of his short sword. Both are to be cast in bronze, and will be larger than life-size. HADRIAN was acquainted with Britain. He constructed a rampart in the North of England, but it was little used after the more important masonry wall was constructed by SEPTIMIUS SEVERUS. The two statues, we suppose, are only the beginning of an imperial series.

A RENAISSANCE CRITIC AND BLACKMAILER.

THE Renaissance period is supposed to be a great endeavour to attain a standard which was almost of an ideal kind, viz. the production of works of art and literature equalling those of antiquity. But as at all times human weakness appears, many of those who took part in the struggle were not as sincere or as competent as they professed. Hence there arose an opportunity for satire to point out abuses and frailties. There was generally a fear of disclosures, and writers who could become libellous were either honoured and bribed or put out of the world. We may mention three cases of the former variety, viz. ERASMUS, who was born in 1467, PIETRO ARETINO, who was born in 1492, and RABELAIS, who was born in 1495. They represented the most civilised parts of the Continent, where the power of the Renaissance was most at work. Popes, emperors, kings and princes were anxious to conciliate them. Although the Church, the universities and civil governments would have gladly adopted some means to prevent those men from writing books, they were able to survive all efforts against them. Each could have attained an exalted position, and all of them died as quietly as any ordinary citizen of the period. We do not intend to follow out those remarkable lives or to explain what correspondence in character existed between them. We propose simply to glance at the career of PIETRO ARETINO, the most discreditable of all, because he was connected with great and petty artists, and as far as he could he endeavoured to victimise them.

He was the illegitimate son of a cobbler of Arezzo and was early thrown on his own resources. He received little education except from the books he assisted in binding, which was his first employment in Perugia. Then he went to Rome and found patrons. He became also a friend of artists. He might have succeeded in that city if it were not for his co-operation in a production which even in those lax days was considered immoral. A set of plates engraved by MARC ANTONIO from designs by GIULIO ROMANO appeared, and they were accompanied by sonnets of ARETINO. Whether the verses originated the plates or *vice versa* is unknown; but the engraver was cast into prison, GIULIO fled to Mantua, and ARETINO escaped to Florence and finally to Venice.

He could write prose as well as verse, and was an adept in most forms of composition. His comedies, according to HALLAM, are reminiscent of Athens rather than of Rome, for they showed more of the effrontery of ARISTOPHANES than the pleasant freedom of PLAUTUS. According to the historian:—"In a literary sense the writings of ARETINO are unequal: the serious are for the most part reckoned wearisome and prosaic; in his satires a poignancy and spirit, it is said, frequently breaks out; and though his popularity, like that of most satirists, was chiefly founded on the ill-nature of mankind, he gratified this with a neatness and point of expression which those who care nothing for the satire might admire." With all his cleverness he was likely to have failed if he followed the ordinary course of legitimate authorship. But, like the man in the "Vicar of Wakefield," he gained money by offering to dedicate one of his writings to any patron who paid for the distinction, and he accepted compensation for the omission of names or anecdotes from his pages. He seems to have possessed an unlimited capacity for accepting bribes or presents of all kinds. Venice was a commercial city, and we presume the merchants around allowed him similar latitude in selling his wares to that which they insisted on for themselves. Venice at this time was a centre not only of trade, but of diplomacy, and it was easy for ARETINO to manœuvre in such a way that apprehensions of his libels were excited in remote courts. Not even HENRY VIII., with all his bluff courage, was able to escape paying a price for exemption. When ARETINO called himself the scourge of princes, there was more truth in the phrase than in many others which he set down.

He was not always the satirical rogue, or it may be he was only ridiculing his subjects still more when he attempted to write on the most sacred themes. He saw Italian painters around him who could alternately take up Pagan and Christian legends. There was then little consistency among artists or authors. One effect of his devotional writings was to win some regard from a Pope, for JULIUS III. embraced him as if he were a pillar of the

Church. It is also remarkable that he sometimes became the severe moralist when judging paintings. From an early age it was customary to introduce portraits of the people who gave commissions as auxiliaries in Scriptural or ecclesiastical pieces. But in ARETINO's time in Venice there appeared to be no limit to the intrusion. Out of the five figures in TITIAN'S *Supper at Emmaus*, now in the Louvre, four are known to be portraits. In the glorious *Wedding at Cana* by PAUL VERONESE, in the same gallery, several artists are represented. ARETINO denounced the practice, and with good reason, but he was near suffering his temerity. TINTORETTO, who had been dismissed from TITIAN for his refractory character, and who, according to VASARI, possessed the most determined hand with the boldest, most extravagant and obstinate brain of any artist in Venice, made a pretence of preparing to pistol the critic, and that was sufficient to scare ARETINO. On another occasion he reproved the medallists of Italy for degrading their art by making portraits of nobodies, which, he declared, should be restricted to notabilities. As often happens with censors, the law he laid down for others he never thought of obeying in his own practice.

We can obtain a glimpse of the respect in which ARETINO was professed to be held by some of his great contemporaries from letters which have survived. The Marquis FREDERIC of Mantua in 1529, addressing himself to the magnificent and most learned signor, tells him of the pleasure his letter gave, because it revealed that ARETINO was inspired by affection. The duke said he wished to recognise him as the dearest of all his friends, and he was resolved to do everything necessary for his success at profit. There was a famous portrait of PETRARCH'S LAURENCE by SIMON MEMMI which, it is evident, ARETINO demanded. The duke declares he has not been able to find it, but when he does it is to be at ARETINO's service. The scribbler sent an engraved gem by VALERIO to the duke, which the duke promised to faithfully preserve among the most cherished objects he possessed, and for the sake of the satire he consented to patronise the engraver. ARETINO evidently took care to have two strings to his bow. He would write to a patron for an example of a painter's work, and he would also write to the artist making a similar request. If one failed to bring him what he sought, he was sure to succeed with the other. GIULIO ROMANO was then employed in Mantua, and ARETINO wrote to the Bolognese Prince CARLO, a relative of the duke, begging for the design which the artist had prepared. GIULIO apparently was too busy and had not despatched it. But the grandee sent a picture of DIANA instead, and at the same time informed ARETINO that he has only to send orders and it will afford him great pleasure to carry them out.

We have a letter of another kind from SEBASTIAN DEL PIOMBO, the friend of MICHEL ANGELO, by whom he is said to have been aided in order that he might become a rival of RAPHAEL. In Venice he was one of ARETINO's best companions, but Pope CLEMENT gave him the appointment of Keeper of the Leaden Seal. Whenever he witnessed the stamping of the papal bulls it was necessary for him to wear a monk's robe. The painter writes to his friend in Venice that he was no longer the good fellow of former days, but he had become FRA DEL PIOMBO, and he bids him inform SANSOVINO, who was an angler, that leaden seals, red tape and other offices were to be fished for, whilst in Venice he caught only eels and gudgeons. Another artist, LEONARDO BARTOLINI, a sculptor, writes to say how much he has been pleased by ARETINO's contrast between the gates of Heaven and those of Florence. On one was inscribed "All he who abandon ye who enter," while on the other it was "Abandon hope all ye who go out," and he announced how he and his friends desire to make ARETINO patriarch of the Temple of Solomon.

Among the most characteristic of ARETINO's epistles is one he wrote to MICHEL ANGELO on hearing about a commission for the *Last Judgment* in the Sistine Chapel. He begins by affirming that, as a man would be worthless who was forgetful of the Deity, so it would be to despise knowledge and fail in judgment if one did not venerate a great artist on whom Heaven had poured all its graces and favours. He dared to address him because he (ARETINO) had already acquired more or less celebrity among princes by his courage in bestowing blame as well as praise.

though the world might have many kings, there was only single MICHEL ANGELO, who was one of the most perfect creations of nature, and imparted to his works not only the grandeur and majesty derived from nature, but the power and style which were his own. No one who had seen MICHEL ANGELO need regret they had not looked upon PHIDIAS, APOLLO and VITRUVIUS, for their genius was only the shadow of the Florentine artist's. It was, indeed, fortunate for the reputation of PARRHASIUS and the other great masters of antiquity that their works had not come down to us, for the artists themselves would recognise the inferiority of what they did, and would declare MICHEL ANGELO to be the unique painter, the unique sculptor and the unique architect among men. Then ARETINO gave an imaginary description of the artist's last Judgment, and it must be owned there is vigour in the sentences and a knowledge of BUONAROTTI's terrible manner. He added that people would tremble on seeing just as much as they would on the Last Day. It has been suggested that ARETINO in anticipating the future should be able to announce that he had given MICHEL ANGELO inspiration for his masterpiece.

The artist had then so many enemies, he probably concluded it would not be wise to have so unscrupulous a stretch added to them. His reply is laudatory, but could hardly be otherwise than insincere. He tells the magnificent signor, whom he calls a brother, that his letter caused him at once joy and sorrow. Joy at receiving such a testimonial from the only model of knowledge that existed, and sorrow that he could not utilise so much imagination, for the design had been completed for a part of the work. There must have been sarcasm in the suggestion that ARETINO would make known his opinions of his merit, since both kings and emperors considered it one of the greatest favours to have their names written with ARETINO's pen. The true meaning of his flatterer's epistle is expressed by the artist when he said:—"If I have anything which can afford you pleasure, I offer it to you with all my heart." In other words, MICHEL ANGELO was willing to be blackmailed by surrendering some design, picture or model. Whether he carried out his intention is unknown. It afterwards ARETINO, posing as the champion of Christianity, roundly abused the artist for the indecency of painting and the introduction of Pagan figures.

Poor GIULIO ROMANO must have been dilatory in attending to ARETINO's behests, for he excuses himself on the ground that he is suffering such torture with his eyes he was hardly able to make his Easter Communion. The Duke and Duchess of MANTUA were so exigent, it was with difficulty he was able to obtain an hour to prepare a drawing he sent with the letter; he admitted it was not good in composition, and it was the first time he made a drawing with a pen, but he was willing to do anything with his feeble forces could accomplish in order to please a friend, by whom he hoped to be pardoned for being slow and negligent. Perhaps the best evidence of the impotence of ARETINO is to be found in an appeal from a poor painter and engraver, FRANCESCO TERZO, of Bergamo, whose name is unrecorded in any history of Italian art. He begins by apologising for the meanness of his present, and says the cause is the avarice and ignorance of rich people who keep down men of talent. It is in vain for a man to go through a thousand fatigues in order to acquire an art, and then to give proofs of his capacity. The difficulty remains of discovering patrons. Where would MICHEL ANGELO be if the pen of ARETINO had not made the triumph of his work? Wanting that aid he, TERZO, had difficulty in obtaining even bread. But if poor in goods he was rich in talent. All he was able to send was the portrait of a honest girl, but she was of a humble class, and in her that her position might not be recognised he had represented her wearing clothes unlike her own. But ARETINO could dispose in any way he liked of such ability the painter possessed. The letter reveals how the fame of MICHEL ANGELO was spread among all classes of artists. It was needed he was the arbiter of taste for Europe, and it was necessary to have his good word in order to attain fortune and fortune.

What a wonderful collection must ARETINO have accumulated. From MICHEL ANGELO to TERZO there were every varieties of artists, and they were all likely to have

contributed to his booty. When the GONCOURTS visited the small house of THÉOPHILE GAUTIER they were amazed when they saw only a few trifling sketches which expressed the gratitude of painters to the most eloquent of all Parisian art critics. GAUTIER did not make any complaint; he was an honest man, he loved art and was gratified when, by his words, he was able to make the way easier to success for artists of ability. Fortunately a similar rule is adopted in England. There are worthless artists who say they have not gained commissions because they were unable to pay the price for favourable notices in journals. Although the pen is still as powerful as ever, there are no ARETINOS who would degrade it for mercenary considerations.

ARETINO must be acknowledged to be the first professional art critic. There were connoisseurs before his time, but they never attempted to put on record their opinions. By printing his criticisms he helped to extend the reputation of many Italian painters. No one would believe that he was always impartial, but if he had a scale of charges TITIAN must in honesty have rewarded the critic by enormous sums. Judging by what he wrote, he considered TITIAN to be the foremost artist of the time. Even if we allow that he was enamoured of the painter's facility—which, as he possessed a similar gift, he declared to be the principal proof of excellence—yet from his remarks we can perceive he was capable to realise the greatness of the most enjoyable of all pictorial poets, the one man who could appreciate equally the beauty of man and this world. ARETINO was not entirely corrupted. Amidst his degradations his spirit could occasionally arise to purer and more honest convictions, but he was of the earth, and soon subsided. There are several portraits of him, but what seems to be more suggestive of his strange nature is the etching by MARC ANTONIO, in which he is seen in a bizarre costume that recalls the turbaned Turk. It suggests power which, under different conditions, might have been turned to more advantage to the men of that age and to those who were to follow them. He lived on safely in Venice until 1557. He was buried in the church of St. Luke. His portrait was introduced by SANSOVINO with those of TITIAN and himself in the bronze door of the sacristy of St. Mark's basilica.

NEW BOOKS.

THE inconsistencies of the weather not only drive holiday takers indoors, but suggest to them that winter is approaching. The true student is always willing to welcome it, because the long evenings enable him to turn to his books with more zest. Publishers are aware of the tendency. They give indications of their coming ventures, and in some cases they take time by the forelock and issue their books as if winter had already taken us in charge.

The record of the "Holiday Rambles among the Cathedrals and Churches of North Germany," by T. FRANCIS BUMPUS (London: T. B. BUMPUS & J. S. BUMPUS), will be familiar to our readers. Students of ecclesiology will find an advantage in having the papers collected within a single volume. It is written in the same spirit as the author's "Summer Holidays among the Glories of France," or, in other words, it testifies that the enthusiasm excited by the Cambridge Camden Society still survives to some extent among churchmen of a later generation. To Mr. BUMPUS churches are not merely architectural monuments, but "living temples of sacrifice and prayer." It is not always advisable to regard German congregations as coming under the influence of their ecclesiastical buildings. Mediæval *instrumenta ecclesiastica* are preserved, although the ritual may be Lutheran. Indeed, we have sometimes observed in the towns as well as in country parishes that Germans were not clear about the extent of the Reformation, and they accept pictures and statues as if they were architectural details like the flowers sculptured around the capitals or other ornamental accessories. Sentiment counts for much with them, and thus they find nothing irregular in the scene which VON ZEDLITZ witnessed, and which he made the subject of one

of his charming poems, in order that it might find imitators. In it a mother is represented as imparting to her baby the Holy Communion she has just received, and this act is described as if it were laudable for exemplifying the sweet power of maternal love and the spirit of the institution. Although it could not be considered orthodox, it suggests the liberality of interpretation in Germany. Sometimes one building serves for congregations who differ in belief, and indeed it is difficult for a stranger unversed in local ecclesiology to determine with what variety of worshippers he participates. On the other hand, the possibility of confusion arising has made the prayer-books in use more definite than is needed in England. As respects the buildings in which the services take place, Gothic and German have been so long associated, it is almost impossible to separate them. What is the true style of the Empire was suggested in Lord LEIGHTON's last Academy discourse as Romanesque, which was, as he said, supplanted, "not, indeed, by evolution and organic growth, as in the Ile de France, but solely by contagion; an importation from without, not a development from within, and therefore without normal inner life; Gothicism supplanted that national form of art in which Germany had till then expressed her powerful idiosyncrasy." Mr. BUMPUS is a zealot for Gothic, and it would be excusable if he confined himself to examples of the style. But the religious spirit is more important still in his eyes, and therefore he presents with equal interest the churches which preceded Gothic, and those which followed its decline. Lord LEIGHTON, for instance, considered the western apse which is so often met with as a violation of every fitness. The use of it is not plain. All Mr. BUMPUS can say is that "it is not unreasonable to assume that it was appropriated to parochial uses, while that at the opposite end contained the altar and choral fittings of the capitular or conventual body." Lord LEIGHTON, in speaking of the Apostel Kirche in Cologne, in which the entrance is through a western transept, points out the scattering of the attention to the right and the left at a point where it should be concentrated on the high altar. Mr. BUMPUS, on the contrary, considers the transept produces an undeniably impressive effect, since it constitutes an internal narthex free from benches. The difference is characteristic. Lord LEIGHTON desired unity of effect and a manifestation of purpose. Mr. BUMPUS is happy even with a partial view, and finds good in everything. The latter is also not afraid to express his own belief, although it may clash with theories, and his book consequently affords the satisfaction which is always to be obtained from an honest declaration of opinion about the impressions received in or before the buildings. There are other parts of Germany no less deserving of examination, and we hope Mr. BUMPUS will undertake the duty. In these days of commercial rivalry and the battle of tariffs much is said against the Germans which is not altogether deserved. They may have changed in many ways, but it is still possible to witness services marked by that old fervour which has accomplished so much.

At present schools ill-adapted for the purpose are used for technical classes. Teachers, however, rebel against arrangements which increase the difficulties of their own work and are not advantageous to students. It may therefore be anticipated that some nearer approach may be made to imitate Continental and American practice in the organisation of science schools, especially when it becomes known that with the makeshifts which have to be utilised economy is as little promoted as efficiency. It is a propitious time for architects wishing to demonstrate that they possess some practical acquaintance with the requirements of professors and students and are competent to satisfy them. In all such cases the first step is the hardest. Mr. T. H. RUSSELL, M.A., who has written a systematic treatise on "The Planning and Fitting-up of Chemical and Physical Laboratories" (London: B. T. BATSFORD), has, in his duties as an architect, worked out the details of the fittings of the chemical department at the Manchester Municipal School. He therefore personally knows how difficult it is to obtain information on the subject. He has accordingly in his book supplied the guidance of which at one time he felt

the need. He treats of elementary science-rooms, chemical laboratories and physical laboratories, including in each case detailed descriptions with illustrations which include working drawings on a small scale. He also gives suggestions on the ventilation, warming and lighting of schools. The book is excellently arranged, and the most successful examples to be found in England are noticed. Professors and teachers have afforded Mr. RUSSELL the benefit of their experience, and the book should be found beside every designer of a science school.

Mr. G. A. T. MIDDLETON has enlarged his useful series of manuals by one on "The Principles of Architectural Perspective" (B. T. BATSFORD). He believes it to be more complete than another, which for some time bore the name. What Captain JACK BUNSBY said of his mysterious platitudes is applicable to books on perspective. They are all good in their way, but "the bearing lies in their application." We suppose in bygone days there were civilians and military officers who plodded systematically through BRADLEY'S exhaustive book, and in earlier years the "Jesuit's Perspective" may have served as a potential exercise for Lent; but no one, unless they were content to see the world rush by, could afford the leisure to master them while training to be an architectural draughtsman. A fault in a perspective view of a building rarely does harm to an architect. He deserves to suffer if it does not show his work at its best. Once a man has discovered the knack of diminishing lines effectively, he rarely has recourse to any authority on the science. Mr. MIDDLETON'S instructions are expressed, so to speak, in the vernacular of the drawing-office. They are preferable, therefore, to what is contained in most of the geometers' treatises, and a novice will find some of his early difficulties removed by their aid. But we doubt if any book by itself will make a competent draughtsman, and as for perplexities they are only without their advantages. One thing is certain, and students never escape them.

As long as examinations take place there will be crammers. Their business is to anticipate the questions likely to be asked and to keep the candidates' attention concentrated on them. Some teachers adopt the wise plan of tearing from a book all the parts which however useful are likely to distract the student. Another way to attain the end is by supplying answers to questions which have been set. Under the title of "Municipal Engineering" (St. Bride's Press, Ltd.) model answers are given to questions put at former examinations of the Incorporated Association of Municipal Engineers. If any of the candidates could answer questions in the same style they might be model young men, for in some cases a single answer runs out to three pages of small print, with diagrams, formulæ, chemical analyses, references to law cases and so on. A surveyor who could be as exhaustive in the limited time allowed for examination would certainly, if he obtained an appointment, be liberal in the use of the stationery provided by the borough. Whether they are practical models or not, the answers supplied may be regarded as a series of essays on varied subjects in which an immense amount of information is contained. They form an epitome of the knowledge required by a municipal engineer. Their use is therefore not confined to men of that class. Building construction, sanitary science, Local Government questions as well as engineering are treated. The questions asked in such examinations lead a roving life and turn up unexpectedly in novel situations. Students submitting themselves to architectural examinations are likely to find questions in the book which they will have to encounter. It would have been an advantage if the authors of the model answers were named. They cannot, we assume, be the examiners, for the general belief of competitors is that every examiner could be "spun out" by his own questions. Indeed, we have heard of a case where a man lost an appointment because he was incapable of answering questions drawn from a book bearing his name on the title-page.

Few people with hobbies have been so fortunate as Dr. GEORGE VIVIAN POORE. In May 1893 he brought out the first edition of his "Rural Hygiene" (LONGMANS, GREEN & Co.), showing how people in the country can utilise sewage. The subject was one which had become a bore, owing to the number of projectors aspiring to

turn filth into gold. However inodorous, it was so simply and earnestly treated by Dr. POORE that three editions of his work were called for. We have already explained the author's system, which is very different to the sanitary methods which have to be adopted in cities and towns. In the third edition the matter has been rearranged and added to. But as before, it mainly relates to the Doctor's own experience. Country gentlemen, for whom life is oppressive, can have a subject for constant attention in imitating Dr. POORE'S example. Architects building country mansions will find it useful to be able to realise what is feasible in combining hygienic arrangements with agriculture on a small scale.

A fourth edition of Mr. J. P. ALLEN'S "Practical Building Construction" has been issued by Messrs. ROSBY LOCKWOOD & SON. It merited that sort of cognition. The author is lecturer on building construction at the College of Science at Newcastle-on-Tyne, and he has taken pains to render his descriptions comprehensible by young students. As there are over a thousand useful diagrams, some on a large scale, it will be evident that efforts have not been spared to make the subjects easily realised. The fourth edition has been revised and extended, containing about eighty additional pages.

A fifth instalment has appeared of "The Modern Carpenter, Joiner and Cabinetmaker" (The Gresham Publishing Company), which is especially remarkable for the clearness of its illustrations. Among them is the roof of the grand avenue of the Glasgow Exhibition, 1901.

"Practical Science for Plumbers, Engineers and Students," by Mr. J. WRIGHT CLARKE, lecturer at the Polytechnic (B. T. BATSFORD), is a praiseworthy endeavour to explain the elementary truths of hydrostatics, hydraulics, heat and temperature, in order that plumbers and others may be able to understand the reasons for what they are doing. The author has observed that classes for such subjects are not attractive, although the practical classes may be crowded. Simple experiments are suggested and examples drawn from things likely to come under the observation of students. The author is not afraid to adduce his own experience as a warning. He says, for instance, that he found in a bank "tinned copper pipes, with wiped soldered joints. The ends of the pipes were socketted into thimbles 1 inch long, well tinned inside and outside, and good bold joints, $3\frac{1}{2}$ inches long, were then wiped over the whole. Many of the joints began to leak within a few years of the work being done." This was owing to the solder being more than the copper, and eventually the two metals were separated. It is not often a teacher shows so much courage.

Another manual by a Polytechnic teacher treats of "Paints, Colours, Oils and Varnishes," published by SCOTT, BROWN & CO. The author, Mr. FURNELL, is a competent authority, and many useful hints are to be derived from the pages.

ROMAN DISCOVERIES IN THE PEAK.

EXPLORERS have come from all parts of England to Brough. The field in which the explorations are being made is the sight of Hope station, and there is nothing in its outward appearance to suggest the existence of archaeological treasures below the surface. The greatest importance is attached by archaeologists and antiquaries to the discovery of a bath believed to be a Roman bath, which supports the opinion that the Romans had baths here as well as at Buxton. An old Roman road known as Bathgate leads directly from the newly-discovered bath through the fields until it reaches Bradwell, and is proved to be in a splendid state of preservation for several miles until it reaches the old Buxton, 10 miles distant. It is therefore a complete ruin of a Roman town that has been buried since those who retired from this country 1,600 years ago.

The bath was completely filled with *débris*. Mr. Garstang and his men devoted all day to its removal, by no means an easy task, seeing that every stone and spadeful of dirt was carefully examined. Its form proved to be oblong, measuring east to west about 12 feet and about 8 feet from north to south. This was the exact shape of the ancient Roman bath at Buxton, though the latter was much larger than the one at Brough. The walls are of beautifully worked gritstone, and the bath is entered at the eastward end by a splendid flight of steps.

Very soon the men rooted out of the *débris* something which proved to be an exceedingly beautiful little Roman altar. It is of gritstone, magnificently worked, and although small is one of the most perfect specimens ever found. It was carefully washed, and was the object of much attention from visitors during the day. But a find of greater importance followed, in the form of a massive triangular shaped stone with an inscription, yet to be deciphered, but which it is believed pertains to the sixth legion. Reared in one corner of the bath was a portion of a massive Roman column or portico, and among the contents were stones about 3 feet square, which tested the strength of half a dozen men. A few bones were found, but they are believed to be chiefly those of cows, sheep or deer. The bottom of the bath was reached, when another piece of stone was found, with Roman characters inscribed thereon, but it proved to be simply a piece to connect with those found, the whole making an inscribed tablet with moulded cornice. The floor is not flagged nor tiled, and in the centre is a tank about a yard square by 18 inches deep. It is a remarkable coincidence that when the ancient Roman bath of Buxton was discovered, the floor was neither flagged nor tiled, but consisted of a composition of lime mixed with coarse sand saturated with blood. There was also a cavity in the floor resembling a boat in shape. Its breadth was about 6 feet, and its depth below the level of the floor and the deepest point of curvature was about 18 inches.

At the north-east corner of the camp, close by a precipitous bank, at the bottom of which flows the river Noe, have been found foundations of what seems to have been a circular tower, and there appears to have been a corresponding tower, somewhat larger in diameter, at the north-west corner.

When the Derbyshire Archaeological Society has completed its excavations for the present summer they will be covered, but such is the extent of the station that it is expected exploration will be continued for several years on the site. Members of the Society will probably visit the spot shortly. The Society is much indebted to Mr. Edward Nicholson, the leaseholder of the land under Colonel Leslie, for the assistance he is rendering. Mr. John Garstang, who is superintending the work on behalf of the Society, is accompanied by his sister. Mr. Garstang, it may be mentioned, conducted the exploration of the Roman fort at Ribchester for two years, and made similar researches at Whitchurch, in Kent, and at Melandra Castle.

The following circular has been issued by Mr. Percy H. Currey, hon. sec. Derbyshire Archaeological and Natural History Society:—

Excavations upon the Roman site at Brough, near Hope, in Derbyshire, have shown that station to have an area and importance which have exceeded expectation. The stout outer walls, the great size of the pretorium, and numerous stone buildings arranged symmetrically within the enclosure are indications of a fortress which has played a definite part in the military history of Roman Britain.

In addition to several altars and architectural remains, there have been found the portions of a large engraved tablet of the second century; the slab has been about 5 feet in length, with deeply-moulded border, inscribed in six rows of large letters; it seems to have been set up while Antoninus Pius was Emperor by a Prefect of the First Cohort of Aquitanians, under Julius Verus, then Governor of Britain. A full reading and an account of the excavations have been promised by the discoverer, Mr. J. Garstang, to the next Journal of the Derbyshire Archaeological Society, under whose auspices the excavations have been made.

The work hitherto has been of an experimental character. The Society is now determined to proceed systematically and thoroughly with the excavations; they are helped by a kind offer of the archaeologist who has made their preliminary exploration to place his services at their disposal in future. They therefore cordially invite a general and generous interest in this undertaking, which is of national interest and necessarily expensive.

BUILDING CONSTRUCTION.

THE science examiners of the Board of Education in their report for 1902 say:—

It appears to be necessary to say that this subject cannot be learned from books alone. More than in the case of any other of the subjects of the group, the practice of building differs from what is taught in the books. The student reads history in old buildings; buildings now being constructed are modified in various ways by the circumstances, the fashion of the time, the money available, the materials in the neighbourhood, &c. Building construction as seen in actual buildings in some degree compares with the development of animals or plants. We speak from experience. The young student requires to have it explained to him why the books differ so far from the house he lives in and from the other familiar buildings which he sees every day.

Every kind of construction may be seen in buildings—the compilers of books appear to profess that they give the best construction. The chief defect in the books is a want of proportion—the old and worn-out methods are retained, given at large, and the new methods are imperfectly given. An important duty of the teacher is to correct this want of proportion in the books; he should himself have a practical knowledge of building—indeed, to be a successful teacher, he must have practical knowledge; one may as well hope to learn anatomy from a book as building construction from books alone.

Judging by the whole results of the examination in this stage the questions were fairly within the present range of the candidates except in regard to their power to apply calculation. More attention should be given to this part of the work. The attention of students should be directed to locks and other fastenings. There are some experiments with materials which are easily made anywhere, as, for example, the mixing of sand and lime or cement, and wetting the mixture and then measuring the resulting mortar; this may be done using old cocoa tins, or other like things, as measures. The students, and perhaps the teachers, may not be able to explain the phenomena which will sometimes present themselves in such simple experiments, but they may be able to get help from others. For example, it is explained that the cement and water hide themselves in the interstices between the grains of sand, but this only goes part of the way, because if dry sand is put into a measure and moderately pressed, adding water makes the sand contract in the measure. An intelligent teacher will notice such things as that lime putty shrinks and cracks like starch in drying, and that mortar does not do so. If one observes the cracks in the plaster on an old ceiling it will be seen that no two cracks quite cross each other at a point. The teacher should ask questions, and he should, above all, encourage his students to ask him questions.

The answering in Honours, Part I., is not equal to what should be expected from honours candidates. The standard of marking was a rather low one, yet a very large proportion of the candidates failed to pass.

In preparing for Honours, Part II., Division I., it may be useful for students to remember that the elements of Classical architecture (the architecture of Greece) are reducible to a few forms. The orders, mouldings and ornaments may be all shown on a few moderate sized sheets of drawings. The student cannot know these too well; he should be able to sketch these from memory; he should be familiar with their marks and tokens. It is not necessary for this examination to burden the memory with the names of many temples, or to go minutely into differences of examples of any one order. With, first, a definite knowledge of the best Greek forms the student should endeavour to trace their evolution from the more ancient forms and also to follow them forward into what they became in the hands of the Romans. He may have his own theories as to architectural degeneracy. He may be able to see in what happened to Greek architecture in the hands of the Romans a suggestion of what has happened to the art of architecture in modern hands. Let us assume that the Parthenon was the most perfect example of Greek architecture—a model of the Parthenon will not serve for a railway station. The modern variety of purposes of buildings introduces great complexity, and we appear to make slow progress in evolving architectural forms suitable to the modern purposes. The best we can do appears to be to use the old forms as decorations. The decorations of the Parthenon were not its pillars, they were its sculptures. Fifty years ago mechanical engineers made use of Classical columns in their machines. They do not do so now, and the change adds much to one's comfort in looking at modern steam-engines. The development of Pointed architecture is comparatively recent, and it may be easily followed: notwithstanding great apparent complexity, the elementary forms are few, and the subject is again a simple one—a temple or church.

In the elemental forms of Classical architecture and also in those of Pointed architecture, the student has examples of the results of progressive development valuable in themselves and valuable for the lessons they teach. Every animal and every plant is exactly fitted for its life, and it is beautiful to the person who can see the fitness; there are, however, some animals and some plants which we think more beautiful than others, as, for example, a horse compared with a crocodile, and a rose compared with a mould. It is a safe rule to design a building with strict regard to its purposes, but there is much room for art outside this. These remarks are not to be taken as oracular; in no subject is there greater room for difference of opinion; it is intended to encourage students to think for themselves, to have opinions of their own, but these original opinions must be associated with enthusiastic work and study.

Thirteen candidates were admitted to the examination in practical design at South Kensington. No really good design was sent in, and the drawing was generally careless, inaccurate and untidy.

This part of the examination is particularly disappointing.

TESSERÆ.

Gothic Ironwork.

THERE are some broad rules which every workman employed in ecclesiastical work must be strictly kept to. The first is, of course, that all kind of casting is absolutely forbidden. Secondly, the file is to be used as seldom as possible. The sharp edges which the unpractised smith wishes to smooth off are just what we want to keep on. Thirdly, the punch is generally not employed enough. If they work with three or four, shaping their heads properly with a file before commencing, it is astonishing what beautiful construction they may effect. Fourthly, never allow them to model in first. The use of one material puts out their hands for another. It is—to compare small things to great—like a performer the organ hurting his touch for that instrument by constant practising on the piano. Let them do at once what has to be done, and there an end, not be perpetually touching and improving. It is better to spoil an article now and then, if so doing we put life and spirit in what is not spoiled. Fifth, teach them that they are not to stand about little prettinesses and neatnesses. When they make one great bold plating-door that are to stand the storms of centuries, they are not to go about it as if they were making filigree work for a lady's writing-desk. They are not to smooth off this rough edge with a hammer in that projection, file down this unevenness. We will excuse some faults for the sake of spirit. We do not want a tame exact copy so much as life. Quentin Matsys was as true a poet in ironwork as Canova was in sculpture or O'Connell in painting, and there is no reason why we should not have another Quentin Matsys: only we shall never get him by tying down our workmen to a mere servile imitation of quatrefoils, or oblong or circular holes.

Lord Burlington as an Architect.

Never were protection and great wealth more generously and more judiciously diffused than by this great person, who had every quality of a genius and artist, except envy. Though his own designs were more chaste and classic than Kent's, he entertained him in his house till his death, and was nevertheless studious to extend his friend's fame than his own. There were many other instances of the painters and artists he encouraged and rewarded. Nor was his munificence confined to his libraries and his own houses and gardens. He spent great sums contributing to public works, and was known to choose that his expense should fall on himself, rather than that his country should be deprived of some beautiful edifices. His enthusiasm for the works of Inigo Jones was so active that he repaired the church of Covent Garden because it was the production of a great master, and purchased a gateway at Beaufort Garden in Chelsea, and transported the identical stones to Chiswick, his religious attachment. With the same zeal for pure architecture he assisted Kent in publishing the designs for Whitehall, and gave a beautiful edition of the antique baths from the drawings of Palladio, whose papers he procured with great care. Besides his works on his own estate at Lonsborough, in Yorkshire, he new-fronted his house in Piccadilly, built by his father, and added the grand colonnade within the courtyard. Campbell, in his "Vitruvius Britannicus," assumes to give the new front of Burlington House and the gateway, but he took no credit for the colonnade, which was in a style far superior to his designs, we may safely conclude it was the Earl's own. His lordship's house at Chiswick, the ideal which is borrowed from a well-known villa of Palladio, a model of taste, though not without faults, some of which are occasioned by too strict adherence to rules and symmetry. Such are too many correspondent doors in spaces so contracted; chimneys between windows, and, which is worse, windows between chimneys, and vestibules, however beautiful, yet too little secured from the damps of this climate. The trusses that support the ceiling of the corner drawing-room are beyond measure massive, and the ground apartment is rather a diminutive catacomb than a library in a northern latitude. Yet these blemishes, and Lord Hervey's wit, who said the house was too small to inhabit and too large to hang to the wall, cannot depreciate the taste that reigns in the whole. The larger court, dignified by picturesque cedars, and the classic scenery of the small court that unites the old and new house, are more worth seeing than many fragments of antiquity, which our travellers visit under all the day's attendant on long voyages. The garden is in the Italian style, but divested of conceits, and far preferable to every style that reigned till our late improvements. The buildings are laid out and not equal to the purity of the house. The lavish quantities of urns and sculpture behind the garden front should be retrenched. Other works designed by Lord Burlington are the dormitory at Westminster School, the assembly-room at York, Lord Harrington's at Petersham, the Duke of Devonshire's house at Whitehall, and General Wade's in Grosvenor Street. Both the latter were ill-conceived and inconvenient, but the latter had so beautiful a front that Lord Chest-

as the general could not live in it to his ease, he had to take a house over against it and look at it." These are details relating to this illustrious person's works. His true praise is better secured in Mr. Pope's epistle to him.

Norman Architecture.

The Norman era may be stated to be from 1066 to 1154, is, from the Conquest to the death of Stephen. In a general comparison with the other nations of Europe, in that age, historians consent that the Normans were eminent, of superior, with respect to civilisation and the arts. In architectural science, as promoted by their religious zeal, they made a great proficiency, and many grand structures had been raised to embellish their own province before they had made an absolute establishment in England. Many dissenting opinions have been advanced concerning what really constitutes Norman architecture, and it has been confounded by the Saxon by several able antiquaries. But a still greater confusion occurs when the Pointed style, first practised in this island in the reign of Henry II., is called Norman. The principal discrimination between the Saxon and the Norman appears to be that of much larger dimensions in every part; but more lofty vaulting; circular pillars of greater diameter; round arches and capitals having ornamental carvings much more elaborate and various adapted to them; and a total absence of pediments or pinnacles which are peculiar to the Pointed or Gothic style. Among the monuments in the early Norman reigns were found men of consummate skill in architecture, which, aided by their munificence, was applied to the rebuilding of their abbeys. No less than fifteen of the twenty-two English cathedrals still retain considerable parts which are undoubtedly of Norman erection, the exact dates of which are ascertained. We have the following enumeration of Norman bishops, who were either architects themselves or under whose auspices architecture flourished:—Gundulf of Rochester (1077-1107), whose works are seen at Winchester, Canterbury and Peterborough. Mauricius of London (1106-1108) built old St. Paul's Cathedral. Roger of Salisbury (1107-40), the cathedral at Old Sarum. Ernulf of Rochester (1105-25) completed Bishop Gundulf's work there. They were followed by monks of Bec in Normandy. Alexander of Lincoln (1123-36) rebuilt his cathedral. Henry of Blois, bishop of Winchester (1129-69), a most celebrated architect, built the conventual churches of St. Cross and Rumsey in Hampshire; and, lastly, Richard, Archbishop of York (1154-81), where none of his works remain. By these architects the Norman manner was properly brought to perfection in England; and it will be supposed that the improvements made by any of them were adopted in succession.

Vases in British Museum.

The series of Greek and Etruscan fictile vases has been principally acquired from the following sources:—The vases were purchased by Sir William Hamilton when British envoy at Naples, and purchased with the remainder of his antiquities in 1788, and may be regarded as the nucleus of the collection, to which a few vases were added by the purchase of the Towneley collection in 1814, that of Lord Elgin's antiquities in 1816, and the purchase of Mr. Richard Payne Knight in 1824. In 1836 the Museum purchased a number of fine vases at the sale of the collection of the Chevalier E. Durand, and again, in 1841, at the sale of part of the Prince of Canino's vases. In 1842, a hundred select vases, chiefly from Vulci in Etruria, were purchased from the Princess of Canino. By these last three purchases the collection, hitherto very deficient in fine specimens from Vulci and Nola, was greatly enriched. The most valuable accessions which have since taken place are the vases from Athens and the Greek islands, purchased from Mr. J. D. Burgon in 1842; those from Camirus, in Rhodes, purchased from Messrs. Salzmann & Biliotti in the course of the years 1859-64; those purchased at the sale of the Pourtalès collection in 1865, and at the sale of the Blacas collection in 1866. Nearly all the vases in the collection have been found in Italy, Sicily, Athens, Corinth, the Islands of the Aegean and the Cyrenaica. From the circumstance that the specimens which first found their way into the museums of Europe came from Etruria, that country was regarded by the antiquaries of the last century as the chief if not the only place of their manufacture; hence they are still popularly called Etruscan vases. As, however, they are found in every part of the ancient world where Greek civilisation flourished, they may for the most part be considered as the work of Greek artists. The vases found in Etruria may be divided into two classes—those made by native artists, which may be rightly called Etruscan, and those which seem to be the work of Greek artists, or at least to have been executed under Hellenic influence. Some of these latter may have been imported into Etruria, others may have been executed by Greek artists in that country. All these vases, though found in different parts, are probably for the most part very similar in form and design, and the fictile ware used in the ancient Greek household

They were employed for a variety of domestic purposes. In most cases the shape of the vase indicates clearly what was its original use; and both in their design and fabric there is generally a happy adaptation to the end for which the object was made.

Mediæval Proportions.

Were it known that a particular architect or school of architects had followed secret rules about the proportions of their buildings we might apply the process of induction with a chance of discovering the rules—we say a chance merely, for besides the imperfection of induction itself, no one can tell that in any particular case the architect may not have been induced to deviate from the rules which his eye and his judgment approved of. The whim of his employer, the remains of former buildings to which he has to adapt his new work, or on whose foundations he has to rear it, and the religious and popular reasons which must have influenced in multifarious ways the rebuilding and enlargement of sanctuaries such as our cathedrals, and the shapes themselves rendered necessary for the convenience of the service—these disturbing causes might well make induction produce a wrong result. But the investigation becomes far more loose and vague when the induction extends over the works of all architects from the Classic times to the present day, and the assumption is not that a certain rule generally pervaded their works, but that there may possibly have been such a rule. We will not stop to compare such a course of reasoning as this with that employed on modern astronomy; to do so would be purely ridiculous. But taking no higher stand than the induction used on history or the study of language in which it has been the cause of so many errors and of so much ridicule, it is easy to see that the research is of a far more certain character than this after the rules of proportion in architecture, because there are prevalent habits of human conduct and human speech, the exceptions from which can be accounted for and the results tested by other circumstances; so that the historian or philologist may, if he exercises due diligence, come to a right conclusion on any subject he investigates for which he has sufficient materials.

Ancient Bronzes.

The names of few sculptors, or rather statuaries, of celebrity have reached us who were not chiefly distinguished for the excellence of their works in bronze. Theodorus of Samos, Gitiadas of Sparta and Glaucias of Ægina held an eminent place among the earlier artists in bronze. A list of the statuaries of Greece, who excelled in works in metal, would almost be a history of sculpture. It will be enough to state that Ageladas, the master of Phidias, Phidias, Alcámenes, Agoracritus, Polyclethus, Myron, Praxiteles and Lysippus exercised and contributed to bring to perfection this branch of art. Bronze-casting seems to have declined in Greece soon after the time of Alexander the Great, about 330 B.C. The accounts given of the number of works executed about that period almost exceed belief. Lysippus alone is said, according to Pliny, to have produced above 600, or, according to another reading, above 1,500. The Romans were never distinguished for the cultivation of the arts of design, and when statues were required by them in the earlier period of their history they were obliged to call in the aid of Etruscan artists. Afterwards, as their empire was extended, the city was filled with the works of the best schools of Greece, and numbers of artists of that country, no longer able to find employment at home, established themselves in the capital of the west. Zenodorus is said to have executed some magnificent works in the time of Nero, and the remains of art of the time of Trajan, Hadrian and the Antonines prove that artists of great skill were living at the date of those emperors. Many of the examples of bronze works that have reached us exhibit signs of having been gilt, and the writers of antiquity refer occasionally to the practice. It does not seem to have been employed till taste had much deteriorated—probably when the value and richness of the material were more highly estimated than the excellence of the workmanship. Nero commanded a statue of Alexander, the work of Lysippus, to be gilt; but Pliny tells us it was found to injure the beauty and effect of the work, and the gold was removed. The greatest destruction at one time of ancient works of art is supposed to have occurred at the taking of Constantinople, in the beginning of the thirteenth century. The collection of statues had been made with great care, and their number had accumulated to an amount which seems quite surprising when it is considered how long a time had elapsed since art had been encouraged or protected. At the period alluded to we are told that some of the finest works of the ancient masters were purposely destroyed, either in mere wantonness, or with the view of turning the material into money or for sale to the metal-founders for the value of the bronze. Among the few works saved from this devastation are the celebrated bronze horses which now decorate the exterior of St. Mark's Church at Venice. They have been ascribed, but without sufficient authority, to Lysippus.

NOTES AND COMMENTS.

THE most productive field possessed by French archaeological explorers is Timgad, or the ancient Thaumugadi, in Northern Africa. The latest discoveries on the site are remarkable. One is a stabulum, or a range of vast stables; four houses which, from the remains of the mosaic and decorations, must have belonged to wealthy citizens; the portico of a great thoroughfare, which was carried through the city from west to east; a double range of colonnades with Doric capitals; and a second market-place, having an area of more than 700 square metres. The last was one of the earliest constructions, for it was the work of the Third Roman Legion, and was supposed to date from the second century. Subsequently the city grew in size, and the old market-place was no longer its centre. The plan is peculiar, and is described as resembling the Greek letter omega. There were two immense basins or fountains, and as the conduits have been traced to hilly ground the water must have been forced to a great height. Both basins were surrounded by Doric or Tuscan columns, each forming a nymphæum, or place of repose, where the eye was delighted not only by the falling water, but by statues and other decorations. All round the wall of the market-place were shops. On account of the marks on stones, which are evidence of constant sharpening of knives, there is no doubt some of these shops were occupied by butchers. In others vegetables were sold. From the number of small terra-cotta figures of animals it is concluded that women visiting the market could bring home toys for their children. The figures may also have been used as substitutes for living animals in offerings to the gods. From its unique character the market-place is the most important archaeological discovery of the twentieth century.

IN 1910, unless administrative changes occur in Paris, the Eiffel Tower will share the fate of numerous other structures, and will be sold as old metal. The difficulty of disposing of its neighbour of the same age, La Galerie des Machines, suggests that seven years hence there will be a similar scarcity of speculators, and the tower may continue to dominate the greater part of Paris. The decision respecting it is connected with the plan which M. BOUVARD, the architectural director of the municipality, has prepared for dealing with the site of the last international exhibition. That enterprise inflicted a terrible loss on Parisians, and it led to an imbroglio which has to be settled decisively. The new scheme involves the transformation of the Champ de Mars, the esplanade of the Invalides, the banks of the river in the vicinity and the garden of the Trocadéro. The immense cascade in the last named, which always impressed strangers, will be cleared away. All available space is to be converted into gardens. The Jena Bridge will be allowed to remain, but it will receive sculptured decorations. M. BOUVARD's plan has been a long time on the tapis, but it has at length obtained the approval of the technical committee of artists and engineers appointed to consider it.

GREAT BRITAIN is the only important country in Europe which does not expend money in sending students of art to Rome. France of course is the most munificent in its outlay, but elsewhere much is done to gain the object by a modest expenditure. The Academy of Art in Berlin has just issued the proposals for 1904. The whole sum to be disposed of is no more than 18,600 marks, or 930,000, and only about a third of it is provided by the State. In other words, there are two Government prizes or bursaries, each of which is worth 3,300 marks. They are to be awarded to a painter and an architect. The remainder of the money is derived from contributions by individuals. The ROHR prize to the value of 4,500 marks is open to the competition of painters of all classes. Then there is the SCHULTZE prize of 3,000 marks for sculptors. Two prizes of 2,250 marks each were founded by MICHEL BEER; one is reserved for Jewish painters, and the other for sculptors, without regard to creed. In most cases the competitors are not to be older than thirty-two years. The subject for

one of the prizes in sculpture is a relief to be placed over the entrance of a library, and for another a relief for music-room. The architect who succeeds need not remain in Italy for more than six months, but the painters and sculptors are expected to live there for a year. The competitions will be held on February 20 and March 1, 1904.

TEN of the members of the Manchester Society of Architects visited Ashbourne, in Derbyshire, on August 1. Almost continuous rain prevented much outdoor sketching. The interior of St. Oswald's church is very interesting, including some good Early English windows and Decorated work, and some fine tombs. The curiously irregular triangular plan, with chapels, gives some very picturesque vistas internally, and a long day's sketching was all too short. On the evening of August 25 fifteen members visited Parr's Bank, Spring Gardens, by the kindness of Messrs. C. HEATHCOTE & SONS, the architects. Mr. HEATHCOTE jun., explained the building to the visitors, and the visit was a very interesting one.

ANOTHER appeal has been issued by the Liverpool Cathedral Building Fund. The diocese, it is said, is now not only an admirable site, but an extremely beautiful, original and exceptionally majestic design for the new cathedral. The sum of 25,000,000 is needed as a further contribution from the diocese during the coming autumn and winter, in order that the required amount of 200,000,000 may be in hand before the anticipated laying of the foundation-stone in the spring of 1904. A much larger sum than this will, of course, be eventually needed to complete the whole cathedral. The time has therefore now arrived when an earnest, fully organised and sustained effort must be entered on throughout the diocese, and it is requested that rural deaneries will now take active measures for pressing forward the important work of collecting funds in all the parishes of their rural deaneries. In order to minimise as much as possible the expenditure of time and trouble by those who have kindly undertaken to act as hon. secretaries or treasurers for the cathedral fund, whether in parish or rural deanery, proper forms have been provided on which the sums collected may be entered. It will conduce in the highest degree to ease and efficiency in the organisation for this important work if secretaries and treasurers will kindly follow the directions.

ILLUSTRATIONS.

BRITISH LINEN CO. BANK, THREADNEEDLE STREET, E.C. GENERAL OFFICE.

FRIMLEY COURT, SURREY.

THIS house is to be erected on a beautiful site close to Frimley, in Surrey. The garden front (not illustrated) overlooks a large lake approached by a terraced garden. The intended materials are, for the walls, red brick from Bracknell, with Ham Hill stone dressings; the roof to be covered with green slates, with lead hips and lead flanges top. The architect is Mr. F. STEWARD TAYLOR, of Southampton and London.

CATHEDRAL SERIES.—EXETER: CHAPTER HOUSE AND CLOISTERS. SOUTH TOWER, FROM PALACE GARDEN.

HOUSE AT BOURNEMOUTH.

SOUTH AFRICAN WAR MEMORIAL TO BE ERECTED AT BOURNEMOUTH.

FOR the memorial now illustrated, Mr. ROBERT BELL, sculptor, of Newcastle-upon-Tyne, is the contractor. The stone is taken from Corncockle Quarry, Dumfriesshire. The four central panels are bronze. The flame portion of the grenade on top and of the four near the panels will be gilded, as well as one or two of the undercut mouldings. The architect is Mr. A. B. PLUMMER, F.R.I.B.A., M.I.A.E., surveyor for the diocese of Newcastle.

ROYDON AND NETHER HALL, ESSEX.*

Roydon.

has been assigned to me, gentlemen, by those who must be obeyed, to conduct as many of you as are willing to accompany me to Roydon, a pleasant village in Essex, situated on the borders of Hertfordshire and near the confluence of the river Stort with its neighbour the Lea, which can boast of great importance and has a conservancy to protect its course. Stort, which flows along through many a sunny mead, rises itself near Broxbourne. Roydon is on the east bank of the rising ground, with one long street from west to east, ending out near the church, and had once a market, for which, as Morant informs us, Edward I. granted a charter in 1271 "here every Thursday and a fair on the 1st and 2nd of August." As far as can be learnt, no such market or fair has been known for many years. A quiet, uneventful life may be passed. There are the usual cottages, houses and barns (at least seven), but with the exception of the telegraph post and telegraph office very little new business or improvements.

ROYDON CHURCH.

A village stocks, whipping-post and lock-up still exist on a green. The church, of fair size and importance, is situated in such a position that whether you enter the village by the railway station or walk down the long street, you get a very pleasant picture. Dedicated to St. Peter, it contains a nave with chancel of the same width, with a north transept from which it is divided by an arcade of three bays, with a tower at the west end. This, as usual at the period of building, is gabled; it contains six bells and has a clock. An oak screen divides, together with an oak-framed arch over the chancel from the nave, where there still remains the altar which Archbishop Laud desired should be placed in the church. In this he was but following earlier authorities who desired to keep out dogs. The pulpit is poor in material and design. The font is in close proximity to the north door; it has probably been removed and rebuilt in its present position. Much work, together with the attempt to make the stone-work inside and out "as good as new" by covering and painting it up with cement, give evidence of late repairs. This is very bad taste, and it is now difficult to at once distinguish our satisfaction the old work, but what we regret is that the carving is treated in the same manner, by painting it no carving at all. We notice this in a spirit of sympathy for we see how little these old buildings were studied, and how little had then been learnt of the various styles of architecture or of the better methods, whilst we do not depreciate

the paper read by Mr. H. G. Quartermain, M.S.A., before the meeting of the Upper Norwood Athenæum.

the efforts men have made or may make to preserve buildings once full of interest to all. There are a few remains of painted sixteenth-century glass. The church measures about 78 feet long east to west, and 37 feet south to north. Registers, 1653.

The general lack of good building materials in Essex has given rise to much of the decay, and ignorance of selection has done more, whilst the ready method found in the use of cement to stop a hole, gaping crack, or to smooth up a broken surface, commended itself to the churchwarden with restricted money bags.

The native stone was of a friable nature, and could not stand the weather in whatever position it was used. On the other hand, there was plenty of flint, small iron stones and a few of that curious conglomerate resembling our concrete, but so exceedingly hard that it could not be worked with tools. Therefore the finer work wherever used, and upon which the greater labour was expended, has been lost to us; it was worked in a bad material, consequently of the skill of the workmen we can learn nothing, although we know it existed, whilst the cheap, ready-to-hand, and probably despised materials still remain put together by the commonest labour.

BRASS IN ROYDON CHURCH, OF THOMAS COLT AND HIS WIFE.

But for many a long year brick has formed the very best building material to be had in Essex. This, however, we may call artificial, something taken from nature, prepared, moulded and burnt to requirements. Whether the art of brickmaking was an imported one (and it may reasonably be supposed to have been introduced from the Low Countries) we will not discuss; but there are many examples of both plain and moulded brickwork of the finest quality, put together in the best and most skilful manner. We could enumerate many such examples in this and the adjoining counties which are still solid, except where some of them have been wilfully damaged or destroyed, perfect in construction, some enriched with the charm of age, and glow of mellow colour upon them.

Nazing Church tower is a very fine example of red brickwork ornamented by that simple but very effective method of using the overburnt black brick headers in diaper work, as it is now called. We find this ornament in almost every old brick building we remember and are charmed with it.

Thus, having proceeded so far, I may venture to excite your interest by quoting the authority of Morant, or one's own notes, and remind you that we are told "Roy" and "dun" are Saxon words signifying "a sweet hill" which gave rise to the name "Mount Pleasant," otherwise "Reydone," "Reyndon," "Duindune," which in the Confessor's time belonged to Ingvar, a freeman, and to five other freemen. At the survey it was holden by Ranulf, brother to Ilger; there was adjoining it a berewich or hamlet, which Richard held of the said Ranulf. These lands were divided into four manors, viz.:—1st, Manor of Roydon; 2nd, Manor of Temple Roydon alias the rectory;

3rd, Manor of Downes; and 4th, that of Nether Hall. Apparently the Baynards were heirs to Ranulphis, and from them it came to the noble family of Fitz-Walter by grant from

ROYDON, SHOWING THE STOCKS.

the Crown upon the felony and forfeiture of William Baynard in Henry I.'s reign. In 1319 Robert Fitz-Walter was found to hold this manor of Reyndon of the king as part of his barony, and in 1285 King Edward I. granted him 200*l.* per annum beside the market, as above stated. In 1290, Robert Fitz-Walter gave this estate and several tenements with the church to the Knights Templars, but in 1311 they were conferred to the Knights Hospitallers, who held them until the general dissolution of religious houses.

The manor then fell to the Crown and continued to be so held until Queen Elizabeth granted it to Francis Lord Norrys, May 23, 1602. On June 23 following she made a grant of the same to Thomas Bellot and Rd. Langley, and they had license the same year to alienate to Sir Rbt. Cecil, afterwards Earl of Salisbury, this manor and rectory of Temple Roydon and advowson of the vicarage. He died possessed of them in May 1612. His great grandson James, Earl of Salisbury, sold them to Sir Josiah Child, Bart., from whom they have descended to the Right Hon. John Earl Tilney.

Nether Hall.

Mention has already been made of Nether Hall, and as we have a little to say of some of its former inhabitants, I think it still best to quote what Morant has recorded.

He informs us that "Nether Hall and land has been holden of Waltham Abbey, which in 1280 purchased here one messuage of twenty-five acres arable and five of pasture of Alex de Abrichesey." The manor is first mentioned in 1401, when the son of John Organ, of London, mercer, conveyed all his tenement called Nether Hall in Reydon and Nasinge to Nicholas Collern and others; and Thomas Prudence, who had it before of the gift of the said John Organ and Margery, his wife, released in 1407 all his right unto Simon Barnewell, of London. It was next in the Colt family and they made it their residence. The first mentioned was Thomas Colt, of Carlisle, and his son Thomas became his heir.

The Colts were parishioners of Roydon, intimately connected with the parish, and recorded by several good brasses to be found in the chancel of the church, most probably over the spot where they were laid 500 years ago. The earliest, from which I have taken a rubbing, is that of Sir Thomas Colte and his wife; he was living in the reign of Edward IV., and employed by him in some honourable post abroad. He died August 10, 1476. It is similar to one of the effigy of Sir Thomas Peyton, of Cambridgeshire, which Planché describes as "a fine specimen of the knightly harness of Richard III.'s reign." The wife of Thomas Colt was Joan, daughter of Trusbutt, of Suffolk, and her costume presents a new-fashioned head-dress. The hair is entirely confined in a cap or caul of gold net or embroidered stuff, and covered by a kerchief of the finest texture, stiffened out as in the previous reign, to resemble a pair of wings. We see that part of the dress of this lady is the ermined jacket, or waistcoat, then fashionable; but from age the enamel now decayed has lost its colour. Still, the engraved lines present to us beautiful forms, and we gain a very shrewd idea that the dress was made of rich materials; the graceful jewelled neck pendant and finger rings all indicate this. It is curious to note the number and positions of the rings; although so many, no indication of what we call the wedding ring.

Other brasses to the Colt family record John Colte, died in 1521; he had two wives, Joane, daughter of Sir Elrington, of Hackney, and Anne, daughter of Sir John Elrington. His family consisted of two sons and five daughters, among whom we are glad to learn married well. There are brasses to Elizabeth Stanley and children, 1589, a civilia 1580, and others. We pick up these threads and joining them we can so connect an old family with places once inhabited and frequented by them.

In connection with John Colt, there is told a tale of Thomas More by his biographers, and repeated by Mr. W. Gerish in the *Home Counties Magazine*, vol. i., which quote:—"In 1505 Sir Thomas having determined by the advice and direction of his ghostly father to take a wife, it was at the time a pleasant conceited gentleman of an ancient family in Essex, one John Colt of New or Nether Hall, invited him unto his house. Being much delighted in company, he proffered unto him the choice of any of his daughters, who were young gentlewomen of very fair complexion, fair complexion, and very religiously inclined, with honest and sweet conversation and virtuous education ended Sir Thomas not a little, and although his affection most set him to the second, for that he thought her fairer and favoured, yet he thought within himself that it would be a grief and sore blemish to the eldest to have the younger preferred before her; he out of kind compassion settled his fancy upon the eldest and soon married her with all her friends good liking."

The situation of Nether Hall may be determined as being enclosed by the ruins of walls, which in all probability form part of the building, together with the larger portion of the remains of the gate house. The site is found to be an oblong of about 160 feet from east to west, and about 110 feet north to south, exclusive of the ground upon which the house stands. The walls are now reduced in height, and a moat, a further means of defence, still exists. There is at the north-west corner of wall an octagon-shaped apartment projecting from main walls, which is pierced with cross loopholes; these are placed so as to command the sides of the walls. This apartment is now unroofed, and an opening has been cut on the south-west side by which the moat can be approached; but there is no indication that this opening is part of the original defence. There are traces of other machicolations in these walls. On the land side of moat, to the south and west, and partly on the east, there are walls of the gate house, which may be the remains of outbuildings and stables. The principal entrance must have been over a bridge which spanned the moat, and so passing through the gate house where traces exist of massive gates. The bridge at this point and part of the moat is destroyed, so that the walls and arches of the two semi-octagonal towers now constitute the main remains. The spiral stairs are partly of brick and oak with handrail cut into thickness of wall. These are well built.

THE RUINS OF NETHER HALL.

construction and solidity. One need only to mention the known legends of the strength, and of the attempts to destroy them, the last of which occurred and failed in 1773. The materials consist of the Essex red brick and black headers with which the walls were decorated in diaper patterns; the size about 9 by $4\frac{1}{4}$ by 2 or $2\frac{1}{4}$ inches; we see that never stone has been used it has perished. I think we may assume that the walls of the house bordered the moat and enclosed by it; that the remains of those we now find are the probability part of the house itself. This leads one to an estimate that the house was but of moderate size. Nether Hall has often been in some way associated with Rye House near by; it is of the same Tudor period of building, of the same material, and both possess some of the ornamental tiled brick arcading and chimneys, but neither of them large houses. They were both defended by moats and now ruins—with this exception, that part of Rye House is in better condition. On the whole, I am led to believe that Nether Hall was the better house, the remains of which show excellent work.

There is, however, to be noted by most of us, with great pleasure, the wonderful resemblance that Nether Hall must have had to the still perfect building belonging to Sir Henry Ponsonby-Bedingfeld, viz. Oxburgh Hall, Norfolk. To gain a true idea of the one, Oxburgh Hall should be seen; for to my

ing were the greater perfection." Professor Huxley says, "It will be admitted that the garden is as much a work of art or artifice as anything that can be mentioned. The energy localised in certain human bodies, directed by similarly localised intellects, has produced a collocation of other material bodies which could not be brought about in the state of nature. The same proposition is true of all the works of men's hands, from a flint implement to a cathedral or chronometer, and it is because it is true that we call these things artificial, term them works of art or artifice, by way of distinguishing them from the products of the cosmic process working outside of man, which we call natural or works of nature. The distinction thus drawn between the works of nature and those of man is universally recognised."

Sir Walter Scott says, "Nothing is more the child of art than a garden?" Wordsworth, in writing to a friend, says, "Laying out grounds, as it is called, may be considered as a liberal art, in some sort, like poetry and painting, and its object is, or ought to be, to move the affections under control of good sense—that is, those of the best and wisest; but, speaking with more precision, it is to assist nature in moving the affections of those who have the deepest perception of the beauties of nature, who have the most valuable feelings, that is, the most permanent, the most independent, the most ennobling with nature and human life."

THE RUINS OF NETHER HALL.

THE FARM YARD, NETHER HALL.

It is clear that not only was it built of about the same materials, except stonework, at the same time, but by the same master builder and workmen.

The illustrations are from photographs by Mr. A. I. Romain, Mr. C. Wheeler and Mr. H. Virgoe.

GARDEN DESIGN IN RELATION TO ARCHITECTURE.*

THE thoughtless people say that a garden is nature, but that a building is not, and my object this evening is to illustrate that a garden, properly speaking, is no more a work of nature—or to be designated as natural—than the house. This appears to me to be so because a garden is formed by human labour, on a most careful system of selection of one material and rejection of another, as is the case in the design of a house.

I propose this evening to emphasise what appears to me to be of no small importance to those who lay out gardens—nevertheless one that is often overlooked—viz that a garden is a work of art, and that there is indeed most distinct unity between the design of gardens and the design of architecture; that the rules of art that apply to the design of the one stand necessarily therefore as a test of merit or failure in the design of the other. In support of the view that gardening is an art, I will quote from the writings of three great men.

Bacon, the prince of gardeners, says, "A man shall be that when ages grow to civility and elegance men shall build stately sooner than to garden finely, as if garden-

Then, if a garden is as much a work of man's art as his house is, it is—owing to their oneness and inseparableness—as much the architect's business to design the garden as to design the house. For the garden is a kind of "betweenity" wherein man has cajoled nature into aiding him in making his house sit comfortably in her midst. It is a place in which her flora and living green are pressed into service as the introduction from primeval wildness to the complete artificiality of the house. And so the garden, with its "host of golden daffodils," its "daisies pink and violets blue," its gay parterres and sweet-scented borders, its wildness and walks of solitude, becomes the outdoor house as the building is the indoor house of the home. The moment you step inside the garden's entrance gates, you come into the region of the home, and as your own arrangement of order commences when you leave the highway, there should be unity in that order; there should at once prevail a harmony in design that shall spread its influence over the whole work of the habitation down to the minutest detail of the house and its equipment. And this unity is scarcely attainable except under the guidance of one designer. This ideal of unity in design is actually what prevailed up to about the end of the seventeenth century; but, owing in general to the break in continuity of traditional art in all its phases at about that date, and in particular to the extravagances into which the art of formal gardening had fallen, there sprang up an aversion to all gardening of the form in which it had been practised from time immemorial and a popular craving for "the wildness of nature," which it was held had been forsaken in the pursuit of visionary ideals of art.

The people had scarcely thought of art in a garden prior to this, nor until they were told by Kent and Brown—the "immortal" Brown, as he was named in his own day—that they had sinned, had violated the laws of nature, and that they must destroy all their fine terraces and make ruins of their gazebos, and return to nature's wildness by adopting his system of "landscape gardening."

* Paper read by Mr. W. R. Butler at a meeting of the Royal Institute of Architects.

And, lo and behold, knowledge seemed to come upon them as it did upon Adam and Eve when "they knew that were naked," and they marvelled that they could have cut nature into trim shapes and wild fantasies, and they verily did destroy the things that this "immortal" told them to. The woodman's axe rang up and down the land as it felled many of the finest avenues the world had ever seen. Terrace walls and steps, fountains and sundials such as have never been erected since, were ruthlessly swept away in order that what was termed nature might be brought up to the very threshold of the house, and all, forsooth, because nature never grew trees in rows or built terrace walls in the forests.

And in place of all that was destroyed what did these champions of nature give to their generation? Among other things they made all their paths and roads to wriggle (the shortest distance between two given points was no longer desirable); they destroyed cut hedges and sunk their garden enclosures into haw-haws, destroying all the charm of seclusion that English gardens had hitherto been so rich in. They made ruins of old architectural adornments in the gardens; nay, more, they built ruins to represent architecture devastated by the ravages of time; they actually erected dead trees among the living ones on their boundaries, the more to counterfeit the primeval forest. They carted boulders to their gardens, and grew the wild things of nature over them, as a make-believe for rocks. They formed watercourses with huge stones in their beds—utterly regardless of the fact that their land was not of a stony nature—over which the water might gurgle and make weak and fraudulent representation of the rushing of the mountain torrent, and rumour has it that they tied stuffed birds of fine plumage in the trees, to the distress of nature's songsters, who, being scared from so unholy a place, built their nests in the clipt hedge of the peasant's garden and sang him their songs instead.

Of beds for flowers they must needs have a few, so they made them of many shapes, because they argued that one of nature's proudest distinctions was her wealth of variety, and therefore the garden must be filled with variety too; so they made beds "shaped as crescents and kidneys, beds like flying bats or bubbling tadpoles, commingled butterflies and leeches, stars and sausages, hearts and commas, monograms and maggots—a motley assortment, to be sure . . . and the pretty flowers smiled a sickly smile, out of their comic beds, as though Paradise itself could provide them with no fairer lodgings." And the wonder is that Brown and his followers were not consistently mad enough in their much-talked-of love of nature to extend their work of destruction of art to the house also, and advise the mud hut or the rock cave in place of the beautiful homes England had so great cause to be proud of. But he went just far enough to insure his system gaining a hold of the people; and although for more than a century now his vacant orbits have been choked with earth's clay, it is only of late years that men of letters have sounded the death-knell of his system, and that we have realised that gardening is an art and not an haphazard product of nature.

Before the end of the seventeenth century the art of formal gardening was in its dotage. Following on Renaissance influence it had run into the wildest extravagances and architectural absurdities. After the Restoration in England, when the intimate relations between Charles II. and Louis XIV. brought the people into closer touch with their neighbours across the Channel, the British mind became much affected by the luxurious extremes in the gardening of the French and Italian schools.

At this time that extraordinary genius Le Nôtre covered 200 acres of ground at Versailles with some of the most wonderful gardening the world has yet seen, and which had it stopped there would probably have been better thought of than it is to-day. But it did not stop; one extreme led to another, and in England the eclectic spirit bespattered the land with innumerable vagaries of Renaissance design, with gigantic water basins among other things, pools of Apollo with dolphins, stone swans and sea nymphs, aplaying at leapfrog in the plash of the fountain, and in the water's midst they placed the artist-god, old Vulcan.

Before, deep fix'd, the eternal anvils stand;
The ponderous hammer loads his better hand.

And over against the willows Artemis turned Actæon into a stag because he had seen her bathing, and there they were, all in the same pool, higgledy-piggledy, many of them the grossest sculptures, and more of them used in execrable taste. And in company with the architecture of the garden the topiary work of the period had gone cranky too; temperance nowhere remained; knots and little geometrical beds, the use of coloured earths and tiles, and a thousand-and-one other tricks and artifices had piloted the art of garden design through the enticing waters of luxury, straight on to the rocks, as like practices have mercifully done in termination of periods of luxury in all branches of art.

Yet I cannot resist a plea for extravagance in gardening, or help thinking that intemperance in it is one of the mild offences against the laws that govern its opposite virtue, man. Aristotle says, "We call not men intemperate so much with respect to the scents of roses or herb perfumes as of ointments and of condiments." You may have the temperance of the miser, and may conceive of intemperance in charity, but the latter is less ignoble than the form, and so in gardening money may be spent intemperately, but this form of extravagance bears with it a certain palliative feeling that at the bottom of it was the love of nature and beauty.

It is, however, not surprising that the effect of the excesses on garden design was a swinging back of the pendulum to primeval nature. But the spirit of the age was bent on follies, so they went to the other extreme, and out of the chaos caused by disgust at excesses sprang the before-mentioned school of landscape gardeners, and its hero and author was the memorable name of Brown, and who, however, happened in 1783. Rest be to his soul.

A few of the far-seeing soon perceived that landscape gardening was not all that it might be. For the advocate of the new system must of necessity still select his trees and shrubs from far and near; he could not let them grow random as in nature; he must clip his hedges or they would outgrow him; he must cut his lawns or they would become prairies; the wild fowl's wings on the pool he must clip too, she will fly away from his unnatural "nature."

He could not entirely exclude design, so his effort was devoted, as before stated, to the attainment of counterfeits of nature. And this creation of counterfeits, or attempted reproduction of nature, is the meanest use to which man has ever put his God-given faculty of art. Nature refuses to be counterfeited, and man's intelligence is too keen to be deceived so long by the profoundest efforts of the warped genius of a straggling fellow mortal.

And this mimicry of nature, this landscape gardening, the only form of garden design that never had, or ever could have, any relation in it to architecture, or for that matter, "anything that is in heaven above, or that is in the earth beneath, or that is in the water under the earth." It cannot be denied that there was nothing original about these new methods of the landscape gardener. They were sheer mimicry made with the deliberate intention of deluding the eye into believing that the hand of man had not interfered with the common processes at work under her natural laws; and failed, as all such systems must fail. For there are certain laws of proportion and curvature, of balance and contrast, that underlie all systems of design; and except these principles, laws of life, exist in them no system of design will live over the passing day until the coming of the final doom.

There can be but two broad types of garden design—the formal type, which was acknowledged from Homer's day till the time when Brown visited us, and is now again acknowledged amongst men of letters and art; and its opposite, known as landscape gardening, which has fruitlessly struggled in the race for a century or so, but has long shown strong signs of distress.

The picturesque name of "landscape" gardening was given to the system it was intended to describe by its foster-parents, who likewise christened the old style "formal"; a term that is not in itself likely to give popularity to the system. These two phrases of "landscape" and "formal" gardening are by no means properly descriptive of the two varieties that stand in the mind for, except perhaps in the extremes of the "formal" type, in which objection can hardly be taken to the term when applied to some of the stiff and soulless designs that are produced under this designation. The line of demarcation between these two extremes, like all imaginary lines between good and bad work in art, is very difficult of definition.

A garden may be more or less "formal," but as it becomes less "formal" it approaches the nearer to its opposite, which might be named more appropriately the formless garden, instead of the "landscape" garden, as the pot-hook path and the kidney bed no more resemble the landscape than the straight path or the bed of geometrical figure. But there is a meeting ground between these two extremes in which we may all confer with the common object of strengthening the elevating and ennobling love of idealised nature in a garden.

I do not say that a garden cannot be interesting and beautiful without cut trees, trimmed edges, geometrical beds, and so on, for the flowers have a happy way of asserting their own beauty wherever you put them. But I do wish to stress most emphatically that for all these things in their proper places a garden is a nobler creation, and that the flower is therein given the greater opportunity to display its grandeur, and, what is more, in this style of garden there is unlimited opportunity for the individuality of the designer; there is also infinite scope for the skill and artistic ability of the owner, seeing that he may develop it this way or that, at his own will, with deeper imprint of higher faculties than

possible in a system that gives to art only a secondary place, if place at all. Any one with a little water and manure can grow a Banksian rose over an old stump—and a very beautiful thing it is, too—but there are very few owners of gardens who have the skill and patience to maintain a well-cut hedge with some good sculptures of his own in it. Any one can plant a shrub, and grow it well with a little care, and it will be a beautiful shrub if grown as nature grows it. A block of marble may be beautiful, too, but it becomes more so if, when we put it into a building, we turn it into a statue of Venus. And so with a shrub; if we bring it into a garden we remove it from its natural bed, we bring it under the influence of art, and we may then add to its natural beauty by putting a little of the soul of man into it in the form of a beautiful bird, such as a peacock.

I do not deny a considerable skill in the growing of plants, but that is the skill of the horticulturist, and is of a less exalted quality than the designer's skill, as it is in all branches of human labour. The horticulturist is the right man to plant and grow a daffodil or a rose, but in matters of designing and laying out of gardens the horticulturist or landscape gardener of the common description is to the garden designer just what the miller is to the architect, what the foreman of the works is to the engineer of a great bridge or sea embankment; and as gardens are so mixed up with architecture, and their constructional designs are so dependent upon the principles that govern architecture, it is almost as much the business of the architect to qualify himself to design the garden as to design the house—and, I may say, his privilege, too, because there is hardly any more pleasurable part of an architect's work than the arrangement of the gardens about the houses of his own design.

It is well known that certain styles and periods in architecture employ varieties of the same geometrical figures, and have often distinctive features common only to themselves. The skyline in one style is broken by the dome or the cupola; in another by the sharp point of the Gothic gable. The windows in some are intricate, in others are square openings in the wall, all of which may have their counterparts in the well-designed garden.

But the everyday house has no very decided architectural functions, neither cupolas nor sharp-pointed gables are common in this country; nevertheless, they do occur, and all of our houses have some features to counteract, or characteristic of, to conform with, that may be met in many ways, as, for instance, in the adoption of the tall and slender or the low and rounded tree, in intricacy or simplicity of beds; or a plain wall may be advisable on this side to supply some deficiency in the design, or on the other side to give stateliness and height to the building.

There are always conditions of site and of aspect, of boundaries and adjoining roads, that must be taken into account, provision should be made for shade from the western sun, in the case of many flowers for protection from the north wind, but on this side it should be of such a nature as not to shut out the winter's sun, which is very low in the northern sky during that period when the garden needs it most.

The planning and laying-out of homely gardens such as are in our reach, and as should surround every house in the country, are matters of constant occurrence. And we have our public gardens also, which, in order that the best results may be obtained in the maximum of pleasure these gardens can give, should be laid out on proper systems of design. Unfortunately the designs of many of them consist chiefly of winding pathways and irregular curves that are utterly devoid of beauty of line or any attractive feature—curves that destroy the feeling of repose and dignity, and that fail to attractively lay the flowers in the borders, or to do aught else than distract your attention from the beauties with which nature has blessed to fill the beds, and to rivet it on their own inherent mess. And as I have said before, there is no relation to architecture in such treatment of a garden, or to nature.

For the laws of nature work as surely through man's intellect of art as they do through any of its processes; a line that is discordant with the laws of art is offensive to the susceptibilities of the mind, and in that respect is unnatural, and this wriggling path in a garden and the other devices of the landscape gardener in no way accord with the laws of art, and are consequently unnatural in every sense of the word. There are hard-and-fast rules of first principles, of proportion, of proportion and curvature, underlying the devices by which all bodies or figures—be they a number of beds, tiles in a pavement, or threads in a fabric—are ordered in juxtaposition so as to present a gratifying result as a uniform whole. And these principles are as necessary in application to the art of garden design as to anything that is apparent.

For to something less than two centuries ago men appeared to do all these things without knowing precisely why or how they did them. They appear to have been done by rote—in fact; but nowadays we seem to have eaten too freely of

the tree of knowledge, we have learnt what good and evil in art is, and unless we apply to our work the plummet and rule of systematised and tested traditional principles of art, we seem to go astray, and shall find that it will not pass muster in the generations to come.

Art in a garden is not opposed to nature in a combative sense; it is the vehicle in which man's attribute of the Deity—his creative power—fashions the materials of nature after the model of his own mind; it is the medium through which he is able to play at being a god himself; and by the aid of this power he has wrought, and put his soul into, many wonderful works on the face of nature, and works that have added to the magnificence of nature; but the moment he tries to make things as nature makes them, he abandons the exercise of his own higher powers and merely proclaims his own folly.

To return to the consideration of the garden, it should first of all be a part of one general scheme with the house; then its individual parts should be uniform, as is the case in the building and its details. De Caux, the architect who designed and laid out the gardens at Wilton House for the Earl of Pembroke, early in the seventeenth century, made twenty-six copperplates to illustrate his design in detail, and in all the more important work of this and earlier dates there seems little doubt that the architect, or rather architect-builder, as he was usually called, designed the house as well as the grounds; and with their designs they supplied much detail, by which means the uniformity was maintained throughout the house and its garden. In the case of a large garden, it must have its parts or plots properly divided off from one another, to give shelter and seclusion and the idea of enclosure, and these blocks should be rectangular, with the greater formality in those next the house; and this principle may be accepted as a guiding rule for both large and small gardens. For the step from outside nature into a beautifully planned and well-kept garden should be manifest immediately, but its choicest prospects should not be thrown into the sight of the casual visitor and unfledged courage; let there be concealed beauties in it to be sought for and prized the more for the finding—beauties that are not open to the view of the uninvited, where one may go

In that sweet mood where pleasure loves to pay
Tribute to ease.

Seclusion is one of the greatest charms in a garden, and it is only to be obtained by its subdivision into parts. You may divide it by the trim and stately hedge—which shall be thick enough to cut recesses in it for a seat here and there if you so fancy. "Little low hedges round like wells, with some pretty pyramids, I like well, and in some places fair columns upon frames of carpenterwork," and you may add a cut peacock or so among the pyramids, if you will, that their weird outline may, alike, add to the solitude of a moonlight reverie and the merry moods of the morning sunshine; or you may divide the parts of the garden with walls and form terraces with steps in infinite variety of design. For there is no stronger link between the house and its garden than walls, steps, garden houses and other architectural accessories, all of which should be of the same character as the house in style and material and in quality of workmanship. The walls should not be built of rustic fashion unless the house is; it is as necessary to build them well as it is the walls of the house. Brickwork makes good colour against the green, but there should be no undue striving for too smooth a face and regular a colour—in Melbourne, at any rate, because our hard-pressed bricks are very little modified by the action of the weather. The light colour of softer bricks one gets in the country gather much finer colour, as you may sometimes see in the older country wayside inns, where reds, yellows and browns mingle in exquisite blending, and with green creepers make the most charming effects.

The use of walls for gardening in Australia is unhappily very rare; our public gardens, as far as I know, have none, and there is no finer effect in garden design than the well-ordered terrace wall, with fine flights of steps and garden houses at its ends. There are men in Australia who might build terrace walls of brick or stone, as fine as those in the old world, with half the money they fool away on horse-racing, and horse-racing is "but nothing to the true pleasure of a garden." And terrace walls, sun-dials and garden houses, if well built, cost nothing to maintain either; in fact, the paths and beds are better sheltered and more easily kept with enclosing walls than in any other way. The walls and steps and other architectural adornments of a garden are the tendrils by which it clings to the house; they stand as peace-makers between the living things and the building, for the ivy, the musk rose and the honeysuckle twine themselves about their stones. They are the loadstone by which the building draws the garden to itself, and the elements in which the unifying characteristics of architectural style may be most readily expressed.

The great terrace wall which Le Nôtre built at St. Germain-en-Laye is a mile and a half long, but many a garden is made

beautiful by such walls of a very limited number of feet in length. And most garden architecture may be built advantageously in a small way, and very economically, too, when occasion requires—as it nearly always does. For instance, when the building is of a more or less rustic, or country, character, thatch or shingle may be sometimes used to cover the summer house or boundary walls—or both—against which an outside background of trees makes a most picturesque and homely effect. One of the reasons we are so devoid of interesting and permanent features in our gardens is that we want everything done in so grand—and in many cases—ostentatious a manner. There are almost innumerable houses that would have made much more refined and complete homes if the money spent in their erection had been better distributed over house and garden; for as a rule a man wishing to build starts with spending on his bare house what his total outlay should be, with the result that in the end there is nothing left for the garden at all, and where the boundary walls should be, he erects fences just good enough to keep the cattle out, and trees are planted where the terrace walls should be, which makes it harder to get the garden into trim ever after.

There are many details about a garden that we may show a sympathetic feeling in, as, for instance, in the entrance gates and gates that may be needed to divide it into different parts. For gates no material equals wrought-iron; cast-iron being brittle must be made heavy to withstand the jarring, and so it is unwieldy and unsuitable, and the repetition of design that we get in it makes it wearisome. Of whatever material the gates may be they should be in accord with the enclosing walls or fences. There are the most unsightly incongruities in many of our outlying suburbs, where you may see gigantic cast-iron gates and pillars—the vulgarity of which is added to by quantities of gilt paint or gold leaf—standing in the midst of the commonest description of wood fencing; and, indeed, you may see the same thing on our country roads, where enormous wood or cumbrous cast-iron gates, and more enormous gate pillars, are set in the ordinary post-and-rail fence; or what is worse, in the fence composed of droppers and barbed wire.

Drinking vessels for birds and suitable shrubs and trees for them to build in attract the thrush and other songsters, which, happily, are increasing in number in our gardens, where they often sit on the highest branch of a lofty tree and sing the evening out or the morning in.

... Is it night or day yet?
Somewhere the birds seem singing still,
Though scarcely now the sun has set.

And as to trees. In the design of a garden it is most important that no trees of the larger kind be planted within the garden proper, or be planted at all for that matter, except with the most careful consideration as to their ultimate growth. The value of trees, both for effective beauty and for shade and shelter, is inestimable, but their being planted thoughtlessly has ruined gardens innumerable, and their eventual removal is a cause of great pain when it at last becomes a necessity.

As to the dimensions of a garden it need by no means be enormously large; some of the most delightful effects are produced in cottage gardening, and a garden of the moderate dimensions that are possible on a fair-sized suburban site may be of the most delightful interest and of "the greatest refreshment to the spirits of man."

Of different types of gardens there are many, all having relation to the architecture of which they form the setting, and in building a house in any style or period the garden should follow the traditional custom also.

The Dutch house should have its small patches of very closely-decorated spaces, after the Dutch style of garden; the Italian house its flight of steps, mighty walls and cascades of water in the Italian type; and the Japanese needs its magic stones, its manufactured hills and dwarf trees and shrubs, all in its own especial character; and some day, if we can get an architectural style of our own, we shall also have an Australian type of garden which, though founded on the English type, will have its own peculiarities arising out of the use of our indigenous ligneous flora—of which we have a goodly number and some of great beauty—and the drier, warmer climate in which we may—with comparatively little care—have a wealth of flowers in our gardens that would make any old English gardener green with envy.

It is foolish to think an Australian garden must be wild because the Australian bush is wild. Far the reverse. There is no reason on earth why we should stultify the art of gardening because our paddocks are full of dead trees. The wild weirdness of our bush country, the vast expanse of our plains, and the romantic splendour of our ranges, have more power to delight the eye and fill the soul with wonder when it has become familiar with the extreme opposite—a finely kept garden. And I am anxious that it should not be thought that because I despise the weak and maudlin methods of the landscape gardeners that therefore I despise nature. On the contrary, I hold that a garden can in no way satisfy a man's

craving for the wildness of nature; in times of extreme sorrow or peril, the garden with its charms and beauties is comfortable, the very flowers seem to mock at one's sorrow; such moods can find sympathy in wild nature only, where there is no sound save the sigh of the wind in the trees or the thundering of the ocean billows. Nothing that man has ever made or ever will make can estrange him from his love of nature or satisfy all his moods. "Art's sounding line it never fathom human nature's emotional depths." Nevertheless it would seem that the food of that love which worships nature is art, as we see that those who hold nature in the highest esteem are painters and poets nursed in the lap of art; and it were as reasonable to expect a great painter to lose his love of nature through painting ideal pictures of it, as to expect a catastrophe to happen to one whose inclinations lead him to the making of a fine garden.

In concluding let me say that I hope some will be convinced and others confirmed in the belief that a garden is a product of man's art—that it is a human thing, as a house is, and although it need not necessarily be stiff or over formal, yet it must be designed in sympathy with the architecture it surrounds, that it must have the mark of human intelligence in it. And as you come back again from a lengthened stay in the Snowy River, and your eye catches the outline of a park and stately hedge, it tells you that you are nearing home; when you see a shape of ideal beauty cut in that same hedge, it brings to your mind that in the midst of nature there is something that is above it all, and that that something is the soul of man. And as you draw nearer and come within the garden and see the dance of the daffodils at the side of the path you will say with Wordsworth—

For oft when on my couch I lie,
In vacant or in pensive mood,
They flash upon that inward eye
Which is the bliss of solitude,
And then my heart with pleasure fills,
And dances with the daffodils.

ROTTEN ROW.

THE local antiquary has been much perplexed by the place-name, says a correspondent of the *Scottish Antiquary*. Camden, the great English antiquary (ob. 1623), explains from old English—*roteran*, to muster, *ridan*, to ride—in an open space in each district used as a muster-ground for Teutonic forefathers. But there are many other shots or suggestions. Everybody is familiar with Rotten Row in Hyde Park, the track reserved for people a-horseback; it has been said about it that in the eighteenth century it was dressed in "rotten" or friable stone. A historian of Edinburgh tells that the Ratounraw at Leith was so named from being a up of houses built of "rattins," which he explains as rotten timber. The author of "Arbroath and its Abbey" suggests that it signifies houses or trees following one another by rotation or in regular succession. Another idea is "route de la place or track reserved for people on horseback; in the Middle Ages the queen's was the only carriage way on such a track. Again, it is said that Rotten Row is a row, retinue row, the route wont to be taken by church processions; this is favoured in Chalmers's "History of the fermline." And again, that it is Norman-French, rather the roundabout way, the way corpses were carried to avoid public thoroughfares. The scribes who wrote Latin charters make it appear as *via Rattonum*, *Vicus Ratonum*—this is, say, Rat Street, ratoune, rottin being Old English for rat. Finally we have a choice of Celtic explanations, and four of them—*rathad'n righ*, sc. the king's road; *rathad'n ra*, sc. the road of the going or proceeding; *rat-hat-an-ra*, sc. the road to the fort; and *rawdenn-rhos*, sc. meadow path. The last is distinguished as a Brythonic etymology.

Besides Rotten Row in Hyde Park, there are Rotten Rows south of the Tweed, particularly in Yorkshire. Just beyond the Border lands called Rotten Row occur in the parish of Caldeck, Cumberland. Where in Scotland do Rotten Rows occur? And in what earliest collocation?

There are at least a score of them still in use or once used as place-names. The Rotten Row of Glasgow is described now "one of the sleepest and most commonplace streets in the city. As a street in the Bishop of Glasgow's burgh (founded in the reign of William the Lion, 1175-1184) it runs from the High Street and the Cathedral Close toward where stood one of the ports or gates of the burgh. It appears on record as early as the year 1283 under the name "Ratonraw;" it was then not a street, but a tract of land in cultivation. It is not associated with rats till the year 1540 when it is described as *Vicus Ratonum*. About that time the Bishop set apart the ground as a site for the college. It has just been authorised to found by Pope Nicholas V. The college was transferred to an area on the east side of the High Street. At the time of the Reformation five

anons of Glasgow Cathedral occupied manse, or "ludgings," the street called the Rotten Row, which then formed the king's highway to Partick.

As early as 1373 (temp. Robert II.) two perches of land lay "the Ratonrav," within the burgh of Haddington. By a deed of 1464, the Carthusians at Perth acquired a land there which had on its west side "the Common Vennel, extending to a church which is commonly called the Rattoun Row." In a charter of 1467 we come upon "the lands of Rattoun Raw" situate in the barony of Ochterlony and shire of Forfar, that a couple of inches east of the burgh of Forfar. At Leith in 173 we hear of the "Vennel, commonly called the Ratouneraw;" and in 1491 of the "Common Vennel, called the Rattounrawe," the barony of Lestalrig, on the south side of the Water of Forth. In 1476 there is mention of a Ratoun Raw at the burgh of the Seytoun of Panbride, in Angus; in 1568 this burgh is referred to as the Westhaven, called "the Ratoun Raw." The name still attaches to a farm on the west side of the road leading from Carnoustie northward to Carlogie. At Arbroath in historic times the Ratoun Raw consisted of a plot of the High Street facing the walls of William the Lion's castle at abbey; it first appears in the abbey cartulary under the year 1496.

Later charter and record references are these. In 1550 a charter passed under Queen Mary's great seal of "the lands of Balfouris-Bochquhoppill, alias Rattoun-row," lying in the barony of Menteith; on these lands the burgh of Kincardine-on-Forth was set up in 1695. A charter of 1562 comprises a house and garden called "the Rattoun Raw" in the burgh of Lauder. Another of 1586 refers to "the one-merk-land of Rattounraw," within the barony of Ochiltree, in Ayrshire; by 1686 this has become a two-merk-land. In 1593 there was a Rattoun-row at the High Street of the then populous burgh of Pittenweem. A man described as William Polwarth, of Rottonraw, appears in the Privy Council register for 1594. In 1640 the burgh of Hilltown, of Dundee, occupied by a colony of net-makers, was set up as a burgh-of-barony; the ancient name of its site was "the Rotten Raw." On Pont & Gordon's map of 1640 there appears another Rottonrow, betwixt Arbrat and Arbrat, in the county of Angus. In an Act of Parliament of 1685, we read of a Rotten-row on the barony of Menteith, near Kirkliston, near Edinburgh. There was a Rottonrow in or near each of the ancient burghs of Montrose, Aberdeen, Brechin and Whithorn. Seven of these sites are in the county of Forfar, two in Fife, and two in the county of Perth. Four are in the ancient earldom of Fife. The furthest north is at Aberdeen; the furthest south at Whithorn. The greater number are beside or near the water.

Of "row" as a street name in the Middle Age there are many instances. We have Newrow, Southrow, Thieffrow, Rottonrow, Buthrow, Quhortor-row, Chakkar-row, Curfew-row, Rottonrow, Nunraw, Skateraw, Gallowraw. But the word was applied to land in the open country. In different parts of the country we have the lands of Cotraw appearing 1372 A.D., 1406, Northraw 1408, Row of Stenchar 1494, Angelrow 1529, Over-row 1537, Langraw 1585, Cauldraw 1586. A daur misca' a Gordon in the Raws o' Strathbogie?"

Some of the explanations of Rottenraw which have been proposed deserve little attention. Via Ratounum does not appear in the charters till the fifteenth century. The black rat came to its way to Europe about the beginning of the sixteenth century, and the brown rat in the eighteenth century, so the Rottenrawists tell us. It would rather seem that the clerks who used the charters of the fifteenth century were already familiar with the rat tribe. But what concerns us here is that Rottonraw had by that time become a word these penmen find difficulty in interpreting; it was already archaic. Then on the list of the Rottonraws in the above list we may be sure there are no timber structures in rows or otherwise. When they used their names they were more than roads or paths, but they were tracts of lands within which a road or street ran very readily and naturally arise. The route de roi of the days was the king's "hie gait," via regia, free to all the king. Neither king nor queen possessed such a thing as a Rottonraw. If church processions are to explain the word, we expect to find each rottenrow in the neighbourhood of a church, such as Glasgow or Arbroath, and not on a remote land of Ochiltree. The sea-town of Panbride, a fertile land of Ochiltree. The ratounraw was something forefathers knew all about when they still worshipped Thor, or Teutates, Hesus and Taranis. If a row or Rottonraw was more than a road or path, as seems clear from the Celtic derivations are inadmissible. Moreover, it is asked of those who support them, can a single Ratounraw within the Highland line be pointed out?

Then Rottonrow was muster-ground, what more natural than that it should be part of the route of church processions or that it should be near a burgh or town or port, or that buildings should arise which afterwards became burgh,

town or port, and that in later days the place suitable for muster-ground should be found suitable for the plough or for horse exercise? The antiquary's word roteran, to muster, survives with us in the form "roster," a muster-roll, and "route," the line of travel for soldiery, and with the Germans in the form ritter-reune, a tournament. In the seventeenth century a "rot" or "ratte," of soldiers was a file of six. With Cromwell, nine "rots" of pikes and twelve "rots" of muskets made a complete company of 126 men. The Parliament of 1650 thought "two rait" of men with a sergeant a sufficient garrison for Inchgarvie. In the sixteenth century a raid, rade, or rode was a military expedition, not a mere foray. In 1457 it was enacted that "na man duellande within burgh be fundyn in manrent nor rout in feir of war with na man bot with the king or his officiaris;" a "routing," contrary to the statute, was prosecuted in 1513, as appears in Pitcairn.

The word or the root has some curious survivals in England. At the time of Domesday the county of York was already distinguished into three ridings—Norttreding, Westtreding and Sudtreding. It appears as roding or rothing on the maps of Essex. A district called the Roothings comprises nine parishes, six in the hundred of Dunmow and three in Ongar—Readings, High Roothing, Aythorp Roothing, Leader Roothing, White Roothing, Margard Roothing, Abess Roothing, Berners Roothing and Beauchamp Roothing. They are connected with the very ancient "Tale of the Wardstaff in Ongar Hundred." The staff, evidently a sort of Teutonic fiery cross, on Hock Day every year was carried from point to point with much ceremony, and finally thrown into the sea at a place called Attewood. Again, once a year a singular spectacle may be seen on one of the Duke of Buccleuch's manors in Warwickshire. At daybreak on November 11 a number of persons representing twenty-seven parishes assemble round a mound on Knightlow Hill, near Dunchurch, and deposit in the hollow of a cross there moneys varying from a penny to over 2s. in value. The penalty for not attending is 20s., with the option of delivering a white bull with a red nose and red ears. The moneys deposited, taken up by the duke's steward, are known as "wroth silver."

In Scotland the word is met with, or seems to be met with, very often as a place-name either alone or with some other affix than now. The remark that it never occurs with gate, vennel, road, street or wynd seems to be well founded. The connections in which it does occur suggest that every Ratouneraw was originally situated in the open country. In a record of 1672 the lands of Redding occur in the parish of Polmont. In 1630 the burgh of New Galloway was set up on the lands of "Roddings," part of the barony of Kenmure. In 1612 there were lands called "the Roddings" near the burgh of Irvine. In a charter of 1565 we read of "the place of Rodding" upon the barony of Rothven, in Banffshire. In 1546 there were lands called "Riding" on the barony of Monkland, in Lanarkshire. The affixes in combination with which the word occurs express some natural feature. Thus, in a charter of 1575 we have the lands of Rydingmure, Lanarkshire. There were lands called Redding-hill or Riddinghill in Ayrshire, and a Rodinlaw in the parish of Ratho, near Edinburgh. A Rydynland occurs as early as 1459 in the shire of Lanark. The Rodaneburn, Reddenburn or Roidenborne, in the parish of Sprouston, Roxburghshire, was in 1553 a recognised place for holding the Days of Truce according to the laws of the Marches. There was a Rottenburn or Routenburn in the parish of Largs, Ayrshire, and a Routingburn in the parish of Dalry, same shire. In Lanarkshire there was a Rottenburn, also a Rotten-caldar, where calder is a synonym for stream. In 1633 there was a Rodding-brae near the Bowbuts at Kinghorn. In 1536 there was a Roder-dike in Stirlingshire; in 1546 a Raddindyke near the Blacklawbuts, on the barony of Kilbryde, in Lanarkshire, and on the coast near Annan the maps show a Riddindyke. Dyke in these cases may have meant a wall or a ditch, or both. In Lanarkshire there was a Riddinburn; in Nithsdale a Reddingwood, and in Ayrshire a Routingbridge. The word even occurs as the Rottenmoss, near the abbey of Crossraguel, and in 1563 there is a charter of a messuage in "the Rottindub," in the burgh of Eyemouth. The word occurs with a prefix in two instances—in 1546 there were lands known as Garrot-roding within the burghal territory of Ayr, and in 1554 there occur in charters lands called Bruce-rodding in Kyle-Stewart, in the same county. These seem to have a striking likeness to the Essex Roddings, and it may not be amiss to recall that Robert the Bruce held much land both in Essex and in Ayrshire.

The Rottenrow that goes furthest back in Scottish record is, as we have seen, that of Glasgow. To the south of the street and within the close of the Greyfriars Church lay a place called Craignaught, at which the great yearly fair of Glasgow was "fenced" or proclaimed regularly during the eighteenth century. There, too, every year betwixt 1550 and 1607 the fencing was enacted, though the Market Cross stood in the High Street, and though the ordinary municipality meetings were held in the Tolbooth or elsewhere. On July 6,

1607, the fair is described as proclaimed at "the Heid Court of Craignach haldin upone the Craig thairof." Then at a place called Summerhill, Simmerfield, or Limmerfield, a court used to be held every year by the burgesses of Glasgow for the purpose of Riding their Marches. After the Whitsunday head-court of 1574, the town's minstrels were, we read, "continued to the Summerhill." True, this ground lay to the east of the cathedral, that is to say, on the other side from the street now known as the Rotten Row, and to which that name has attached at least since the year 1452. But if Ratonraw was archaic in 1452 (as has been shown) and if it was applied to the muster-ground of the bishop's men before there was a burgh of Glasgow, may we not suppose that both Craignacht and Summerhill were parts of it, known to the bishop's men and eventually to the bishop's burgesses, as special gathering places or rallying points?

Old Camden would seem to be right, and the Rotten Row to be properly ranked with such place-names as the Ward, Wardlaw, Bowbutts, Blacklawbutts, Schutting-lewis, Justinlees, Justinghaugh, Barrasgate, Barreislands, Marshallmeadows, Trumpetersknow, Shottonlaw and Sheriffmuir.

ENGINEERING STANDARDS.

A SHORT review of the work of the engineering standards committee has been issued by the secretary, Mr. Leslie S. Robertson, who concludes that "the epitome sufficiently indicates the enormous importance of the work in hand to the trade of the Empire. The Premier, Mr. Arnold-Forster, Sir John Wolfe Barry and others have expressed opinions as to the immense value of its labours, the result of which it is difficult to overrate if they are loyally supported by the trade and commerce of this country as by the Government and its various departments."

The movement was set on foot in the beginning of 1901, when the five leading technical institutions, the Civil Engineers, Mechanical Engineers, Naval Architects, Iron and Steel Institute and Electrical Engineers supplied funds and formed committees in order to introduce into this country a national standardised system, and thus bring British manufacturers into line with their American and German rivals. The work grew enormously, and the Government, recognising its national importance, made a grant of 3,000*l.* towards the expenses, and now the leading manufacturers are also subscribing to the support of the engineering standards committee. No less than twenty-seven committees have been at work during the past three years, with 170 members, including twenty-five representatives of Government departments, and the results of their labours so far are very satisfactory.

Referring to the committee on bridges and general building construction, presided over by Sir Benjamin Baker, the report says that their labours have been confined principally to drawing up a series of standards so as to meet all the requirements of general building construction, and they have succeeded in making a considerable reduction from the large number formerly in vogue, and some of the leading firms are already adopting them. In the matter of tramway rails the sub-committee have agreed upon a series of standards which have been approved by the Board of Trade and have even been rolled abroad. The sub-committee on railway rails is at present engaged in drawing up a series of standard flat-bottom rails, standard bull-headed rails and standard specifications for the same. The work of this committee is nearing completion. The committee on cement, which includes all the leading consulting engineers, contractors and manufacturers, is proceeding with its work, as is also the committee on cast-iron flanges, over which Mr. W. H. Maw presides. Cast-iron pipes will also be taken in hand by this committee.

The standardising of electrical plant is presided over by Sir William Preece, and four sub-committees have been doing a lot of useful work. The sub-committee on generators, motors and transformers have been collecting evidence for the determination of standard voltages and frequencies, and the standard sizes for dynamos and motors. The other electrical committees deal with such subjects as cables and conduits, telegraphs and telephones and the temperatures of insulating materials.

As an evidence of the friendly relations existing between this country and our neighbours across the Channel, the French Government have sent over a commissioner to study the procedure and the lines upon which the engineering standards committee had been organised. While the object of the fiscal inquiry may be said to be to keep the trade of the country within the limits of our Empire and to mutually support the various branches of commerce, the work of the engineering standards committee is already effecting this without in any way disturbing the relations between ourselves and any other nations, by co-operation between the designers and producers and principal users, thus securing for our leading industries stability in manufacture and even raising the standard of work.

GENERAL.

Herr Lippay, the Viennese painter, is in Rome for the purpose of painting a full-sized portrait of the Pope.

The Bishop of Bangor last week placed the memorial stone of a church which is in course of erection, at an approximate cost of 4,000*l.*, at Nevin, on the Carnarvonshire coast. The structure has been designed by Mr. P. Shearson Gregory, architect, Bangor.

The Excavations at Caerwent are continued. The present is the fourth year of the committee's work, and it promises to produce satisfactory results. The most important features recently brought to light are some Roman houses, the schools, with a later house overlying one of them. It is impossible to fix the date of this later house, but it is certainly Roman. It includes a small subterranean chamber, or cell, built largely of Roman materials. The line of pipes which was traced near the north gate was again discovered in the field, with the addition of a small concrete culvert, and several interesting portions of streets have been discovered.

Excavations are in progress in the island of Santa Maria, the ancient Leucadia, which some archaeologists believe to be the dominion of Ulysses, instead of Ithaca. It is mentioned by Homer. In shape and size Leucadia resembles the Isle of Man.

A Painting by Paul Delaroche, which was exhibited in the Salon of 1837, has been added to the Bethnal Green Museum. The subject is "St. Cecilia and the Angels."

A Large Basin of water, measuring 1,639 square yards and 12 feet deep, is to be constructed near the bastion of the Boulevard Victor, Paris, for the purpose of conducting experiments with models of war-ships for the French navy previous to their being built. It is hoped by the arrangement to avoid making serious mistakes and wasting money.

The Camille Bernier Museum has been inaugurated at the Château Keriolet, Brittany. It comprises about seventy paintings, designs and engravings of the artist, who died in 1891, of his work in that part of France. The collection has been presented to the Department by the painter's widow.

The Zionist Congress at Basel decided to appoint a special autonomous Palestine committee of three members to engage in the scientific and practical exploration of Palestine. A year's grant of 600*l.* was voted to this committee.

M. Mercet's statue of William Tell at Lausanne has suffered by the fall of the cross-bow. The failure is owing to the stock being formed of two pieces of marble, and when the iron tenons followed.

Herr Kurtz began last week at Marienbad to paint a portrait of King Edward, in which His Majesty will be standing among the people undergoing the cure.

We regret to announce the death of Mr. Willy Brookes on Thursday, August 28, through an accident which occurred on the railway adjoining the sidings of Brookes, Ltd., at Hoxholme, Halifax. There was no gentleman better known to the stone trade or more respected.

The Furniture Trades' Provident and Benevolent Association has recently been formed in order to benefit and other members of the furniture trade in times of sickness and distress, and to provide for the education and maintenance of orphans. The offices of the Association are at 250 Finsbury Pavement House, E.C. The president, Mr. S. J. Warington, is supported by a strong board of management. A fund-raising dinner in aid of the funds will be held at the Criterion Restaurant on November 14.

The Columbia Fireproofing Company has had its system of floor construction for spans up to 19 feet approved by the New York Bureau of Buildings after the official tests.

A Memorial Cross to the late Lord Wantage, Viscount of Berkshire, has been erected on the Berkshire Downs. The memorial is upon an ancient beacon barrow; it consists of a stone pillar approached on the north and south by steps, and has on the two other sides a stone bench. In the centre is an octagonal pedestal of Portland stone bearing inscriptions; on top of the double-stepped grey marble circular base, from which a marble pillar supporting a short red marble shaft, terminating in a carved white marble cross. The height from the base of the platform to the top of the cross is 33 feet 6 inches. The column and cross are an exact copy of the fifteenth-century cross of San Zenobio at Florence, and were carved in Italy.

The Prospectus of the Architectural Association for the session 1903-4 has appeared. After March 25 the work will be carried on at the Royal Architectural Museum. The term of the Day School will commence on September 1st, and in the Studio in the evening of that day. The first general meeting will be held on October 16.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

To communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIGHTON.—Nov. 9.—Designs are invited for a new hospital. Premiums of 50*l*., 30*l*., and 20*l*. will be paid to the first, second and third premiated designs respectively. Particulars up to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Brighton and Hove Hospital for Women, 76 West Street, Brighton.

DUBLIN.—Sept. 30.—Designs and specifications wanted for workmen's cottages, semi-detached or terraces, each cottage to exceed 100*l*.. The successful plan to become the property of the company on payment of 20*l*. Mr. Francis B. Ormsby, Great Southern and Western Railway, Kingsbridge Terminus, Dublin.

ELHAM.—Oct. 7.—For sewage disposal of the village of Stood. Report, plan and estimate of probable cost. Premium 30 guineas. Further particulars, Mr. R. Loneragan, Cheriton Place, Folkestone.

HEYWOOD.—Sept. 14.—Competitive designs are invited for library building to be erected in Church Street at a cost of 100*l*.. Premiums of 30*l*., 20*l*. and 10*l*. will be awarded for

designs adjudged of sufficient merit and placed first, second and third in order respectively. Mr. J. Ainsworth Settle, Municipal Buildings, Heywood, Lancs.

HOWDEN.—Sept. 12.—Plans and estimates are invited for improving and extending the sewerage of the contributory place of Howden. The successful competitor will be awarded a sum of 15*l* and the usual commission for superintending the execution of the works. Mr. Henry Green, clerk.

IRELAND.—Sept. 30.—The Great Southern and Western Railway Company offer a prize of 20*l*. for the best design and specification of workmen's cottages, built either semi-detached or in terraces. Mr. Francis B. Ormsby, secretary, Knightsbridge Terminus, Dublin.

LEYLAND.—Sept. 26.—Plans are invited for the laying-out and development for municipal and other purposes of about 11,902 square yards of land in Church Road and Sandy Lane, Leyland, Lancs. A premium of 15*l* 15*s*. is offered to the author of the plan considered to be the best design. Mr. M. H. Wilkinson, surveyor, 21 Towngate, Leyland.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75*l*. for design placed first, and one of 25*l*. for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100*l*., 50*l*. and 30*l*. respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

SCOTLAND.—Sept. 22.—Competitive plans are invited for the erection of a hospital and offices. Conditions of the competition and full particulars may be obtained from Mr. J. E. Shaw, clerk to the Lunacy Board, County Buildings, Ayr.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100*l*., 50*l*. and 25*l*. will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

BUILDING AND BUILDERS.

PE memorial-stone of a new Sunday school and parochial all adjoining and associated with the church of St. Augustine, rinksway, Stockport, has been laid.

IT is proposed to purchase a site for a church to be built the new district of St. Mark, Levenshulme, recently formed from the parish of St. Peter's, Levenshulme. The cost of the e was 340/. The population of the new district is 3,500.

IT is proposed to build a new vicarage for the parish of owe Bridge, near Atherton, at a cost of about 2,000/., on a e adjoining the church. The site has been conveyed to the ecclesiastical Commissioners, from whom a grant towards the est is expected.

WARDLEY HALL, at Worsley, near Manchester, one of the most picturesque buildings in Lancashire, is being renovated and beautified. It is reported that Colonel Davies, who is to take an active share in the management of the Bridgewater estates after their transfer to the Earl of Ellesmere, will be the next tenant of Wardley Hall.

HOLY TRINITY CHURCH, Southport (the Rev C. S. Hope), standing in one of the oldest churchyards of the town, has been for some time considered unsafe for the congregation to meet and services consequently have been held in the school-room. The fabric is now being taken down with a view to another church being erected on the same site.

THE old viaduct which crosses the Seine at Passy having become inadequate to the traffic of the Metropolitan Circular Railway and the ordinary traffic, the feat of removing the entire bridge is proceeding and side widening sections of enormous weight are being put in place. These sections are being transported by means of boats and huge cranes. Enormous crowds of interested spectators have gathered in the neighbourhood watching the scene, which was singularly animated.

SOME time ago the Barrow Town Council rejected Sir Benjamin Baker's scheme for a bridge to Walney Island owing to the cost, which was put down at 124,000/. Vickers, Sons & Maxim have offered that if the Council build a bridge and levy a twopenny rate the company will make up the remaining amount required to meet interest and redemption. On Thursday the general purposes committee decided to recommend the Council to accept this offer. Within the past two years the population of Walney has increased more than 5,000 owing to the building of Vickerstown North and Vickerstown South.

THE foundation-stone was laid on the 29th ult. of St. John's new church at Hopwood, Lancs. The new church is to be built on the site formerly occupied by an iron structure which had done good service as a place of worship for nearly twenty-two years, but which on account of not being weatherproof and being far from comfortable for the worshippers, has been pulled down since Whitsuntide. The portion of the new church to be erected under the present contract is estimated to cost about 4,000/., and will consist of the nave and aisle, up to and including the permanent chancel arch. The nave will be built of stone, but the chancel, which will be of brick, is temporary only, and will be replaced with a permanent structure as soon as funds will allow. When completed the edifice will be 110 feet long and 52 feet wide inside, and will afford accommodation for a congregation of 480. The east end of the north aisle will be arranged as a morning chapel; a dwarf wall and three steps will separate the chancel from the nave, and the chancel will be 33 feet long.

A CONFERENCE has been held at Flixton of representatives from the Lancashire and Cheshire County Councils and the local parochial committees with respect to the construction of a new bridge over the river Mersey between Carrington and Flixton. The existing bridge, which was erected over half a century ago, has long been in a dangerous condition for vehicular traffic. The conference recommended the construc-

tion of a new bridge, the site of which is to be situate nearer Flixton than the present structure, and the cost is to be borne jointly by the County Councils and the Barton Rural District Council, and the Manchester Corporation will pay a certain sum for the privilege of closing a road. A letter was read from the county bridgemaister enclosing a plan of the proposed bridge and the improvements which it will be necessary for the parish council to carry out in regard to the approaches of the bridge. The plan, after a brief discussion, was approved, and the County Council is to be notified to that effect.

THE Garden City Pioneer Company, Ltd., has acquired about 4,000 acres of land near Hitchin on which to build the first Garden City. The estate is about thirty-four miles from London, and the nearest point is little over a mile from Hitchin Junction, on the Great Northern Railway, the latter being reached in forty-two minutes from King's Cross. The site is well situated for establishing a residential and manufacturing town. It is intersected in the centre by the Cambridge branch of the Great Northern Railway. The district is also served by the Midland Railway, and the Great Eastern is within touch. The land is intersected by good roads with extensive frontage and adjoins the Great North Road from London. There is ample building material in the district to be obtained at low cost, and there is a good supply of labour. The soil is admirably adapted for residential purposes, the geological strata consisting of chalk partly overlaid with gravel, and there is an ample supply of good water to be obtained. The site is situated at an altitude of from 250 to 300 feet above sea-level, and there are magnificent views of the surrounding country to be obtained. Most of the site has a southern aspect; it is extremely compact, and is ready for immediate development. The land has been secured at a reasonable price, and no difficulty is anticipated in carrying out a successful commercial enterprise, without departing from the principles of the movement. A company with a large capital will shortly be formed to carry out the scheme. A cumulative dividend limited to 5 per cent. per annum will be paid to the shareholders, and the balance of profit will be used for the benefit of the town and its inhabitants. If the enterprise is successful this profit cannot fail to be large. It is proposed to have a Press view of the estate at an early date, and a public conference will be held on the site, probably in the first week of October. Further information regarding the scheme and these meetings can be obtained from the secretary of the company, Mr. Thomas Adams, 347-351 Birkbeck Bank Chambers, Holborn, W.C.

TRADE NOTES.

THE whole of the beautiful mosaic work in connection with the new Gaiety Theatre, of which Mr. Ernest Rüntz is the architect, has been entrusted to the well-known firm, Messrs. Diespeker, Ltd., of Holborn Viaduct, London.

THE Edinburgh Life Assurance Company have opened a West End office at No. 174 Piccadilly, W., under the charge, as West End secretary, of Mr. Alexander Robertson, late of the Law Union and Crown Insurance Company, Chancery Lane.

THE Planet Foundry Company's new works at Bridge have recently been painted with Hall's sanitary washable distemper, which was supplied to the decorators by the executors of W. H. Bridge, German Street Works, Old Trafford, Manchester.

A NEW Cambridge quarter-chime clock, showing the time on four external illuminated dials, has just been erected in the parish church, Ballincolly, co. Donegal, Ireland, with Lord Grimthorpe's latest improvements inserted by Messrs. Wm. Potts & Sons, clock manufacturers, of Leeds and Newcastle-on-Tyne.

WE have on previous occasions referred to the excellent qualities of Velure, a new and perfected Japan paint, and the satisfaction its use has given when applied to numerous purposes. Being sanitary and washable, and the fact that it does not crack, chip, peel, blister or fade, combined with its remarkable spreading, elastic and weather-resisting properties, meeting with a large and increasing demand, including a metropolitan and provincial boroughs. Messrs. Wm. Fairlie & Son, of Fairlie, Scotland, who designed for Sir Thomas Lipton his racing yacht *Shamrock III*, selected Velure, after several trials, for painting it above and below water on account of its beautiful colour and surface, elasticity, durability and perfect smoothness.

LIGVITIEM is a chemical preparation recently introduced by Messrs. Dennis & Roberts, wholesale druggists, of Church Street, Nottingham, for the protection and preservation of wood, bricks, stone, plaster, &c., a purpose which, it is claimed, it fulfils in a remarkable manner, as it penetrates into the material, forces out the moisture, makes it proof against water and all noxious agents. Under its powerful preservative qualities dry rot and premature decay are unknown, and its application, either by painting or immersion, requires no special

only ordinary care in handling. One gallon of Ligvitem, which costs 2s. 6d., will coat over from 25 to 50 square yards, according to condition and surface. The application of Ligvitem will, we are assured, not only prevent but arrest decay, and is especially applicable to all existing structures. The same remark applies with equal force to posts, poles, masts, timber in ships, boats, mines, &c. In addition to its preservative qualities it imparts to the wood a rich brown stain.

VARIETIES.

THE new school buildings at Clutton, Somerset, were opened on the 28th ult.

MR HEPWORTH COLLINS, consulting chemist and civil engineer, intimates that his address is now—Care of Mr O. M. Wihl, B.A., LL.B., Messrs. Edward Wihl & Co., 17 Nicholas Street, Manchester.

WE understand that the next exhibition to be held at Earl's Court will be entitled "Austria in London." The management will be in the able hands of Mr. W. Höfler, of Soho Square, W. This should be a guarantee of its success.

THE new joint hospital for Kincardineshire, which has been built at a cost of about 8,000*l.*, was formally opened on the 28th ult. by Sir Alexander Baird, Bart., Lord Lieutenant of the county. The new hospital has been erected on a very fine site near Stonehaven railway station, and is built on the cottage principle.

NOTICES have been posted in several large engineering establishments in Belfast intimating that after the expiration of thirty days the workmen's wages will be reduced by 5 per cent. About 3,000 men are affected. It is stated that the reasons given by the employers are not so much declining trade as the keenness of competition with Continental and American firms in the production of certain machinery, the greater portion of which is manufactured in Belfast for export.

THE twenty-ninth annual congress of the Incorporated Sanitary Association of Scotland takes place at Stranraer this week. The honorary presidents are Provost the Viscount of Strathclyde and Sir Herbert Maxwell, Bart., M.P. The annual meeting was held on Wednesday evening. The proceedings proper began on Thursday morning, when Professor Glaister, Glasgow, delivered the presidential address. Other papers were read, and in the afternoon, on the invitation of Stranraer Town Council, the members drove to Castle-Kennedy. In the

evening the annual dinner was held in St. Andrew's Hall. To-day (Friday) several subjects are down for discussion. There will be a drive to Lochnan in the afternoon, and on Saturday it has been arranged to have a special excursion round Ailsa Craig by the *Princess Victoria*.

THE new home of the Little Sisters of the Poor which has been erected at Cobridge, Staffs, was opened on the 27th ult. The site of the new home abuts upon Cobridge Road, the main front being to the south and overlooking Wolstanton. The building just opened is only a part of the home as planned, and gives accommodation for about ninety old people and about twelve sisters. It is proposed at some future date to add another wing to the structure, and the present buildings will then be utilised as men's quarters, and the additional buildings will be set apart for women. When complete it will accommodate about 150 old people and twenty sisters. The lowest floor, which is a semi-basement, comprises sisters' refectory, kitchen, scullery, various store-rooms, a men's smoke-room and the heating chambers. On the ground floor is the main entrance, with reception or waiting-rooms on either side, a temporary chapel with its sacristy, men's infirm dormitory, men's day-room, with scullery attached. On the first and second floors are women's day-rooms, with scullery attached, dormitories, clothes stores, sisters' oratory and a bath-room on each floor. On the third floor are large box-rooms, and rooms that may be used as dormitories if necessity arises. The building is of the plainest and simplest character, as befits a charitable institution of its kind, but care has been exercised to provide a convenient and comfortable home. It is heated throughout with hot water on the low-pressure system and is well-ventilated. The cost, fitted complete, has been about 7,000*l.* The architects are Messrs. R. Scrivener & Son, of Hanley, and the general contractors Messrs. C. Cornes & Sons, of Hanley.

NEW CATALOGUE.

WE have received from the Simplex Steel Conduit Company, Ltd., of Westinghouse Buildings, Norfolk Street, Strand, and 20 Bucklersbury, E.C., a copy of their new "Abridged Price List," with which is bound up a reprint of the very useful new wiring rules of the Institute of Electrical Engineers. This list is an abridgment of and is used in connection with their 200 pp catalogue, which although only issued as recently as in

MINIATURE C. R. SPECIAL LUG MOUNTING. NEW TYPE.

SIMPLEX TURN SWITCH.

SIMPLEX VERTICAL PENDANT.

form, and the illustrations, of which there is a profusion, are reduced. Two additional types of conduit are now listed to meet special cases, viz. Simplex "wire duct" and Simplex "solid drawn" conduits. The illustrations which we reproduce represent a Simplex ceiling rose fitting which has a new type of special lug mounting, the simplicity of which is obvious. Other simple appliances are the Simplex miniature turn-switch fitting and the Simplex vertical pendant, of which we also reproduce illustrations.

This very useful little auxiliary list is especially compiled for those who have not already received copies of the current list, and for those who require the prices in a handy form for office use or for the use of their foremen, &c.

FIRE TEST OF "URALITE."

"URALITE" has again emerged triumphant from a fire which took place on Wednesday last on the Nottingham Forest Football Club's ground in the presence of a large number of architects, builders, fire insurance officials, Corporation officials, the fire brigade and other gentlemen. A screen was erected consisting of ordinary timber covered with "Uralite," and against this a huge bonfire was lighted, made of timber soaked in petroleum. In the middle of the bonfire a wooden box was placed constructed of timber covered with "Uralite," and inside the box were placed a quantity of papers, sulphur, paraffin wax and fusible metal. After the fire had burned itself out the box was opened (the temperature which it had been subject was at times as high as 1,850° Fahr.), and it was found that the contents were uninjured. The inside of the box was not even warm to the hand. The back of the screen never reached more than a few degrees above the normal temperature of the atmosphere.

All present expressed themselves as highly pleased with the results of the test, and predicted a great future for the material. It has already been adopted by 100 different buildings for a great variety of purposes, notably in connection with electric-railway carriages for covering the underside of the carriages for protection against fire caused by short circuits, for railway panels, for roofs of all kinds of buildings, for ceilings, partitions and doors in factories and workshops.

The War Office, Admiralty and Office of Works' official insurance companies and all who are interested in fire protection think very highly of the material. The representative of the British Uralite Company present were Mr. Armstrong, commercial manager, Mr. Watson, works manager, and Mr. Smith, assistant city manager.

STATUARY IN LEEDS CITY SQUARE.

At a special meeting of the Leeds City Council held on Wednesday, the Lord Mayor (Mr. John Ward) moved upon the occasion of the completion of City Square, the freedom of the city of Leeds should be conferred upon Mr. T. W. Harding, an alderman, and in the year 1898-99 the mayor of the city, in recognition of the able services rendered by him in the city for many years past, and of the public interest for which he had at all times been distinguished in the furtherance of the culture of art in the city, and of which a notable instance was to be found in the generous gift by him of

estrian statue of the Black Prince and other statues for adornment of City Square. The Lord Mayor said that Colonel Harding had spent his means most liberally in the interests of the city. The motion was seconded by Mr. Drury, who said that, though he had strongly opposed the erection of the statue in City Square, this did not prevent him from heartily supporting the resolution. The resolution was carried unanimously.

The scheme for the adorning of the Square, says the *Mercury*, is now fast approaching completion. The equestrian statue of the Black Prince, by Mr. T. Black, R.A., is being placed in position. Round this central figure—the gift of Colonel Harding—are already grouped other smaller bronze statues of John Harrison, a Leeds benefactor of the sixteenth century; Dean Hook, the great vicar of Leeds; Joseph Priestley, the discoverer of oxygen, who one time was the pastor of Mill Hill Unitarian Chapel, close by the Square; and James Watt, the inventor of the modern condensing steam-engine. The statue of Priestley is by Mr. Alfred Drury, and those of John Harrison and James Watt by Mr. H. C. Fehr, whilst the statue of the Dean is the work of Mr. F. W. Pomeroy. In addition there are four pairs of nude female figures in bronze by Mr. Drury, representing "Night" and "Morning." These are as electric-light standards, and there are also large ornamental lamps rising from figured bases in bronze representing groups of children. The whole has been subscribed privately, Colonel Harding being the chief donor, whilst Councillor Boston and the late Mr. Wainwright have also contributed statues. Lord Rosebery has been approached with respect to the opening of the Square, but is unable to visit for the purpose, and it is now probable that Colonel Harding himself or the Lord Mayor will be called upon to inaugurate. The opening ceremony is provisionally fixed for the 1st inst.

SALFORD TOWN HALL.

At the meeting of the Salford Council on Wednesday Mr. Hodgson called attention to a proposal on the part of the town and markets committee to erect a suite of offices on the site bounded by the Health and Water Departments' buildings, Market Street, Ford Street and Cleminson Street, and asked what would be the probable cost?

Mr. Rudman said the estimated cost was about

12,000*l.* The time had come when something must be done in this matter, for the accommodation at the town hall was wholly inadequate. He was quite aware that some gentlemen held the view that something more than this should be done, but he contended that the present state of the borough's finances did not justify them in going in for a new town hall at a cost of three or four hundred thousand pounds. Moreover, so urgent was the need for increased accommodation that they could not possibly wait for eight or ten years whilst a new town hall was being built. All the details regarding the proposal mentioned by Mr. Hodgson would be placed before the general purposes committee as soon as possible.

GLASGOW SCHOOL OF ART.

THE Glasgow School of Art was founded in the year 1840 in premises in Ingram Street. In 1869 the school removed to the Corporation Buildings, Sauchiehall Street, and the trustees of the "Haldane's Academy of the Fine Arts" agreed to contribute towards its funds on condition that the words "Haldane Academy" were added to its title.

In 1892 the governing body was made representative of the principal public bodies of the city, and the school was registered under the Companies Act with the title "The Glasgow School of Art," the words "Haldane Academy" being deleted.

In 1894 the Bellahouston Trustees granted a sum of 10,000*l.*, the Town Council made a contribution of 5,000*l.*, and the Governors obtained public subscriptions of 6,000*l.* for a new building.

The memorial-stone was laid on May 25, 1898, by the late Sir Renny Watson, and on December 20, 1899, the new school was formally opened by Sir James King, Bart., in the presence of Lord Provost Chisholm.

In 1899 the Scotch Office took over the control of the science and art education of Scotland, and in September 1901 the Glasgow School of Art was established as the Central Institution for Higher Art Education for Glasgow and the West of Scotland. Payments upon results have been abolished, and an annual block grant has been made. "To obtain this grant it will be necessary that there should be an annual contribution to the funds of the school from sources other than the grant, but exclusive of income from fees, equal to the said grant." There is now no connection between the school and the English Board of Education. The system of examinations and national competition are no longer

obligatory. The Governors are authorised by the Scotch Office to grant diplomas and certificates to students and to teachers. These diplomas are to be awarded upon the results of a course of instruction, together with special tests. They are to bear the official endorsement of the Scotch Office, and will be accepted by that department as proofs of technical capacity. Aided by a subsidy from the Scotch Office, maintenance and other bursaries are competed for by students; while free studentships and scholarships are open for competition among the students, and under certain conditions to outside candidates. About two-thirds of the building are completed, and the foundations are laid for the remainder. The Governors ask for funds to complete the building.

VALUE OF GENERATING WORKS.

THE award of Sir John Wolfe Barry as umpire in the arbitration which has recently been held to determine the amount to be paid by the London County Council to the Metropolitan Electric Supply Company, Ltd., for the compulsory acquisition by the Council of the company's generating works at Sardinia Street, Lincoln's Inn Fields, has been given. The London Improvements Act, 1899, provided that, in addition to vesting in the company a new site of equivalent area to their present one, the Council were to pay to the company a sum equal to the costs and expenses of erecting and fitting up a new generating station upon a new site with new plant of a capacity to generate and supply electrical energy to an output of not less than 4,000 kilowatts, and all expenses incurred in replacing, relaying and altering mains. The amount of the award is 183,150*l*.

PRODUCTION OF IRON AND STEEL.

IN his address as president of the Iron and Steel Institute, Mr. Andrew Carnegie described the increase in production in America, Great Britain and Germany. He said:—It would appear that in 1873 the Pennsylvania Steel Company made 20,000 tons of steel rails. They now made that amount in two weeks. The Bethlehem Iron Company were then engaged in raising a loan of the amount of 20,000*l*. for the extension of their works; that was 100,000 dollars; 5,000,000 would be comparatively less to-day. The great Cambria Iron Works,

near Pittsburgh, were credited with having made no less than 1,027½ tons of ingots in the week ended September 26, the largest quantity then ever made in a week. That would be a day's work at the present time. The total of pig-iron in the United States in 1872 was 2,897,000 net tons; to-day it produced 20,000,000 per annum. The product of steel, nearly 15,000,000 tons, was greater than the rest of the world. In 1874 Great Britain made 643,317 tons of steel, whilst last year the output was 4,909,000 tons. Germany in 1874 made 361,000 tons; last year there were made in that country 6,394,000 tons. In 1874 Great Britain made 6,054,000 tons of pig-iron, Germany 1,906,000 tons. Last year the corresponding figures were 8,517,000 tons and 8,403,000 tons respectively. In 1874 the world was producing nearly 14,000,000 tons of pig-iron and 280,000,000 tons of coal. There were now being produced 41,000,000 tons of pig-iron and 780,000,000 tons of coal. The largest output of a furnace known up to the week ended September 7, 1874, was 702½ tons, or about 100 tons a day. Two new Carnegie furnaces had recently produced 650 tons each day for months at a time. In 1874 the Carnegie works were considered scarcely worth noticing, as their steel plant was then under consideration. Continuing, Mr. Carnegie said that the work of a week was now done in a day, but, great as was the contrast, there was one still greater. There had been no loss and sold without loss hundreds of thousands of 4-inch billets at 3 lbs. for 1*d*. Surely the limit had been reached there. He thought it had been, and he considered it doubtful whether there would ever be a lower price for steel. On the contrary there was every indication that period after period the price of steel was likely to become dearer owing to the lack of material. To make 3 lbs. of steel at least 10 lbs. of material were required—3 lbs. of coke, 1½ lb. of lime and 4½ lbs. of iron stone. These materials had to be transported great distances and transferred twice, once from the cars into the ship and again from the ship into the railway cars. How it was done Mr. Carnegie did not pretend to say, but he knew the figures were correct. Every time he repeated them he doubted his possibility. The price mentioned was that which was obtained during the day of depression, when everything was at the lowest. Costs were several dollars per ton higher to-day during this period of boom in America. Such was the contrast between 1874 and 1903. What would it be twenty-nine years hence—what changes were to come? He had tried to imagine some of the features. It was scarcely possible that Great Britain could increase its product of iron and steel material. The vital element was

supply of iron ore, and the attention of iron and steel manufacturers should be directed to where and how they could obtain a supply. This was also a question which the manufacturers of America could not safely neglect, and it was for this reason that the United States Steel Corporation secured an abundant supply of the best ore obtainable. For sixty years the United States Steel Corporation could be supplied at its present rate of consumption, but that time was as nothing in the life of a nation. It was upon future discoveries of iron ore that the continuance of cheap steel manufacturing even in America would depend. There were immense deposits in now inaccessible parts. In Utah, for instance, and in Southern California large quantities had been found, so that steel would continue to be manufactured, but it would be no surprise if it were very greatly advanced in the future. It seemed almost miraculous that such an article as steel could be produced and sold without loss at 3 lbs. for 1d., and he was convinced that this was a thing of the past. It would be a question of increased cost, and therefore of increased price, so that neither Britain nor America need fear that steel manufacture would be wholly lost. The world would gladly pay the increased price. During the next half-century it would seem that America was to increase her output at a tremendous pace. The output of Britain would, perhaps, remain stationary, or even increase somewhat, if developments in Norway and Sweden proved satisfactory.

DANGEROUSLY CRYSTALLINE STEEL.

PAPER on "The Restoration of Dangerously Crystalline Steel by Heat Treatment," by Messrs. J. E. Stead and A. W. Richards, was read at the meeting of the Iron and Steel Institute on Tuesday. Mr. Stead said he wished to correct an erroneous statement which had appeared in the Press. It had been stated that he had made some discoveries which were revolutionary. The facts he was about to set forth were not in the least degree revolutionary. It was needful to say this, because the uneasiness had been caused in regard to plant and machinery being rendered obsolete. The authors commenced by pointing out that it had been completely demonstrated that even steel of coarse structure, but not necessarily brittle, is heated to a certain temperature, and then is allowed to cool in air or is quenched in oil or water, the original structure is destroyed, and is replaced by one of a very fine character. Mr.

Stead in 1898 had demonstrated that pure iron, when coarsely crystalline and of exceedingly brittle character, resembling cast zinc more than any other metal, by heating to the critical or just above the critical point A-C. 3 (840 C), was restored to very excellent qualities so as to resemble the same iron in the condition in which it left the rolls. The authors had for several years devoted much time and attention to the effect of heat on the mechanical properties of steel. They had repeatedly restored dangerously crystalline steel in large pieces by simple heat treatment, and obtained material which would be accepted by any engineer as excellent. They thought therefore an account of the work would not be without value, and would tend to show that the so-called generally received impression that dangerously crystalline steel must be formed in order to restore it to good qualities was, excepting in rare cases, quite unfounded. They had found dangerously crystalline steel to occur in three classes of the metal. The first class occurred only in mild steel very low in carbon, and in pure iron it was caused by annealing for a long period at too low a temperature in a slightly oxidising atmosphere. The second class, which was equally dangerously crystalline, was very common; it was produced by long-continued heating at high temperature. The third variety occasionally met with was produced by heating the steel until it was practically burnt. In the third class, although the metal could be gradually improved by heat treatment, it could never be thoroughly restored simply in that way. In the case of steel of the first and second classes no such difficulty was found, heat treatment making it equal and more often superior to the forged steel which had been worked and finished at proper temperatures. The authors proceeded to give at considerable length details of experiments made on rails, and also gave particulars of some tests made with 5-inch steel blooms. The question of resistance to repeated alternations of stress was next dealt with, the manner in which tests were carried out being given. The conclusions arrived at by the authors were that the microscope indicated that heating at high temperatures causes a great development in the size of the crystalline grains, and reheating to about 870 degs. restores the original or a better structure. They further found that if all structural steels in their normal rolled or forged condition are good, they can be readily deteriorated in quality by heating to a temperature a little above that to which steel is most commonly heated previous to rolling or forging. Steel made brittle by such heating can be completely restored to the best possible condition

without forging down to a smaller size or by remelting. Practically the results of the authors' investigations showed that not only the original good qualities of normal rolled steel after being made brittle are restored by the exceedingly simple treatment of reheating to about 900 degs. C. for a very short time, but that such steel is made considerably better than it was. That soft steel could be restored by heating was previously known, but that carbon steels could actually be made superior to the original properly-forged metal by reheating at 870 degs. C. and cooling in air was a fact retailed for the first time at the Düsseldorf meeting of last year. Mr. Stead had urged the imperative necessity of reheating all forgings to 900 deg. C. and allowing them to cool in the air to remove accidental brittleness, and the results given in the paper bore out the statement then made. The authors also urged that in every large forge and smith shop a Le Chatelier pyrometer should be introduced, and, in addition, suitable furnaces for reheating the forgings should be established. It is a fact that in many works steel is forged, rolled and finished at temperatures far above that which is the best for the endurance of the steel when put into practical use, and the authors feel confident that if the appliances to which reference has been made were to be intelligently employed the finished forgings would be greatly improved. If such a course were followed the great margins of safety now demanded by engineers would not be necessary. The authors aimed at making material which would be twice or three times as enduring as that commonly met with at the present day. Further, the authors stated that the system often specified by engineers that forgings when being annealed should not be heated to a temperature high enough to cause a scale was wrong.

WORKS IN SOUTH ITALY.

THE Consular Agent in Capri considers that British capital might be employed with considerable advantage in the acquisition of suitable building sites, which are yearly becoming scarcer and have doubled in value in the last ten years, and in the erection on such sites of small villas of from five to eight rooms, which could be let during the winter months at remunerative rents.

Another urgent need in Capri is a generous and unfailing water supply. At present the inhabitants are entirely dependent on the rain-water collected in their respective cisterns; this water is wholesome, but insufficient. With an increased and adequate supply of water not only would water be provided in generous measure for domestic purposes, but gardens would flourish throughout the year, and it would be possible to supply the entire demand for vegetables, which are now brought from the mainland. On the mountain above the town of Capri, at a height of about 1,000 feet above the sea-level, nature has provided a natural reservoir in an extensive valley. According to the opinions of competent engineers, this valley could be formed into an immense tank or reservoir at a comparatively small cost, there being sufficient pressure to force the water to the top of any house in the town of Capri. Here, again, there seems to be a favourable outlet for British capital and enterprise.

A company has been formed to supply electric light, and as an integral part of their scheme a funicular railway is to be constructed from the little port on the north side of the island to the village at the top of the hill. This will take the passengers up and down at a nominal price, and will be an undoubted convenience for bathing purposes to the residents, as well as of great utility in enabling passing travellers to see much more of the place in the limited time at their disposal than is possible in existing circumstances. It is quite likely that this railway will make Capri into a southern bathing station, which will do very materially to its prosperity.

An electric station is now in working order in Salerno and is distributing force to its customers. This will ultimately reduce the demand for coal and provide light as well as power to the factories.

The Government has promised several millions of lire for public works in the neighbourhood, but very little has been done. Small improvements have been made in the harbour works at Salerno, and something has been done towards excavating the harbour at Amalfi, which was filled up by a landslip some years ago. In February 1902 a landslip occurred near Vietri, which caused a good deal of anxiety both to the railway company and the Royal Engineers, as the main railway to the south was threatened. It was eventually determined to clear away the vast mass which showed signs of slipping. This turned out to be a very serious matter, but

impossible to blast owing to the Vietri station being below, the whole mountain side had to be removed by the spade and pickaxe. The line had to be closed during working hours, and, except for the night trains, the traffic had to take a circuitous route by one of the branch lines. The town of Salerno has an insufficient water supply, and had to be provided with proper waterworks. No serious proposals have as yet been made to the municipality for a concession, nor will they be made except by foreign capitalists. There was without water until a British company stepped in. They resold their concession at a profit before the works were completed, having joined issue with the municipality on a technical point, but the new company has been financially successful, and there can be little doubt that Salerno, with its 25,000 inhabitants, besides its populous suburbs, would form an excellent field for an enterprise of the kind. To this a large scheme should be added to carry away the sewage from the upper part of the town into the sea at some distant point among the marshes of Battipaglia. The lower part of the town presents great difficulties, as a pumping station would be required. At present the condition of the sea in front of the town is absolutely dangerous to the health of the population. The rains flowing into the tideless water at the doors of the houses. The Bill for the construction, upkeep and working of an aqueduct for the supply of potable water to the three Apulian provinces, Foggia, Bari and Lecce, has been approved by the Government, and meanwhile the Superior Council on Public Works has concluded the examination of the regulations and conditions, subject to which tenders from private contractors will be received; the international competition will take place on February 1, 1904, and British contractors wishing to tender will not fail to bestir themselves betimes and obtain particulars from the Italian consuls in the United Kingdom. For public works executed on account of the municipality of Salerno, 3,900,000 lire have been spent, the greater part of which sum has been appropriated to the paving and upkeep of the streets; new streets which are projected for 1903, and refer principally to the paving and paving the streets, would cause an expenditure of 600,000 lire. The large steel works at Terni were mainly established by Government assistance. The steel made there was excellent, and the Government insisted that it should be used by Messrs. Vickers & Co. for the making of guns for the Italian navy, although British steel would have cost less money. Messrs.

Armstrong now have their own steel works at Pozzuoli, and are consequently independent of the Terni works. These last have now taken the lead in establishing a steel trust of 60,000,000 lire (2,400,000,000 francs), and have obtained the adhesion of the following works:—Orlando and Odero (12,000,000 lire), the Siderurgica of Savona (9,000,000 lire), the Elba Steel Works (16,000,000 lire), Raggio, at Sestri Ponente (6,000,000 lire), and the Ligurian of Ancona (3,000,000 lire). The only steel works of importance outside the trust are those of Ansaldo at Genoa, the others being all small manufacturers.

GERMAN TRADE COURTS.

It is consistent with the protectionist spirit characteristic of the German commercial policy that German industry endeavours more and more to isolate itself; that it is anxious to safeguard real or imaginary business secrets, that it continues to press its claim that foreigners be as far as possible excluded from its technical schools, and that it bars its factory doors to every foreign visitor.

As the working and results of special trade courts have been most satisfactory a Bill has now been introduced in the Imperial Diet which is to create special "commercial courts." The trade courts, roughly speaking, consist of a president and a tribunal, one-half of which are employers and the other half employed, both groups being elected by the litigants. They are competent to decide questions arising out of the contracts of employment, and their procedure is very much quicker and cheaper than that of the ordinary courts. The creation of commercial courts on similar lines to decide purely mercantile questions seemed all the more desirable, as once the claim exceeds 300 marks the ordinary local court (Amtsgericht) is no longer competent, and the case goes before the county court (Landgericht), where litigation is more tedious and more expensive, because the parties must be represented by counsel.

Section 1 of the new Bill provides that in towns of more than 20,000 inhabitants special commercial courts are to be established to settle disputes arising out of the relations of merchant and clerk. In case of need such commercial courts may also be established in communities with a population of less than 20,000, or several communities may combine for this purpose. Before the establishment of such commercial courts the opinion of independent merchants and of a similar number of clerks must be taken. Once the court has been established

the provisions of this Bill shall not apply to clerks with a salary exceeding 3,000 marks, nor to chemists' assistants nor apprentices.

Section 3 provides that these courts shall have jurisdiction in the following cases, regardless of the amounts at issue:—

(1) Concerning the commencement, continuation, termination of the relationship of merchant and clerk, and concerning the issue and contents of certificates; (2) concerning the duties under the contract; (3) concerning the return of sureties, testimonials, letters of identification or other articles which were in consequence of the relationship of merchant and clerk handed over; (4) concerning claims for damages or payment of fines or penalties in case of non-fulfilment or improper fulfilment of the duties under Sections 1 to 3; also claims, &c., for the illegal or incorrect entries in testimonials, in the receipt books for insurance against illness or for old age pensions; (5) concerning the calculation of the clerk's share towards the above insurances and respective entrance fees (*vide* Sections 53 and 65 of the law regulating insurance against sickness).

Disputes concerning obligations under contracts, limiting the clerk's freedom after the termination of the contract of employment, do not fall under the jurisdiction of the commercial court.

Besides the president, who must be neither merchant nor clerk, the tribunal is to consist of at least four members, one-half of this number being independent merchants, one-half employés; where trade courts already exist the new commercial courts are to work in connection with the same. These commercial courts will undoubtedly prove of special advantage to the clerks. Their incomes, as a rule, do not enable them to accumulate considerable savings; they have to rely upon the punctual payment of their wages, and can hardly afford the delay of payment which litigation in the ordinary courts would entail, more especially as it is difficult to find a new place while differences with the former employer are pending; in cases where the salary claimed exceeds 300 marks the compulsion of the county court to engage counsel no longer exists.

IMPROVEMENTS AT EUSTON.

By permission of Mr. E. H. Thornhill, the chief engineer, a number of members of the Civil and Mechanical Engineers' Society and others were afforded the opportunity on Saturday

afternoon of inspecting the widening works which have been undertaken by the London and North-Western Railway Company near Euston. Good progress has been made with the scheme, which was commenced two years ago. The difficulties in the way have been various, but these have all been overcome. The ground, upon which hundreds of workmen are now engaged, was at one time covered by row on row of poor class dwellings. All these have had to be bought up and new homes found for the tenants—no easy matter in so congested a district as that between Euston and Camden Town. Practically three thoroughfares have disappeared, namely, Mornington Street, Stanhope Street and the old Serpentine Road. The main idea of the new works is to provide adequate accommodation for housing and shunting passenger coaches close at hand. At present, after an express arrives at Euston, the carriages have to be taken out again over the down main line to Willesden, a distance of five miles, and when wanted, brought back empty to the terminus once more. Thus, about ten miles have to be covered by this unpaying traffic, in addition to which the line is continually occupied, to the hindrance of other trains. The effect of the widening and improvements generally will thus be very marked. Near Mornington Crescent a large space has been cleared, and when necessary excavations have been finished, sheds are to be erected in which there will be space for 350 coaches, where there will be room for more on the sidings near by. The sheds will be reached by a subway which is being driven under the main line, so that trains can be run out of Euston direct through this to the sidings without any delay to more important traffic. In addition, a tunnel is being constructed through which engines can be run out towards Chalk Farm.

These operations, which have already proved very costly, cover an area, roughly speaking, of about 5,000 square yards, and have necessitated as much as 45,000 cubic yards of excavation. All this earth is taken out by truck to Willesden, where it is being formed into a bank on which a goods siding will be made. The contractors, Messrs. Joseph T. Firbank & Co., Ltd., have already had to put in a tremendous quantity of brickwork, as very strong retaining walls have to be built round the space for the carriage sheds and sidings to support roads and property in the vicinity. It is expected that all will be completed by the end of next year, and then, as well as having increased room for rolling-stock close to their terminus, the Company will be able to utilise the line which now is devoted to standing trucks and carriages as a second up-road.

THE WEEK.

It was a bold stroke on the part of Sir NORMAN LOCKYER to suggest, in his address at Southport on Wednesday, that the British Association should become the guiding authority for the education which modern trade demands. His effort is the more remarkable if we remember how closely the President has been connected with governmental endeavours to give instruction on science that would be useful in manufactures. After experience in the War Office he was secretary to the Commission on Science and Art Department. But it was made plain from his address that neither in war nor in science has he much faith in the official system which wields supreme power, although it represents only the weaknesses of the British nature. The British Association, which dates from 1831, was always remarkable for its catholicity of spirit, and the men who have been most successful in applying science to industrialism have been found among its members. But can we expect that they would submit to be controlled by the class of men who are entrusted with the administration of Government departments? Sir NORMAN LOCKYER as an old official no doubt enjoys special privileges when dealing with circumlocutionism; but where is the busy engineer, chemist or electrician who could go through the ordeal which is imposed by even coming at a Government office on public business? In times of difficulty like the present there are alluring prospects of a reform of official ways, but they are only illusory. Whether Sir NORMAN LOCKYER speaks as an agent or as an independent follower of science, we need not inquire, but an alliance between the Education Office and the British Association would not be effectual in creating a system of teaching superior to that of the Germans or Americans. If the British Association is eager to co-operate it will be found that the City and Guilds of London Institute is the germ which is the most promising and therefore most deserving of support.

M. DAGNAN-BOUVERET is recognised as one of the great masters of French art. He is one of the few men whose picture pieces are looked at respectfully. His eastern scenes are remarkable, and he can paint rural and humble subjects with a success that arises from his apparent sympathy with them. His works are prized, and an unusual incident relating to some of them has occurred. On August 2 a police-inspector in Paris was informed in confidence that a band of thieves who frequented an establishment kept by a gymnast and boxer intended to make a nocturnal attack on a studio on the Boulevard Bineau, in order to carry off a painting of great value. The inspector came to the conclusion that M. DAGNAN-BOUVERET was destined to be the victim. It was arranged with him that the picture, which was worth 12,000*fr.*, was to be removed and only unfinished details left in the studio. One of the gang had served as a model to the artist. The inspector and four policemen took possession of the house. On the second night the attack was made. The model and another Italian, as well as the gymnast, were arrested. As nothing was removed they were found guilty of attempted robbery. The two Italians were sentenced to two years' imprisonment and the other to fifteen months. As a rule there was sufficient loyalty among models to prevent them from becoming thieves of artists who employed them, but the race is deteriorating. To remove a large and valuable painting which had recently appeared in the Salon would at one time be considered as an act which only madmen would attempt. Fortunately there are dealers who are willing to support robberies and so-called patrons of art who are ignorant of the origin of their acquisitions.

The description which THACKERAY gives of the life of Duke ANTON OF LÜNEBURG, the founder of the Royal Family of Great Britain, is well known. According to him Duke ANTON held his Court at Celle, a little town of 10,000

people, in the midst of great plains of sand. "It was a very humble wood-built place with a great brick church." Not far from Celle there stood in the village of Wietze an ancient mill which was often used as a court of justice by the dukes. There were certain special rights which the inhabitants could claim, and they were investigated in the simple building. Claims connected with evictions, tolls, fees, fires, heirship were determined with a primitive expedition that would now amaze German lawyers. In more ancient days plaintiffs and defendants filled up forms which were arranged as questions and answers, but afterwards there was a kind of code to which reference had to be made. The Roi d'Yvetot could not have administered justice in a more patriarchal spirit. Wietze was considered to be in the midst of a hunting district; sport and law could be combined. If a return to Celle was not considered desirable, the mill served as a palace. The mill is about to be demolished in order to make way for a different building. The interest which surrounds so novel a Temple of Themis is not enough to preserve it.

DINANT, on the Meuse, which stands in one of the most picturesque regions of Europe, offers now another attraction, for in it is an exhibition of early works of the coppersmiths and other metalworkers who some centuries back gained a reputation for the town. The examples are various. There are balustrades of brass and chandeliers which formerly belonged to some of the churches. The numerous fonts suggest the variety of styles which were in favour, and which the craftsmen of Dinant found no difficulty in producing. In order to make the exhibition more useful reproductions of works in other countries have been introduced. One is the great candelabrum in the form of a tree from the chapel dell' Albero in Milan Cathedral, and which is the work of several artists such as BRAMBELLA, FUSINA, GOBBO, &c. Gothic art is also represented by several excellent examples. Space is provided for metalwork of a more humble kind, used for ordinary domestic purposes. Belgium has preserved a marvellous quantity of old work, and every exhibition like that of Dinant excites surprise from its wealth, beauty and novelty. The exhibition will remain open until October 12.

It is expected that the sarcophagus of the Empress FREDERICK WILLIAM, the Princess Royal of Great Britain, will be placed in the Friedenskirche, Potsdam, towards the end of next month. Professor REINHOLD BEGAS has almost completed his work. By the desire of the late Empress the material used is Greek marble, which on account of its hardness has been difficult to chisel. The sleeping figure is complete and the sculptor is now engaged on the finishing strokes of the two reliefs, which are suggestive of life on earth and in heaven.

THE narrative of the difficulties encountered by BELZONI when he attempted to explore the Tombs of the Kings at Thebes can still be read with interest. Afterwards WILKINSON followed his example. His advice to others who contemplated visiting the subterranean chambers, which were ingeniously planned to insure concealment, was not encouraging. He said:—"For these, as for other tombs, candles are required, some water, and provisions may also be taken," in other words, there might be an error on the guide's part, and imprisonment followed. Torches are now often employed instead of candles, but when the light is flickering it is impossible to appreciate the sculpture on the walls. Thanks to M. MASPERO, it will henceforth be almost as easy to study the great scenes as the pictures in any public gallery. There will be also more satisfaction felt by timid people who in such a place are prone to imagine they may be forgotten and immured. The electric light has been introduced, and the intaglios and coloured works are seen under different conditions. Antiquity and modernity are consequently now combined in the Kings' Tombs, and the circle so often suggested by the serpent with its tail in its mouth is once more completed.

THE BRUSSELS CONGRESS OF HYGIENE.

THERE is much about Belgium which has interest for the sanitarian. Wherever men congregate there are dangers to health, and Belgium is in proportion to area the most populous country in Europe. It is one, moreover, that lends itself to statistical tests in a remarkable way. It began its separate existence in 1830, a year which many consider to be the opening of the modern era. Then it contained a population of about four millions, or 323 per square mile. At the close of 1899 the population had increased to 6¼ millions, which gave a density of 593 per square mile. In England and Wales the population was 558 per square mile at the last census, in Scotland it was 150, and in Ireland 140 per square mile. The figures will become more remarkable if we remember how few foreign immigrants seek a home in Belgium if compared with those who drift to this country. We possess also some aids to health which are absent in Belgium. There are only about forty miles of coast line. The mountains, or rather high lands, are not extensive, and, indeed, the traveller is generally struck by the flatness of the surface. The land is cultivated up to the edges of the railways and roads, for only in very limited districts is the wildness of nature tolerated. Industry flourishes to an extraordinary extent. Throughout the country self-preservation has enjoined the necessity for sanitary regulations, and economy dictates the study of sanitary science. For example, during the last ten years no less than 10,000,000 frs. have been expended on the destruction of cattle in order that tuberculous diseases might not be transmitted to man. Many bacteriologists now tell the Belgians the money has been wasted, for transmission is almost an impossibility. The Belgian taxpayer does not grumble at so costly an experiment, but he is resolved that henceforth money shall not be expended until he has acquired some certainty that it will gain the end sought after. On that account the international congress of hygiene held in Brussels between September 2 and 8 was assured of a welcome. It has also to be noted that the first of the international congresses took place in Brussels in 1852, for Belgium resembles Switzerland in being a territory where men of all races, professions and views can meet without any apprehension of molestation.

At the congress just held there were representatives of Great Britain, France, Germany, Austria, Hungary, Italy, Spain, Holland, Switzerland, China, Japan and Mexico. The proceedings were opened with a speech by Prince ALBERT, a nephew of the King, in the course of which he said that although laws might do much to affect sanitation their efficacy was limited. It must be found not only in codes but in the customs and ways of a people. An active and tenacious propaganda should be accepted by which the practice of hygiene should be promoted by pen and speech, but especially by works. A discourse was next delivered by M. BECO, the president, who is also principal secretary of the department of agriculture. In a country like Belgium, where fear of interference with the liberty of the subject is exaggerated, it becomes a difficult question whether sanitation should be secured by legal coercion or by the slow growth of public opinion. As the congress was sure to be on the side of the latter it was considered a welcome aid by the Belgian Government. M. PUTZEYS, the secretary, was able to announce that there were 1,900 members of the congress, of whom 500 were official delegates.

It is not possible to follow the proceedings of all the sections, however interesting. One of the earliest resolutions related to the purification of water, especially when found in sewers, including water from factories. In England the absence of an effective remedy is too well known. It was recommended that the study of the subject should be continued by municipalities or individual sanitarians acting independently or in a combined effort. That was a suggestion for neighbouring communes to co-operate. As we have said, it is not to be expected that the Belgian legislature would act promptly on the conclusions or recommendations of any congress. Indeed, there had to be limits to the discussions, and the resolutions were expressed in the most general terms. It was recognised that the work of the congress was only tentative. For instance, it had been agreed at two congresses elsewhere

that eight hours should be considered as the maximum duration of a day's labour, and especially when women and children were employed. A Belgian physician moved that the sanction of the Brussels congress should be also given to the proposal. But the question was set aside. Another economic difficulty arose in the same section, that of industrial and professional hygiene. Mining is one of the most important industries of the country, for there are about 120,000 people engaged in it. It was arranged that the subject of Ankylostomiasis, a disease to which miners are liable, should be discussed. Some of the speakers wished that there should be an immediate intervention of authority whenever a case occurred. It was also suggested that special courses for such diseases be opened in the medical schools of the universities, and so on. One of the directors of a large mining company explained the measures taken to combat the infestation. At first the workmen, he said, were willing to submit voluntarily to the regulations, but afterwards a reaction took place. Since the miner found that they were entitled to receive compensation they became utterly indifferent to precautions. Some doctors stated that simple remedies were available, but it was generally agreed that cleanliness was always four effectual. To a visitor the discussion revealed the impediments to be overcome in all efforts to deal with the working classes of Belgium, and it is left doubtful whether the congress is favourable or the reverse to State interference in mines.

A paper by Mr. KENDAL, an English geologist, gave rise to a long discussion concerning waters in which chalk lime was found. It was recognised that only through long and careful studies by specialists was it possible to discover whether the source of supply would yield a chalky water. A few experts explained what they had done in preparing reports, from which it became evident that costly experiments would have to be undertaken, and that delays would be unavoidable. An Italian representative declared that water derived from chalky formations was largely employed in Italy. It was found to be excellent and remarkably free from bacteria. If water of the kind were condemned a vast number of people would have to suffer. M. PUTZEYS pointed out that general conclusions on the subject were not philosophic, for water was most capricious in quality. In some cases it might be possible to adopt means of purification at the source, but filtration alone was insufficient. The most practical result that could be drawn from the discussion was that it would be an advantage to establish some central bureau where questions of water supply could be investigated, and from whence local authorities could obtain advice whenever needed.

The subject of the destruction of refuse gave rise to another discussion *à propos* of a report by Mr. ROECHER of Leicester, and others. The general experience related, was in favour of the employment of furnaces for incineration. The system was adopted in Brussels and other continental cities. A report was also read on heating and ventilation of private and collective dwellings from a central station. M. HEYNINX, the chief architect of civil buildings, described a new regulator, which by means of rarefied air showed temperature at a distance, and said that soon several of the instruments would be installed in the Royal Observatory. The advantage of heating by a central apparatus was explained by M. HALLER, and the method apparently continues to receive attention in Belgian cities. Attention was drawn to the subject of fatigue among workmen. In Munich a tract was published for their use in which advice was given about the choice of a calling. It was suggested that medical men should have authority at all times to enter factories and workshops and to examine the employes. Among the resolutions on the subject were the following:—That a special system should be instituted for the medical surveillance of workmen; that before entering on employment a medical certificate should be produced declaring physical aptitude; that inasmuch as it is difficult to furnish a numerical expression of what constitutes fatigue, it is advisable to make a special study by different methods should be made in various or more trades, and in order to obtain trustworthy results the Governments of various countries should facilitate as largely as possible inquiries relating to fatigue.

Another subject which came up for discussion was

disinfection of waggons serving for the transport of travellers, cattle and merchandise. It was agreed that disinfection was demanded. According to M. LODE, professor of hygiene at Innsbruck, the process of disinfection should be repeated twelve or thirteen times in cattle trucks. It was recommended that all classes of railway carriages should be treated with formaline, the seats, cushions, draperies and carpets being exposed for the purpose, and the action of the vapour lasting for seven hours. Some speakers maintained that as yet there were no effectual means of disinfection, but eventually systematic treatment which would facilitate cleaning and disinfection was advocated, and that it should be performed as often as possible. Trains for pilgrims or those which served temporarily for sanatoria should be operated on after each voyage. A delegate from Roumania explained how disinfection was practised in that country. A radical treatment with potash and chloroformal was in use twice a year. There was also disinfection every time there seemed to be a necessity for it. In all the railway stations and depôts medicines and instruments for first aid were to be found. In that way Roumania is ahead of more western countries.

Belgium differs from most continental countries in lending money for the erection of workmen's dwellings. More than a hundred millions of francs have been borrowed, and by means of the money 30,000 families, or 2 per cent. of the population, have secured dwellings. About fifty millions have been granted to 153 societies. The loans were made, however, only to workmen, and the most necessitous class has yet to be provided for. Much requires to be done in Belgium in order to secure sanitary conditions. A burgomaster has the right to prohibit the use of a building which he considers insalubrious unless the owner will carry out the remedial works which are necessary. But that right is seldom exercised owing to the influence of the councillors. The example of Holland was recommended to be followed. There every commune has its inspectors, who have to be assured of the sanitary condition of all houses. There are certain by-laws relating to construction which must be followed. In case the regulations are not carried out the communes have the right to take possession of the property under certain restrictions. A description was also given of the English system, and so favourably considered, it was decided to print and distribute a report on the subject. It was also recommended that facilities should be granted for the acquisition by the working class of suitable dwellings at a cheap rate, that measures should be adopted to ameliorate the lodging of the necessitous classes, and to secure the salubrity of habitations sanitary inspectors should be appointed who are to be independent of the local authorities. It was considered to be more important to immediately render salubrious the dwellings now occupied by the poor than to erect new houses. Sanatoria were not overlooked by the conference, which were considered to have a preventive as well as a curative object. Dr. GRYNs considered that much depended on the selection of the site, and a prolonged observation lasting two years at least was necessary. It was considered to propose that before the selection of a site the constitution of the soil, the drainage of the district and other characteristics should be taken into account. The erection of sanatoria in the neighbourhood of towns in tropical colonies, where there is a risk of malaria, was also suggested.

Several other questions were treated, but they would only have a remote interest for our readers. Much was said, for example, about the statistics of suicides; but it is believed that owing to the difficulty of information it is impossible to realise all the causes. According to one expert, the tendency was most marked in the spring, the period when human activity was strongest. Another speaker pointed out that strikes also were so frequent in the spring their periodicity could be considered as constant. In England strikes have occurred in all seasons. Perhaps more attention is bestowed on statistics in this country and there is a less general desire to compel them to become laws for the formulation of general laws. The work of the International Congress admits of local peculiarities, but there is no doubt the proceedings seem destined to lead to a more general recognition of sanitary laws in all countries. As no universal language is recognised, the proceedings are

not always as easily conducted as is desirable. But a comparison of what was said in 1852 in Brussels with the recommendations of this week and last, will prove that in half a century there has been unquestionable progress.

DAVID D'ANGERS.

ANYONE whose name stands at the head of one of BALZAC's masterpieces may be supposed to have some certainty of renown. That was not the only distinction which PIERRE JEAN DAVID gained through literary men. No artist of his time received as many dedications. VICTOR HUGO inscribed his poem on sculpture with DAVID's name. On the other hand, the claims of the sculptor to the gratitude of writers were undeniable. He appeared to have considered it as his mission to perpetuate their portraits by a material that would be more durable than canvas. Nor was his eagerness confined to his countrymen. On one Sunday evening in March 1830 GOETHE received an immense packing-case from Paris. When it was opened he found to his great delight that it contained no less than fifty-eight portraits in relief of such celebrities as PROSPER MÉRIMÉE, VICTOR HUGO, ALFRED DE VIGNY, EMILE DESCHAMPS, SOPHIE GAY, Madame TASTU and many others. No present could be more acceptable to the German poet, and he acknowledged that it was a provision for many happy days. DAVID afterwards modelled a great bust of GOETHE, which is now in Weimar, and another of RAUCH, the sculptor.

The number of portraits executed by DAVID is almost incredible. It has been calculated that he was the sculptor of more than a hundred large busts and nearly six hundred medallions. It is well to remember that the majority of those were loving labours, for which he expected no other reward than the consciousness of producing memorials of great men, and to have his name associated with theirs. But his large works are no less surprising for their quantity. He filled the pediment of the Panthéon with a collection of figures of representative Frenchmen supposed to be receiving laurel crowns from the hands of France. All of his works have distinct characteristics which are enough to suggest that he expressed his own ideas instead of imitating more or less his predecessors.

Although he has left so large a legacy, it must be admitted that DAVID does not hold in modern times the position he anticipated. A curious prejudice which is injurious to him has arisen. His addition of the name of his birthplace to his name has been interpreted as if he claimed a territorial possession like a prince or a noble. But the explanation of it is very simple. He worked in the atelier of DAVID of the "blood-stained brush," and looked upon him, like most of the young artists of his day, as a demi-god. In order that there might arise no confusion between the two artists he added an appellation which could not be mistaken, for, all Frenchmen, if not the remaining inhabitants of the world, were presumed to be aware that the revolutionary painter who voted for the execution of LOUIS XVI., who was a favourite of NAPOLEON, who died in exile, and whose remains were not allowed a burial place in France, was a native of Paris. With no less willingness JEAN DAVID would have appended "le petit" to his name if he imagined that would have prevented a misidentification of the two.

He was born in Angers in 1789, and could therefore consider himself as a child of the Revolution. He was faithful to its principles until his death in 1856, and on that account was looked upon askance in official circles. His father was a carver in wood, and modelling was consequently familiar to DAVID from his earliest years. But there existed another influence. His father became a revolutionary soldier, so his wife and child were allowed to follow the troops. In that way there was some resemblance between him and VICTOR HUGO. Both possessed a virile spirit that sometimes came near to extravagance. When the war, to some degree, was diminished in fury it was expected that the boy would enter into a business in which he could help his parents. His father was not successful, and when the son wanted to become an artist he pleaded his own example to deter him from that course; but the boy's resolution prevailed, he joined the school of

art at Angers and pursued its courses. When he reached eighteen he went to Paris with only a few francs in his pocket. He endured privations similar to those of hundreds of young artists, but he gained admission among the pupils of DAVID, the painter, and ROLAND, the sculptor, and that was sufficient compensation. He was awarded a medal, and in 1809 was allowed to compete for one of the Roman prizes. His namesake exerted his influence, and it was successful in one way, for the town of Angers allowed him a pension of 600 francs. That encouraged him and he gained a second prize in 1810, and in 1811 he received what is now known as the Grand Prix.

In Rome his efforts attracted the attention of CANOVA, who was then recognised as the greatest of European sculptors. But gratitude for the kindness could not take the form of imitation. DAVID was astonished by so much grace, but the inherent revolutionary spirit compelled him to rebel against mythology, as if it were part and parcel of the system which had been overthrown in France. It is true there were classic figures produced by his master DAVID, but they were of a different kind to the Graces, Hebes and Dancing-Girls of CANOVA. The languor, voluptuousness and morbidez then characterising sculpture had no charm or temptation for the young artist. He remained in Rome fitting himself for the creation of work in keeping with the French spirit of that time. But when he returned to Paris he found his occupation was gone. NAPOLEON had been overthrown, and with the restoration of the monarchy he anticipated a resuscitation of a style of sculpture which he scorned. He resolved to seek his fortune in England. Unfortunately he failed to gauge the extent of our insular prejudices. EDMUND BURKE, with all his philosophy, had worked himself into a state of frenzy over the excesses of the French Revolution, and there was still a belief that unless all Europe was steadfast in opposing France, the reign of terror would be renewed and expanded beyond the boundaries. English artists thought that the elder DAVID had done them a wrong by mixing himself up with the Convention, and so little was known about contemporary art in France, they were unable to distinguish between the painter and the sculptor. The gentle FLAXMAN was not free from prejudice against his forlorn brother artist. Some influential personage considered it would be a good joke if DAVID executed a Waterloo memorial which was then in contemplation. But that was adding insult to neglect, and he sadly returned to Paris.

Fortune was more favourable to him than he had anticipated. The new Government could hardly be altogether inimical to art, and it was judged politic to demonstrate that all the heroism of France did not begin with the fall of the Bastille. He received a commission for the statue of the great CONDÉ which was to be placed on the Pont Louis XV., but is now in the court of the Palace of Versailles with other works of the sculptor. Angers ordered statues for one of the churches.

The Revolution of 1830 revived the decree passed in 1791 for the completion at once of the Panthéon as a secular building. He obtained the commission for the sculpture of the pediment. It is always difficult to fill a triangular space. In the centre DAVID introduced a figure of France clad in Classic costume, crowned with stars and holding a wreath in each hand. Sitting on one side of the dais is History recording the names of the great men, and on the other Liberty is presenting to France the wreaths for bestowal. On one side are the civil representatives, such as MALESHERBES, MONGE, CARNOT, DAVID the painter, CUVIER, &c. Then, as the space decreases, are seated figures of VOLTAIRE and ROUSSEAU. Nearer the angle are youths seated on the ground studying, as well as BICHAT, the anatomist, who in dying lays a manuscript on an altar. A similar arrangement is adopted on the opposite side, which was assigned to arms. NAPOLEON is the only portrait, and he wears the uniform of one of the generals of the revolutionary forces. Near him are types of the soldiers of the army, and the drummer boy. BARRA is included. We then see a dying cuirassier, and finally students of the Military School with instruments of war. The grouping is varied, but the masses of figures are balanced in such a way as to suggest architectural decoration. He executed a frieze 100 feet in length which was

intended for the Place de la Bastille, but by another decree the well-known column of July was set up, and DAVID's work found its way to Marseilles and has been introduced in the Porte d'Aix. He had no share in the decoration of the Arc de l'Etoile, although he would have been proud of a commission. However, to give a list of his statues would occupy more space than could be afforded.

He is not to be tested by a classic standard. Like PUGET he believed in strength, and preferred to represent manly figures. He might be considered as one of the first representatives of modern realism. No painter could be more productive, and his works are known not only in France, but elsewhere in Europe and in America. There is a great difference between his work and that of his contemporary, PRADIER. With the latter we observe a survival of Greek influence, but DAVID suggests the restlessness and the desire for independence which characterised his early days. In the poem addressed to him VICTOR HUGO exclaimed—

La forme, ô grand sculpteur, c'est tout et ce n'est rien !
Ce n'est rien sans l'esprit, c'est tout avec l'idée !

And both mind and ideas are to be found in the masterpieces of DAVID.

M. SALMSON, the sculptor, says, in his Memoirs, he was attracted to the art by seeing some of the medallions of DAVID. He wished to become one of his pupils, but was rejected. He describes DAVID as small, and not handsome, in a coat that was buttoned up to the chin, and which gave him a sombre appearance. He compares his fingers to the spurs of cocks, they were at once so bony, delicate and strong; and when he corrected the exercises of the students at the Ecole des Beaux-Arts the clay seemed to be transformed as soon as he touched it, as if his fingers were steel instruments. He did not hesitate to correct defective contours in drawing by marking a different one with his nail. When competing for the Prix de Rome M. SALMSON became so dissatisfied with his model that he destroyed it. That was a crime, according to the rules of the Académie, which entailed not only the loss of position for the year, but exclusion from competition the following year, besides a public reprimand. At the suggestion of his master he made an appeal to each academician in turn. DAVID spoke to him from the door of his studio, which he could not enter, and told him that although personally he approved of what was done by M. SALMSON—for it showed respect for an ideal—yet officially he had to condemn it. It was necessary to make examples, and two students had been excluded for ever for a lesser offence. However, when the time came the culprit was let off very leniently, and he discovered that the clemency was mainly owing to DAVID.

It is possible that sculptors may arise who will excel DAVID D'ANGERS by the beauty of their works, but it is doubtful whether another will be found who had a similar ambition to secure for posterity enduring records of the greatest of his contemporaries. Perhaps there will be no necessity for such an artist, for some extension of photography or other scientific process will enable medallions to be produced which will be supposed to meet the demands of the future. DAVID thought little of a journey to London if he could see WALTER SCOTT, or to Italy to have a glance of BYRON, or to Athens to meet with some of the heroes of the War of Independence. It is to be hoped people will value his gifts, but DAVID D'ANGERS must have had the satisfaction of gratifying a conviction which had all the power of an instinct.

THE MANCHESTER INFIRMARY COMPETITION.

A "LIFE TRUSTEE" has sent the following letter to the *Manchester Guardian*:—

Designs are now being obtained for the new infirmary proposed to be erected opposite Whitworth Park. Twelve architects have been invited to prepare designs, and it is stated that each is to be paid 100*l.*—1,200*l.* in all.

If the Board, before incurring this reported expenditure had placed themselves in communication with the Corporation of Manchester they would have ascertained that in the recent chief fire station competition the Corporation paid 300*l.* and for the technical school 325*l.* in premiums. In both cases some

twenty to thirty designs were submitted by prominent architects from all parts of the country. Both these buildings are more complex and technical in planning and construction than an infirmary. Anyway, the three buildings may be placed on a level as concerns expert requirements.

If the infirmary Board had offered similar premiums they would have obtained some twenty or thirty or more designs from the best men, as the proposed buildings will be so extensive and prominent that every architect who has had experience in this class of work would have been tempted to compete.

The Board by their unfortunate policy have therefore involved the institution in a probable loss of about 800*l.* without obtaining any advantage in return whatever, and they have, moreover, prevented a large number of experienced architects willing to compete from doing so, obviously to the direct injury of the institution whose interests they are expected to safeguard.

The Corporation system tempts the best brain power available and keeps the preliminary expenditure within reasonable limits.

The choice of architects invited to compete has been crude in the extreme. Thirteen in all are concerned—twelve competitors and one assessor. Three of the thirteen are Glasgow men. Two or three years ago the Glasgow authorities required plans for a large infirmary of 1,200 beds, and plans prepared by Messrs. Schultz & Howard, of London, were selected. Everyone would naturally expect that these architects would receive a pressing invitation to compete for the Manchester infirmary, and that the Glasgow architects, either unwilling or unable to provide their own city with suitable plans, would have been passed over. But the reverse is the case. Messrs. Schultz & Howard (whose plans may be seen at the reference library) are not competing, and of three Glasgow architects two are competitors and one is the assessor.

Precisely the same want of consideration has occurred with reference to Manchester architects. In 1896 the late Board arranged a competition for an infirmary to be erected on the present site. Most of the unsuccessful Manchester architects on that occasion have been asked to compete a second time, instead of others being offered an opportunity of doing so. One would have expected the Board to argue as follows:—Those invited to compete in 1896 having been tried and found wanting, preference, or at least opportunity, should now be given to others. But the natural course is precisely the one that has not been adopted. Several of those who failed in 1896 have received a second invitation, and other architects desirous of competing have been rebuffed.

The attention of the Board has been drawn to their mistaken policy, and it has been pointed out to them that without in any way disturbing arrangements already made, it was still open to them to obtain a larger number of designs from Manchester architects; but at a Board meeting held only a week ago the original policy was reaffirmed by a unanimous vote. The Board consists of twenty-five members, and one wonders why a vote the direct result of which is so detrimental to the interests of the infirmary should be unanimous.

In due course the designs for the proposed new infirmary will be exhibited. Trustees and the public will know that a large proportion of the competitors (if not a majority) have failed in similar competitions, that successful competitors are conspicuous by their absence, and that local architects desirous of competing have not been allowed to do so.

There is no valid reason why the unanimous decision of last week's Board meeting should not be rescinded. The interests of the infirmary make it most desirable that it should be reconsidered.

Not only should all local architects desirous of competing be invited to do so, but the successful architects of the great Glasgow hospital should be directly encouraged to submit designs.

RESTORATION OF SCOTTISH CATHEDRALS.

A CORRESPONDENT of the *Scotsman* writes:—The work of restoring our Scottish cathedrals, which has been going on prosperously for some years, naturally awakens the interest of many people who do not belong to the Church of Scotland. The somewhat perplexing question as to the ultimate end of these restorations perpetually presents itself. In so far as the movement is æsthetic, it is intelligible and praiseworthy. Several of these cathedrals had been horribly deformed by the persons into whose hands they fell after the Reformation. They were sometimes split into two or three separate chapels. In most cases they were blocked up with hideous galleries—or "lofts," as our forefathers appropriately called them—and the area was filled with pews, whose torturing narrowness kept the congregation awake during intolerably long sermons, and whose doors could be banged with a triumphant sigh of relief when the sated worshippers, along with their "dowgs," rushed out of the House of God. In so

far as restoration means the abolition of ugliness and discomfort, it deserves the highest praise.

But it cannot have escaped observation that the work of cathedral restoration in Scotland has gone far beyond this. In every case there has been an attempt (with certain obvious omissions, such as the reproduction of shrines and altars) to make the interior of each cathedral exactly what it was in pre-Reformation days. I do not offer an opinion on the intrinsic desirability of such a transformation. I only ask in what respect it is compatible with the spirit, the doctrinal tenets and the modes of worship which are characteristic of Presbyterianism. I can understand the propriety of a Scottish cathedral being restored and then made over to the State as a national monument. I can also see how a cathedral so restored, if it passed into the possession of the Roman Catholic Church, to which it originally belonged, would be fully utilised by the celebration of imposing rites and by forms of worship which have never changed.

But a Presbyterian cathedral is a curious and illogical conception. Without a bishop, without the mass, without the devotions and ceremonies of the Catholic Church, and without the benediction and authorisation of the Pope (for mere Anglican Episcopacy is no more concerned here than Presbyterianism), the cathedral, when architecturally restored, is only a correctly articulated skeleton.

Is it wonderful that, in view of these facts, many people both within and without the Church of Scotland are asking why, in cathedral restoration, there is such a desperate effort to reproduce church interiors entirely incompatible with plain Presbyterian worship? In these restored buildings everything is sacrificed to effect. The acoustics are deplorable. The pulpit, which with Presbyterians is the main article of church furniture, is so placed that the preacher is frequently invisible and generally inaudible. The effect of the worship, which consists of long prayers without responses, is depressing and incongruous. Now, this need not be the case, even in a cathedral. There is a simplicity and directness in Presbyterian forms of worship very dear to the majority of Scotsmen. These are points that ought never to be lost sight of in the restoration of our ancient churches. They are no longer cathedrals in the real sense of the term, and their interiors, while freed from whatever is unsightly, should never be modified in such a way as to destroy the sense of congregational unity, or to suggest that Protestantism, and especially Presbyterianism, must perforce strive after a distant and pitiable resemblance to an ancient discipline and ritual with which they have nothing in common.

SUSSEX ARCHÆOLOGICAL SOCIETY.

THE autumn meeting of the Sussex Archæological Society was held on Tuesday at Cuckfield, embracing an excursion around the picturesque district of Slaughtam and Bolney. The members taking part in the meeting numbered about 120. The following report of the proceedings is taken from the *Sussex Daily News*:—

Cuckfield Parish Church.

The party drove to Cuckfield, the first visit being made to the Cuckfield parish church, the most interesting features of which were described by the Rev. Canon Cooper, vice-president of the Society and Vicar of Cuckfield. The church was founded by William de Warrene, on what was then a clearing in the forest. It was before the eleventh century served by the monks of Lewes Priory, and in 1250 St. Richard of Chichester appointed his chaplain as the first vicar of Cuckfield. The tower and south wall were indicated as ancient portions of the building, the architectural features of which ranged from Early English to the Perpendicular periods. The roof was of the time of Henry VII, and was interesting as bearing the badges of the Nevills. The roof was restored and decorated by Mr. C. E. Kempe, in 1865. The double stoup was an interesting feature, and the font was of the thirteenth century. The Rev. Canon Cooper described the remarkable series of Burrell monuments on the south wall—including a specimen of Flaxman's work—extending over a period of 350 years. A brief account of the Burrell family, their association with Holmstead, in Cuckfield parish, as ironmasters, was an interesting chapter of local history. The monuments in other parts of the church introduced the Sergison family, associated with the parish for several centuries. The large figure in the chancel was a Sergison monument over which, it appears, there was some parish revolt at the time of its erection. Two of the oldest registers of the church—bearing the Burrell arms on them—were displayed in the tower as interesting curiosities, also a 1636 pewter and other church plate. The charter for a market at Cuckfield granted by Charles II. was also shown.

Cuckfield Park.

The party then walked to Cuckfield Park, the Sergison mansion, now in the occupation of Mr. L. Breitmeyer. The

stately avenue and the ivy-covered clock tower were much admired, and the photographers of the party were busy, the light being the best of the day for photographic work. The oldest portion of Cuckfield House was built by Henry Bowyer in 1574, in the form of the letter "E," the initial of Elizabeth, the reigning sovereign. It was added to and brought to its present shape about fifty years ago. The Rev. Canon Cooper briefly explained the features of the mansion, and the courtesy of Mr. Breitmeyer allowed an inspection of the interior of this famous mansion. Its beautiful carved oak work, dated about 1581, was particularly admired, and the old iron firebacks, one of 1579, were interesting examples of an old Sussex industry. The hall, library, dining-room and other rooms, full of old-time treasures, pictures, &c., allied with the luxury of modern times, made an inspection of the mansion most interesting, the upper rooms allowing views over the grand park to the hills, some miles distant. The gardens and views of the well-known lakes added to the charm of the visit, but the romantic Doom Tree seemed to be overlooked, and its traditions were unsung.

A Visit to Slaugham.

After luncheon a long procession of vehicles then conveyed the party to Slaugham, a pleasant drive of some four or five miles, along a beautiful route, passing Holmstead, the old seat of the Burrell ironmasters, and Staplefield Common. At Slaugham Church the visitors were full of admiration for a new lych gate now being erected as a memorial to the late Mr. W. H. Loder, J.P. The gate promises to be one of the most handsome lych-gates in Sussex. The Rev. A. H. Boyd welcomed the party at Slaugham Church. Mr. P. M. Johnston here described the architectural features and the periods represented. The square font of late Norman work was particularly interesting. On one panel there is the representation of a fish. The special features of Slaugham Church were the Covert brasses and monuments, dating from 1503 to 1586. Mention was made of Mediæval wall-paintings which had disappeared, but as there was some doubt as to their genuineness the loss was not so great as might otherwise have been the case. A piece of oak panelling on the north wall was described as of exceptional interest, and the carved pulpit was evidently an importation from the Continent. Mr. Johnston, in Slaugham Church, raised a protest against pointing old stonework with Portland cement.

Mr. E. F. Bigg, of the Hyde, Slaugham, added to Mr. Johnston's description several interesting notes. The church was restored in 1861, when many of the windows existed with only plain glass. The oak pulpit was only placed in the church five or six years ago. The Covert chapel used to be a separate building and the Covert tomb was in the chapel. The font was considered a very wonderful piece of work. The fish had something in its mouth, which was considered to represent the piece of money. The visitors then closely inspected the features described. The Covert monuments attracted much attention, and it might be mentioned that the church owes the restoration of the carved work to the late Prebendary Haws, formerly rector of the parish. The Rev. A. H. Boyd exhibited a small silver chalice of the Elizabethan period not now in use. In the churchyard, Mr. E. F. Bigg drew attention to the yew-tree, with a girth of 24 feet 7 inches, which he held to be the largest yew-tree in Sussex. Tradition was that the tree was older than the church, the date of which was 1150.

The Slaugham Ruins.

The next move was to the famous Slaugham ruins, now forming part of the gardens of Slaugham Place, Captain Sergison's house at Slaugham. These wrecks of former grandeur were, of course, of exceeding interest to the archaeologists. The Rev. Canon Cooper here again came forward to enlighten the visitors on the history of the ruins, which are those of a famous old house, that of Sir Walter Covert, who came to Slaugham in the fifteenth century. He held a great deal of property in West Sussex. The house was erected about 1605, the architect being Thorpe, who flourished from 1580 to 1610. Sir Walter Covert did not have very long enjoyment of his house. He died in 1631, and in his will directed his body to be buried in the newly-erected chapel at Slaugham Church. It has become a great question as to what had become of all the Coverts? They suddenly seemed to have disappeared. The Rev. Canon Cooper rather thought he had discovered some clue, having found a letter among the State papers, from King James to Sir Walter Covert, asking him to pay the debts of a relative who lived at Leeds Castle, near Maidstone, and who could not appear at Court owing to his indebtedness. Sir Walter gave his cousin 1,000*l.* to enable him to present a good appearance at Court. Leaving no children he placed his property in the hands of trustees, and Canon Cooper was of opinion that the property of Sir Walter Covert came to an end through the carelessness of his heirs. There were many Chancery proceedings, and the mansion seemed to have been allowed to go to ruin, anybody taking away what he liked.

The only relic seemed to be the grand staircase in the municipal buildings at Lewes, which was taken from the Covert mansion to the Star inn at Lewes.

Some Interesting Relics.

The property was acquired by the Sergison family in 1737, and it now belonged to Captain Sergison. Canon Cooper exhibited a portrait of Sir Walter Covert that had been found in the house of Lord Bath, also a photograph of a picture in the Bodleian Library at Oxford of the ruins in 1780, when there were five of the arches remaining, with interesting details of coats of arms, &c.

Mr. Bigg explained that in the woods above the mansion was a Roman-like conduit which supplied the mansion with water. The pipe only now supplied some cottages.

Mr. P. M. Johnston then claimed attention to the remains of the fireplaces in the ruins, one small oven having particular interest, as it was thought to be an oven specially designed for spice cakes or similar confectionery. The work of the old oven-builders was greatly admired.

The party walked back to Slaugham village, and the vehicles were again requisitioned for a continuation of the pleasant journey to Bolney Church. The stay here was brief.

Bolney Church.

Mr. P. M. Johnston briefly described the more interesting architectural features, the pre-Conquest windows in the chancel and the Saxon doorway being the chief attractions to those interested in archaeology. He pointed out the similarity of the Saxon doorway with that in Wivelsfield Church, they being practically identical and the work of the same school of builders. Some of the stones were calcined by fire, showing that at some time the nave had been at the mercy of the flames. He drew attention to the fine piece of oak of which the south door was made, and the parish clerk (Mr. Walder, jun.), showed with pride the huge iron key that opened the Mediæval lock, which was still in working order. In presenting some information as to the church's history, Mr. Johnston amusingly differed from a former rector of Bolney, who took the word "ayell" in certain church documents to refer to the aisle of the church. Mr. Johnston thought it was broad Sussex for "ale," and referred to church-ale, used at certain feasts by which funds were raised for building. The feasts of "cakes and ale" were the forerunners of the modern church bazaar. Mr. Johnston exhibited for inspection a silver chalice date 1567-68, also a linen Communion cloth with figures of saints and a representation of the Lord's Supper woven thereon, the cloth being of German work.

The last stage of the tour was now entered upon in a drive to Cuckfield. The weather became more threatening, and the afternoon was far spent. On reaching Cuckfield, Ockende was visited, the old home of the Burrells, and especially Timothy Burrell, the diarist. The Rev. Canon Cooper gave short history of its ownership.

TESSERÆ.

Frames for Pictures and Engravings.

IF a frame is necessary to a picture, engraving or drawing to isolate it from the objects around it, it is always more or less injurious to the illusion the painter or designer desired to produce, when it occupies its destined place. Gilt frames accord well with large pictures painted in oil, when the latter do not represent gildings, at least so near the frame as to render it easy for the eye to compare the painted gold with the metal itself. There is one instance of a bad effect from such proximity. A Gobelin's tapestry, after Laurent, represents a genius armed with a torch, near which is a gilt altar, executed in yellow silk and wool, all of which are entirely eclipsed by the metallic brilliancy of the gilt bronzes profusely spread over the mahogany frame of the tapestry. This may convince that the richness of a frame may not only be a fault against art but also against common sense. Bronze frames which have but little yellow brilliancy do not injure the effect of an oil picture which represents a scene lighted by artificial light, such as that of candles, torches, a conflagration, &c. When black frames such as ebony detach themselves sufficiently from an oil-painting, they are favourable to large subjects, whenever they are used it is necessary to see whether the browns of the painting or drawing which are contiguous do not lose too much of their vigour. A grey frame is favourable to many landscape scenes painted in oil, particularly when the picture having a dominant colour, we take a grey lightly tinted with the complementary of that colour. Gilt frames accord perfectly with black engravings and lithographs, when we take the precaution of leaving a certain extent of white paper round the subject. To conclude. The rule to be followed in assisting a frame to a picture is, that its colour, brightness, and ornaments also injure neither the colours nor the shadows.

the lights of the picture, nor the ornaments which it represents. When we propose to put a border between the frame and an engraving, plain or coloured, we must take into consideration:—
 (1) The effect of the height of tone of this border upon the different tones of the design. (2) The effect of the complementary of the colour of the border upon the colour of the design. (3) The intensity of the diffused light which is considered most suitable to light the design. Because for a given border the mutual relations between the browns, the half-tints, the lights and the whites change with the intensity of the daylight, and change more for a given composition with certain borders than with others. A composition of small or medium size may be painted so that the artist himself will do well to choose the frame best adapted to it, and to paint up those parts of his picture which are contiguous to it.

The Artist and Nature.

The position of the artist in relation to nature should be continually made clear by the declaration that art, really to be art, should at first withdraw itself from nature, and only in the last accomplishment return to her. The true meaning of this seems to be no other than the following:—In all things in nature the living principle appears only blindly effective; if it were so with the artist he would not be distinguishable from nature itself. If it were his wish consciously to subordinate himself to nature and to repeat things present with a slavish truth, he would produce masks (*larvæ*) indeed, but no works of art. Thus he must remove himself from the result, from the creature, that he may elevate himself to the creative energy and spiritually seize on that. By this means he elevates himself into the region of pure ideas, he forsakes the creature that he may regain it with thousandfold interest, and in this sense certainly to return to nature. The artist should, indeed, above all things imitate that spirit of nature which, working in the core of things, speaks by form and shape as if by symbols, and only in so far as he seizes this spirit and vitally imitates it has he himself created anything of truth. For works which are the result of the mere connection of even beautiful forms would themselves be without all beauty, as that which gives beauty to the whole cannot be form. It is beyond form—it is the essential, the universal, the aspect and expression of the indwelling spirit of nature.

Egg and Tongue.

The egg has been from time immemorial among the ancients the symbol of the being who createth all things and hath all things within himself. It is to be found placed on all the statues of Mithras, upon his altars, and in many ancient votive hands of bronze. Montfaucon has given the representation of a statue of Isis, between the horns of which is placed an egg. The Egyptians also regarded it in profound veneration, and, in conjunction with the serpent, held it as representing the mystery of creation, or the mundane globe, or time and the serpent of eternity. On several of the engraved gems published by Stosch are sculptured two crested serpents, raised upon their tails, with the mystical egg between them. From the Egyptians the egg and serpent's tongue crept into the architectural sculpture of Greece, and forms one of their most elegant ornaments. It is still much used, and called the egg and tongue ornament. It is introduced between the volutes of the Ionic order, and may be traced back, as is done by Quatremere de Quincy, to the head of Isis, to represent a mystical collar or necklace of the mundane egg and the tongue of the serpent of immortality. It is also used in the entablature of the same order with great effect, as in the Erechtheum.

Metaphysical Relations of Painting and Sculpture.

Had no mythology preceded it, art would of itself have arrived at and invented gods. It can also be said that the spirit in its lower developments has a similar relation to matter that the soul has with the body, in that it is the principle of action and movement as matter is of rest and action. The Greek law of moderation in the expression of the passions therefore becomes one flowing from the grounds of its nature is art, but this law applies not only to the lower passions, but also to those more elevated and divine of which the soul is capable in rapture, devotion or in reverence. The gods alone are free from these passions. Art would be attracted from his side also to the production of god-like natures. Painting, however, seems to be quite differently constituted from sculpture, for the former represents not merely by bodily forms, but by light and shade, by an immaterial and in a certain sense intellectual means. It offers its works too by no means as things themselves, and wishes them to be looked upon expressly as pictures. It therefore should not lay stress upon the material in and for itself that sculpture does. It appears from this cause that when elevating the material above the spirit, painting sinks deeper below itself than in a like case does sculpture. On the other hand, it appears with the greater

propriety to give an evident preponderance to the spirit. In instances where painting strives after the highest it will certainly ennoble the passions by character, moderate them by grace, or manifest the power of the soul in them, but those higher passions which depend upon the relation of the soul to a superior being are fully suited to its nature. If sculpture fully weighs that power by which a being exists externally and by which it operates in nature against that by which it operates inwardly and lives as a soul, and thus shuts out mere passivity even from matter, so on the other hand may painting here moderate to the advantage of the soul the character of power and action and change it into that of resignation and patience, through which it appears that man is more fitted to receive the impressions of the soul and general higher influences. From this opposition alone the predominance of sculpture in the ancient and of painting in the modern world explains itself, since the mode of thought in the former was thoroughly plastic, while that of the latter makes the soul the passive organ of higher revelations. If the deviation of plastic into the sphere of painting is an injury to art, so also is the subjugation of painting to the conditions and requirements of sculpture an imposed limitation equally arbitrary.

St. Paul's Cathedral.

The boast and admiration of England is the cathedral church of St. Paul. Its claims to an equality with St. Peter's at Rome, excepting for magnitude, have been advanced. That such a competition will be easily maintained, candour cannot allow, if in examining the objections made by foreigners of taste we find that they are founded in fact as well as supported by opinion. Let us attend to their statement of deficiencies in architectural science discoverable in this grand edifice, not to insist on those which are more dependent on taste. They assert that the essential and visible want of proportion in some of the principal dimensions is extremely derogatory to the praise which has been given to Sir Christopher Wren for his understanding the elegant precision of the antique or even the excellent modern style which existed in his time, and which he was fully enabled to consult and follow. They inquire why the architrave and frieze are omitted above the arcades of the nave and choir, whilst the entablature is complete in every other part of the fabric? Why the summit of the arcade is elevated, as in the Temple of Peace at Rome, above the capitals of the pilasters, for the whole height of the architrave and half that of the frieze? Why has the enormous cupola, which appears to overwhelm the church, a height and exterior circumference so disproportioned to the other dimensions of the edifice? And, lastly, why is the inside surface of the cupola made into an imperfect cone, which throws the pilasters out of their upright and forces them to lean towards the centre? They contend that no similar errors can be detected in the rival temple, nor will they allow the great English architect to emulate the fame of Michel Angelo and his successors in that stupendous structure. As to decoration, which must be suggested and regulated by taste alone, it may be wished that Sir Christopher Wren had not divided the body of the church into two equal orders, instead of adding an attic only, as at St. Peter's, and that he had been more sparing of festoons, which crowd the surface, already broken into minute rustic, to the very summit. Of the façade, and particularly of the two hemispherical porticoes at either termination of the transept, too much cannot be said in praise. The vast cupola, no less than the other parts of the structure in connection with it, when inspected from one of the angular points of the building, acquires a greater harmony of parts, as the extreme length is foreshortened and blends more accordantly with the whole. It is well known that the first design which he gave for this cathedral was more approved by its great author; and it has apparently some advantages over that which was finally adopted, after many interferences and deviations made at the instance of those who directed this sumptuous work. Among other points of superiority may be noticed that the whole fabric consisted of one order only, instead of an equal division into two, and the grand portico projected with a space and elevation not unequal to that of Agrippa added to the Pantheon at Rome.

Manx Churches.

Aisles were not used by Manx church architects, the single exception being the proposed south aisle to the cathedral. This may have arisen from the rudeness of the artists, which rendered a pier and an arch formidable. But may it not also have originated in the quarterland chapels being taken as the models of ecclesiastical architecture? They no doubt had no aisles. The proportion of the churches seems to have been nearly the same—from 60 to 70 feet in length, from 16 to 20 feet in breadth—very much the proportion of the Welsh and Northumberland churches, and, as Petrie proves, of the ancient Irish ones. Apses were unknown—another testimony to the flat end being a principle of the great Irish school of church art. Towers, with the one exception of the cathedral, were not in use.

NOTES AND COMMENTS.

PREHISTORIC structures will not, it is to be hoped, come into fashion and supersede later styles which can claim to have a fair amount of antiquity in their favour. We referred a few weeks ago to a modern lake-dwelling erected in Switzerland. A more curious effort to resuscitate a remote age has been attempted in Budapest. It was decided to commemorate the archæological discoveries in Egypt, Assyria and the Crimea of M. AUGUSTUS SOELER, the president of the Archæological Society of Hungary. For that purpose a temporary banquet hall was raised which represented the subterranean habitations of troglodytes. It should have been excavated, but we suppose the sanitary authorities would have interfered. The walls were adorned with trophies formed of prehistoric lances, javelins, hatchets and other weapons. Some of the courses were served on iron plates or on baked clay which appeared to be ancient, and the toasts were drank out of cows' horns. How far the stewards catered for anthropophagous appetites it would not be polite to reveal.

THE death is announced of Mr. J. M. GALE, who was long connected with the Glasgow Waterworks. The proposal to draw a supply from Loch Katrine in 1855 was considered revolutionary, but the late J. F. BATEMAN, the chief engineer, had acquired a reputation before Parliamentary committees, and the Bill for the purpose became an Act. One of his principal assistants was the late J. M. GALE. According to the *Glasgow Herald* he was a native of Ayr, where he was born in the year 1830. He received his education at the local academy, and coming to Glasgow in 1844 he entered the office of his elder brother, Mr. WILLIAM GALE, who was engineer to the Gorbals Water Company. With the view of extending his knowledge of engineering, he attended Glasgow University, and studied under Professor RANKINE and Professor LAING. While in the office of his brother he was engaged in the designing and construction of the Gorbals Waterworks, which were opened in 1847. For eight years he continued in the position of assistant to his brother, gaining experience which proved valuable to him in his future career. When the Corporation obtained their Act in 1855 for the introduction of the new supply from Loch Katrine, Mr. GALE acted as engineer on the city section of the scheme under Mr. BATEMAN, by whom it was designed and carried out. In 1859, when the works were completed, he was appointed engineer-in-chief, and from that time onwards until the close of last year he had entire charge of the works. The latter years of his life were largely devoted to the construction of a second aqueduct from Loch Katrine, doubling the water supply of the city.

MR. PULLMAN's name is widely known in connection with his luxurious railway carriages which have an effect in improving the ordinary carriage on many English lines. He also endeavoured to bridge over the chasm between capital and labour, but with loss to himself. According to an American paper, it was nearly five years ago that the Supreme Court of Illinois decided that the Pullman Palace Car Company was holding land for other than purely corporate purposes contrary to law, and ordered the company to dispose of its holdings before the end of October of this year. This order compelled the sale of about 4,000 acres underlying the model town of Pullman, together with the many buildings owned by the company and rented to employes or devoted to other uses than the manufacturing of cars. Very little of the land has so far been sold, but there is no intention of evading the order of the Court, and much of the town of Pullman will be forced through the Chicago real-estate market within a short time, where it is certain to bring high prices. This will doubtless mean an extra division of profits on the company's stock. Such is the end of Mr. PULLMAN's fond plan of settling the labour problem. He acted sincerely, but mistakenly, for instead of improving the relations of labour and capital the town of Pullman scheme was instrumental in bringing on one of the sharpest conflicts between the two factors in production ever known. Out of that strike of 1894 grew the legal proceedings which ended in securing against the company an order of sale of the model town.

ILLUSTRATIONS.

ABBOTSFORD, ST. HELEN'S WOOD, HASTINGS.

THIS house is built in a very exposed situation on the south side of a wood overlooking the castle and old town. Every precaution has been taken to meet it by building hollow brick walls with double casements in all rooms on the south and west elevations. The ground floor is faced with random-coursed local limestone of a warm grey colour with Portland stone dressings. The upper portion is hung partly with light brindle, Fontley tiles and half timberwork, the framing throughout being of English oak. The roof is covered with similar but darker brindle tiles. The principal rooms are approached from a large hall which is panelled with oak framing to the frieze. The chief room on the first floor are approached in a similar manner, i.e. entered from an upper hall or large lounge, as a protection from draughts. The work has been entrusted to and well executed by Messrs. SIMMONDS & Co., of Hastings, under the supervision of Mr. FREDK. G. KNIGHT, architect, 13 Victoria Street, S.W.

HOUSE, CLIVE AVENUE, CHURCH STRETTON.

THIS house overlooks the town and the range of hills to the west thereof, including Longmynd, which rises to a height of 1,700 feet, and is almost equally beautifully situated. The estimate for this is 700£.

COMPETITION DESIGN FOR CHURCH, CLERGY HOUSE AND PARISH ROOM, SOUTHEEND-ON-SEA.

THIS design was placed second in the late competition for the proposed new church, clergy house and parish room at Southend-on-Sea, Mr. G. F. BODLEY, R.A. being the assessor. In placing the buildings on the site, flat piece of ground at the top of a slight hill to the south it was thought desirable to join them up into one large block, rather than arranging three separate buildings, not only for the sake of architectural unity and dignity, but also for convenience in use and economy in building. Attention was paid to the position of the clergy house so as to obtain good light and aspect, and convenience of access to the church and parish room without going out of door. On the first floor were provided six bedrooms, dressing-room and offices, and a small oratory at the head of the stairs looking into the chancel. The church itself is a departure from the usual plan, a spacious nave 40 feet wide leading by three arches into a slightly wider chancel, which is divided into choir and chapel by lateral screenwork. The roof principals were intended to be of steel, exerting no thrust and making the roof as light as possible. The materials externally would have been local red bricks, stone dressings and hand-made tiles for roofs. Internally the church was intended to be plastered and whitened with colour decoration on the walls, wooden ceiling, and a high coloured wood dado. All the screenwork would have been richly coloured and decorated together with the fittings, and the walls adorned with pictures. The estimated cost for the structural work was supplied by Messrs. WILLIAM KING & SON, contractors, 3 Vauxhall Bridge Road, S.W., through Messrs. GANDY & BENISON, quantity surveyors, of 22 Essex Street, Strand, W.C. was 12,700£, and the joint authors of the design are Mr. GEOFFREY LUCAS, A.R.I.B.A., and Mr. ARTHUR STRATTON, A.R.I.B.A., both of 2 Vernon Place, Bloomsbury Square, W.C. The drawing of the interior was hung in this year at the Royal Academy Exhibition.

CATHEDRAL SERIES.—EXETER: SYLKE'S CHANTRY, AND CHANCEL OF ST. PAUL.

ST. PAUL'S Chapel and SYLKE'S Chantry open out into the north transept of the cathedral. The former is believed to have been built during the episcopate of Bishop QUIVIL (1280-91). One of the bosses shows St. Paul leaning upon a sword. The chapel is lighted by windows on three sides. Close to it is WILLIAM SYLKE's chantry. It is said to have been sub-chanter of the cathedral, and was buried in 1508. The little chapel originally contained many statuettes, which from time to time were mutilated as well as a figure of the founder, who is represented almost a skeleton in a winding-sheet. Over the arch which shelters it is the inscription:—"Sum q' cris, fuer' q' d. es, p' me precor ora, Will. Sylke."

INDUSTRIAL REQUIREMENTS.*

SOME years ago, in discussing the relations of scientific instruction to our industries, Huxley pointed out that we are in presence of a new "struggle for existence," a struggle which, once commenced, must go on until only the fittest survives.

It is a struggle between organised species—nations—not between individuals or any class of individuals. It is, moreover, a struggle in which science and brains take the place of swords and sinews, on which depended the result of those contests which, up to the present, have determined the history and life of nations. The school, the university, the laboratory and the workshop are the battlefields of this new warfare.

But it is evident that if this, or anything like it, be true our industries cannot be involved alone; the scientific spirit, brain-power, must not be limited to the workshop if other nations utilise it in all branches of their administration and executive.

It is a question of an important change of front. It is a question of finding a new basis of stability for the Empire in the new conditions. I am certain that those familiar with the present state of things will acknowledge that the Prince of Wales's call, "Wake up!" applies quite as much to the members of the Government, as it does to the leaders of industry.

What is wanted is a complete organisation of the resources of the nation, so as to enable it best to face all the new problems which the progress of science, combined with the ebb and flow of population and other factors in international competition, are ever bringing before us. Every Minister, every public department, is involved, and this being so, it is the duty of the whole nation—King, Lords and Commons—to do what is necessary to place our scientific institutions on a proper footing in order to enable us to "face the music," whatever the future may bring. The idea that science is useful only to our industries comes from want of thought. If anyone is under the impression that Britain is only suffering at present from the want of the scientific spirit among our industrial classes, and that those employed in the State service possess adequate brain-power and grip of the conditions of the modern world to which science so largely enters, let him read the report of the Royal Commission on the War in South Africa. There he will see how the whole "system" employed was, in Sir Henry Jackson's words applied to a part of it, "unsuited to the requirements of an army which is maintained to enable us to make war." Let him read also in the address of the President of the Society of Chemical Industry what drastic steps had to be taken by chambers of commerce and "a quarter of a million working men" to get the Patent Law Amendment Act into proper shape in spite of all the advisers and officials of the Board of Trade. Very few people realise the immense number of scientific problems the solution of which is required for the State service. The nation itself is a gigantic workshop, and to make more our rulers and legislators, administrators and executive officers possess the scientific spirit, the more the rule of thumb is replaced in the State service by scientific methods, the more able shall we be, thus armed at all points, to compete successfully with other countries along all lines of national as well as of commercial activity.

It is obvious that the power of a nation for war, in men and arms and ships, is one thing; its power in the peace struggles in which I have referred is another. In the latter the source of standard of national efficiency are entirely changed. To meet war conditions, there must be equality or superiority in navies and army corps. To meet the new peace conditions, there must be equality or superiority in universities, scientific organisation and everything which conduces to increase brain-power.

Our Industries are suffering in the present International Competition.

The present condition of the nation, so far as its industries are concerned, is as well known not only to the Prime Minister, but to other political leaders and out of the Cabinet, as it is to you and to me. We are suffering because trade no longer follows the flag as in the old days, but because trade follows the brains, and manufacturers are too apt to be careless in securing them. The chemical establishment in Germany 400 doctors of science, the best the universities there can turn out, have been employed at different times in late years. In the United States the most successful students in the higher teaching are snapped up the moment they have finished their course of training and put into charge of large concerns, so the idea has got abroad that youth is the password of success in American industry. It has been forgotten that the product of the highest scientific education must necessarily be young, and that it is the training and not the age which determines his employment. In Britain, on the other

From the address delivered by Sir Norman Lockyer as president of the British Association on Wednesday.

hand, apprentices who can pay high premiums are too often preferred to those who are well educated, and the old rule-of-thumb processes are preferred to new developments, a conservatism too often depending upon the master's own want of knowledge.

I should not be doing my duty if I did not point out that the defeat of our industries one after another, concerning which both Lord Rosebery and Mr. Chamberlain express their anxiety, is by no means the only thing we have to consider. The matter is not one which concerns our industrial classes only, for knowledge must be pursued for its own sake; and since the full life of a nation with a constantly increasing complexity not only of industrial but of high national aims, depends upon the universal presence of the scientific spirit—in other words, brain-power—our whole national life is involved.

The Necessity for a Body dealing with the Organisation of Science.

The present awakening in relation to the nation's real needs is largely due to the warnings of men of science. But Mr. Balfour's terrible Manchester picture of our present educational condition shows that the warning, which has been going on now for more than fifty years, has not been forcible enough; but if my contention that other reorganisations besides that of our education are needed is well founded, and if men of science are to act the part of good citizens in taking their share in endeavouring to bring about a better state of things, the question arises, Has the neglect of their warnings so far been due to the way in which these have been given?

Lord Rosebery, in the address to a chamber of commerce from which I have already quoted, expressed his opinion that such bodies do not exercise so much influence as might be expected of them. But if commercial men do not use all the power their organisation provides, do they not by having built up such an organisation put us students of science to shame, who are still the most disorganised members of the community?

Here, in my opinion, we have the real reason why the scientific needs of the nation fail to command the attention either of the public or of successive Governments. At present appeals on this or on that behalf are the appeals of individuals; science has no collective voice on the larger national questions; there is no organised body which formulates her demands.

During many years it has been part of my duty to consider such matters, and I have been driven to the conclusion that our great crying need is to bring about an organisation of men of science and all interested in science similar to those which prove so effective in other branches of human activity. For the last few years I have dreamt of a chamber, guild, league, call it what you will, with a wide and large membership, which should give us what, in my opinion, is so urgently needed. Quite recently I sketched out such an organisation, but what was my astonishment to find that I had been forestalled, and by the founders of the British Association.

The First Work of such an Organisation.

I suppose it is my duty, after I have suggested the need of an organisation, to tell you my personal opinion as to the matters where we suffer most in consequence of our lack of organisation at the present time.

Our position as a nation, our success as merchants, are in peril chiefly—dealing with preventable causes—because of our lack of completely efficient universities and our neglect of research. This research has a double end. A professor who is not learning cannot teach properly or arouse enthusiasm in his students; while a student of anything who is unfamiliar with research methods, and without that training which research brings, will not be in the best position to apply his knowledge in after-life. From neglect of research comes imperfect education and a small output of new applications and new knowledge to reinvigorate our industries. From imperfect education comes the unconcern touching scientific matters and the too frequent absence of the scientific spirit in the nation generally, from the court to the parish council.

I propose to deal as briefly as I can with each of these points.

Universities.

I have shown that, so far as our industries are concerned, the cause of our failure has been run to earth; it is fully recognised that it arises from the insufficiency of our universities both in numbers and efficiency, so that not only our captains of industry, but those employed in the nation's work generally, do not secure a training similar to that afforded by other nations. No additional endowment of primary, secondary or technical instruction will mend matters. This is not merely the opinion of men of science; our great towns know it, our Ministers know it.

Our conception of a university has changed. University education is no longer regarded as the luxury of the rich, which

concerns only those who can afford to pay heavily for it. The Prime Minister in a recent speech, while properly pointing out that the collective effect of our public and secondary schools upon British character cannot be overrated, frankly acknowledged that the boys of seventeen or eighteen who have to be educated in them "do not care a farthing about the world they live in except in so far as it concerns the cricket-field or the football-field or the river." On this ground they are not to be taught science; and hence, when they proceed to the university, their curriculum is limited to subjects which were better taught before the modern world existed or even Galileo was born. But the science which these young gentlemen neglect, with the full approval of their teachers, on their way through the school and the university to politics, the Civil Service, or the management of commercial concerns, is now one of the great necessities of a nation; and our universities must become as much the insurers of the future progress as battleships are the insurers of the present power of States. In other words, university competition between States is now as potent as competition in building battleships, and it is on this ground that our university conditions become of the highest national concern, and therefore have to be referred to here, and all the more because our industries are not alone in question.

Why we have not more Universities.

Chief among the causes which have brought us to the terrible condition of inferiority as compared with other nations in which we find ourselves are our carelessness in the matter of education and our false notions of the limitations of State functions in relation to the conditions of modern civilisation.

Time was when the Navy was largely a matter of private and local effort. William the Conqueror gave privileges to the Cinque Ports on the condition that they furnished fifty-two ships when wanted. In the time of Edward III., of 730 sail engaged in the siege of Calais 705 were "people's ships." All this has passed away; for our first line of defence we no longer depend on private and local effort.

Time was when not a penny was spent by the State on elementary education. Again, we no longer depend upon private and local effort. The Navy and primary education are now recognised as properly calling upon the public for the necessary financial support. But when we pass from primary to university education, instead of State endowment we find State neglect; we are in a region where it is nobody's business to see that anything is done.

We in Great Britain have thirteen universities competing with 134 State and privately endowed in the United States and twenty-two State endowed in Germany. I leave other countries out of consideration for lack of time, and I omit all reference to higher institutions for technical training, of which Germany alone possesses nine of university rank, because they are less important; they instruct rather than educate, and our want is education. The German State gives to one university more than the British Government allows to all the universities and university colleges in England, Ireland, Scotland and Wales put together. These are the conditions which regulate the production of brain-power in the United States, Germany and Britain respectively, and the excuse of the Government is that this is a matter for private effort. Do not our Ministers of State know that other civilised countries grant efficient State aid, and, further, that private effort has provided in Great Britain less than 10 per cent. of the sum thus furnished in the United States in addition to State aid? Are they content that we should go under in the great struggle of the modern world because the Ministries of other States are wiser, and because the individual citizens of another country are more generous than our own?

If we grant that there was some excuse for the State's neglect so long as the higher teaching dealt only with words, and books alone had to be provided (for the streets of London and Paris have been used as classrooms at a pinch), it must not be forgotten that during the last 100 years not only has knowledge been enormously increased, but things have replaced words, and fully equipped laboratories must take the place of books and classrooms if university training worthy of the name is to be provided. There is much more difference in size and kind between an old and a new university than there is between the old caravel and a modern battleship, and the endowments must follow suit.

What are the facts relating to private endowment in this country? In spite of the munificence displayed by a small number of individuals in some localities, the truth must be spoken. In depending in our country upon this form of endowment we are trusting to a broken reed. If we take the twelve English university colleges, the forerunners of universities unless we are to perish from lack of knowledge, we find that private effort during sixty years has found less than 4,000,000*l.*; that is, 2,000,000*l.* for buildings, and 40,000*l.* a year income. This gives us an average of 166,000*l.* for buildings, and 3,300*l.* for yearly income.

What is the scale of private effort we have to compete in regard to the American universities?

In the United States during the last few years universities and colleges have received more than 40,000,000*l.* from private source alone; private effort supplied nearly 7,000,000*l.* in the years 1898-1900.

Next consider the amount of State aid to universities afforded in Germany. The buildings of the new University of Strasburg have already cost nearly a million; that is, about as much as has yet been found by private effort for building in Manchester, Liverpool, Birmingham, Bristol, Newcastle and Sheffield. The Government annual endowment of the German university is more than 49,000*l.*

This is what private endowment does for us in England against State endowment in Germany.

But the State does really concede the principle; its present contribution to our universities and colleges amounts to 155,600*l.* a year. No capital sum, however, is taken from buildings. The State endowment of the University of Berlin in 1891-92 amounted to 168,777*l.*

When, then, we consider the large endowments for university education both in the United States and Germany, it is obvious that State aid only can make any valid competition possible with either. The more we study the facts, the more statistics are gone into, the more do we find that we, to a large extent, lack both of the sources of endowment upon which either, or both, of which other nations depend. We are between two stools, and the prospect is hopeless without drastic changes. And first among these, if we intend to get out of the present Slough of Despond, must be the giving up of the idea of relying upon private effort.

To compete on equal grounds with other nations we must have more universities. But this is not all—we want a better endowment of all the existing ones, not forgetting better opportunities for research on the part of both professors and students. Another crying need is that of more professors at a better pay. Another is the reduction of fees; they should be reduced to the level existing in those countries which are competing with us—to, say, one-fifth of their present rates, in order to enable more students in the secondary and technical schools to complete their education.

In all these ways facilities would be afforded for providing the highest instruction to a much greater number of students. At present there are almost as many professors and instructors in the universities and colleges of the United States as there are day students in the universities and colleges of the United Kingdom.

Men of science, our leaders of industry and the chiefs of our political parties all agree that our present want of higher education—in other words, properly equipped universities—heavily handicapping us in the present race for commercial supremacy, because it provides a relatively inferior type of power, which is leading to a relatively reduced national income.

The facts show that in this country we cannot depend upon private effort to put matters right. How about local effort?

Anyone who studies the statistics of modern municipal finance will see that it is impossible for them to raise rates for building and upkeep of universities.

The buildings of the most modern university in Germany have cost a million. For upkeep the yearly sums furnished chiefly by the State, for German universities of different grades, taking the incomes of seven out of the twenty universities as examples, are:—

First class	Berlin	130,000
Second class	Bonn	56,000
	Göttingen	
Third class	Königsberg	48,000
	Strasburg	
Fourth class	Heidelberg	37,000
	Marburg	

Thus, if Leeds, which is to have a university, is compared with the fourth class German standard, a rate must be levied of 7*d.* in the pound for yearly expenses, independent of buildings. But the facts are that our towns are already breaking strain. During the last fifty years, in spite of enormous increases in rateable values, the rates have gone from about 2*s.* to about 7*s.* in the pound for real local purposes. But no university can be a merely local institution.

How to get more Universities.

What, then, is to be done? Fortunately, we have precedent admirably in point, the consideration of which may lead us to answer this question.

I have pointed out that in old days our Navy was provided by local and private effort. Fortunately for us, those days have passed away; but some twenty years ago, in the midst of a large expenditure, it began to be felt by those who were in power that in consequence of the increase of foreign navies our power was threatened, as now, in consequence of the increase of foreign universities, our brain-power is threatened.

The nation slowly woke up to find that its enormous commerce was no longer insured at sea, that in relation to foreign rivals our own had been suffered to dwindle to such an extent that it was no longer capable of doing the duty which the nation expected of it even in times of peace. At first this relation was received with a shrug of incredulity, and the peace-at-any-price party denied that anything was needed; but a great teacher arose; as the facts were inquired into, the suspicion changed into an alarm; men of all parties saw that something must be done. Later the nation was thoroughly aroused, and with an universal agreement the principle was laid down that, cost what it might to enforce our sea-power, our Navy must be made and maintained of a strength greater than those of any two possibly contending Powers. After establishing this principle, the next thing to do was to give effect to it. What did the nation do after full discussion and inquiry? A Bill was brought in in 1888, and a sum of £500,000 was voted in order, during the next five years, to inaugurate a large shipbuilding programme, so that Britain's commerce might be guarded on the high seas in any event.

Since then we have spent £120,000,000 on new ships, and this year we spend still more millions on still more new ships. These prove insufficient to safeguard our sea-power, there is no doubt that the nation will increase them, and I have not heard that anybody has suggested an appeal to private effort.

How, then, do we stand with regard to universities, recognising them as the chief producers of brain-power, and therefore the equivalents of battleships in relation to sea-power? Do their numbers come up to the standard established by the Admiralty principle to which I have referred? Let us attempt to get a rough-and-ready estimate of our educational position by counting universities as the Admiralty counts battleships. A rough-and-ready, because we have other helps to greater brain-power to consider besides universities, as the Admiralty has other ships to consider besides ironclads.

In the first place, let us inquire if they are equal in number to those of any two nations commercially competing with us. In the United Kingdom we had until quite recently thirteen. These, one is only three years old as a teaching university, another is still merely an examining board.

In Germany there are twenty-two universities; in France, after recent legislation, fifteen; in Italy, twenty-one. It is difficult to give the number in the United States, because it is larger, from the tables given in the report of the Commissioner of Education, that some colleges are more important than some universities, and both give the degree of Ph.D. But of universities in title we have 134. Among these, there are sixty-six with more than fifty professors and instructors, and sixteen with more than 150. I will take that figure.

Suppose we consider the United States and Germany, our two commercial competitors, and apply the Admiralty principle. We should require, allowing for population, eight additional universities at the very lowest estimate. We see, then, that instead of having universities equalling in number those of two of our chief competitors together, they are by no means equal to those of either of them singly.

After this statement of the facts, anyone who has belief in the importance of higher education will have no difficulty in understanding the origin of the present condition of British industry and its constant decline, first in one direction and then another, since the tremendous efforts made in the United States and Germany began to take effect.

If, indeed, there be anything wrong about the comparison, error can only arise from one of two sources—either the Admiralty is thoughtlessly and wastefully spending money, or there is no connection whatever between the higher intelligence and the prosperity of a nation. I have already referred to the words of Mr. Chamberlain and Lord Rosebery on this point; we know what Mr. Chamberlain has done at Birmingham; we know the strenuous efforts made by the commercial leaders of Manchester and Liverpool; we know also the opinion of men of science.

If while we spend so freely to maintain our sea-power our export of manufactured articles is relatively reduced because our competitors beat us in the markets of the world, what is the end of the vista thus opened up to us? A Navy growing larger every year and requiring larger votes to guard our commerce and communications, and a vanishing quantity of revenue to guard—a reduced national income to meet an increasing taxation.

The pity is that our Government has considered sea-power only; that while so completely guarding our commerce it has had no thought to one of the main conditions on which its action and increase depend. A glance could have shown that other countries were building universities even faster than we were building battleships—were, in fact, considering brain-power first and sea-power afterwards.

Clearly it is my duty as your President to point out the danger ahead, if such ignoring of the true situation should be allowed to continue. May I express a hope that at last, in

Mr. Chamberlain's words, "The time is coming when governments will give more attention to this matter"?

What will they cost?

The comparison shows that we want eight new universities, some of which, of course, will be colleges promoted to university rank and fitted to carry on university work. Three of them are already named—Manchester, Liverpool, Leeds.

Let us take this number and deal with it on the battleship condition, although a modern university on American or German models will cost more to build than a battleship.

If our present university shortage be dealt with on battleship conditions, to correct it we should expend at least 8,000,000 for new construction, and for the pay-sheet we should have to provide (8 × 50,000) 400,000 yearly for personnel and upkeep; for it is of no use to build either ships or universities without manning them. Let us say roughly, capitalising the yearly payment at 2½ per cent., 24,000,000.

At this stage it is important to inquire whether this sum, arrived at by analogy merely, has any relation to our real university needs.

I have spent a year in making inquiries, as full as I could make them, of friends conversant with the real present needs of each of the universities, old and new. I have obtained statistics which would fill a volume, and personally I believe that this sum at least is required to bring our university system up to anything like the level which is insisted upon both in the United States and in Germany. Even Oxford, our oldest university, will still continue to be a mere bundle of colleges unless three millions are provided to enable the university, properly so-called, to take her place among her sisters of the modern world, and Sir Oliver Lodge, the principal of our very youngest university, Birmingham, has shown in detail how five millions can be usefully and properly applied in that one locality to utilise for the good of the nation the enthusiasm and scientific capacity which are only waiting for adequate opportunity of development.

How is this money to be raised? I reply, without hesitation, duplicate the Navy Bill of 1888-89; do at once for brain-power what we so successfully did then for sea-power.

Let 24,000,000 be set apart from one asset, our national wealth, to increase the other, brain-power. Let it be assigned and borrowed as it is wanted; there will be a capital sum for new buildings to be erected in the next five or ten years, the interest of the remainder to go towards increased annual endowments.

There need be no difficulty about allocating money to the various institutions. Let each university make up its mind as to which rank of the German universities it wishes to emulate. When this claim has been agreed to the sums necessary to provide the buildings and teaching staff of that class of university should be granted without demur.

It is the case of battleships over again, and money need not be spent more freely in one case than in the other.

Let me at once say that this sum is not to be regarded as practically gone when spent, as in the case of a short-lived ironclad. It is a loan which will bear a high rate of interest. This is not my opinion merely; it is the opinion of those concerned in great industrial enterprises and fully alive to the origin and effects of the present condition of things.

I have been careful to point out that the statement that our industries are suffering from our relative neglect of science does not rest on my authority. But if this be true, then if our annual production is less by only two millions than it might have been, having two millions less to divide would be equivalent to our having forty or fifty millions less capital than we should have had if we had been more scientific.

Sir John Brunner, in a speech connected with the Liverpool School of Tropical Medicine, stated recently that if we as a nation were now to borrow ten millions of money in order to help science by putting up buildings and endowing professors, we should get the money back in the course of a generation a hundredfold. He added that there was no better investment for a business man than the encouragement of science, and that every penny he possessed had come from the application of science to commerce.

According to Sir Robert Giffen, the United Kingdom as a going concern was in 1901 worth 16,000,000,000.

Were we to put aside 24,000,000 for gradually organising, building and endowing new universities, and making the existing ones more efficient, we should still be worth 15,976,000,000—a property well worth defending by all the means, and chief among these brain-power, we can command.

If it be held that this, or anything like it, is too great a price to pay for correcting past carelessness or stupidity, the reply is that the 120,000,000 recently spent on the Navy, a sum five times greater, has been spent to correct a sleepy blunder, not one whit more inimical to the future welfare of our country than that which has brought about our present educational position. We had not sufficiently recognised what other nations had done in the way of shipbuilding, just as until

now we have not recognised what they have been doing in university building.

Further, I am told that the sum of 24,000,000*l.* is less than half the amount by which Germany is yearly enriched by having improved upon our chemical industries, owing to our lack of scientific training. Many other industries have been attacked in the same way since, but taking this one instance alone, if we had spent this money fifty years ago, when the Prince Consort first called attention to our backwardness, the nation would now be much richer than it is, and would have much less to fear from competition.

Suppose we were to set about putting our educational house in order, so as to secure a higher quality and greater quantity of brain-power, it would not be the first time in history that this has been done. Both Prussia after Jena and France after Sedan acted on the view:—

When land is gone and money spent,
Then learning is most excellent.

After Jena, which left Prussia a "bleeding and lacerated mass," the king and his wise counsellors, among them men who had gained knowledge from Kant, determined, as they put it, "to supply the loss of territory by intellectual effort."

What did they do? In spite of universal poverty three universities, to say nothing of observatories and other institutions, were at once founded, secondary education was developed, and in a few years the mental resources were so well looked after that Lord Palmerston defined the kingdom in question as "a country of damned professors."

After Sedan—a battle, as Moltke told us, "won by the schoolmaster"—France made even more strenuous efforts. The old University of France, with its "academies" in various places, was replaced by fifteen independent universities, in all of which are faculties of letters, sciences, law and medicine.

The development of the University of Paris has been truly marvellous. In 1897-98 there were 12,000 students, and the cost was 200,000*l.* a year.

But even more wonderful than these examples is the "intellectual effort" made by Japan, not after a war, but to prepare for one.

The question is, Shall we wait for a disaster and then imitate Prussia and France, or shall we follow Japan and thoroughly prepare by "intellectual effort" for the industrial struggle which lies before us?

Such an effort seems to me to be the first thing any national or imperial scientific organisation should endeavour to bring about.

The Need of a Scientific National Council.

In referring to the new struggle for existence among civilised communities I pointed out that the solution of a large number of scientific problems is now daily required for the State service, and that in this and other ways the source and standard of national efficiency have been greatly changed.

Much evidence bearing upon the amount of scientific knowledge required for the proper administration of the public departments, and the amount of scientific work done by and for the nation, was brought before the Royal Commission on Science presided over by the late Duke of Devonshire now more than a quarter of a century ago.

The Commission unanimously recommended that the State should be aided by a scientific council in facing the new problems constantly arising.

But while the Home Government has apparently made up its mind to neglect the advice so seriously given, it should be a source of gratification to us all to know that the application of the resources of modern science to the economic, industrial and agricultural development of India has for many years engaged the earnest attention of the Government of that country. The Famine Commissioners of 1878 laid much stress on the institution of scientific inquiry and experiment designed to lead to the gradual increase of the food supply and to the greater stability of agricultural outturn, while the experience of recent years has indicated the increasing importance of the study of the economic products and mineral-bearing tracts.

Lord Curzon has recently ordered the heads of the various scientific departments to form a board, which shall meet twice annually, to begin with, to formulate a programme and to review past work. The board is also to act as an advisory committee to the Government, providing among other matters for the proper co-ordination of all matters of scientific inquiry affecting India's welfare.

Lord Curzon is to be warmly congratulated upon the step he has taken, which is certain to bring benefit to our great dependency.

The importance of such a board is many times greater at home, with so many external as well as internal interests to look after—problems common to peace and war, problems requiring the help of the economic as well as of the physical sciences.

It may be asked, What is done in Germany, where science is fostered and utilised far more than here?

The answer is, there is such a council. I fancy very much like what our Privy Council once was. It consists of representatives of the Ministry, the universities, the industries and agriculture. It is small, consisting of about a dozen members, consultative, and it reports direct to the Emperor. It does not deal with industrial war what military and so-called defence council for national armaments; it considers everything relating to the use of brain-power in peace—from alterations in school regulations and the organisation of the universities to railway rates and fiscal schemes, including the adjustment of duties. It is informed that what this council advises generally becomes law.

It should be pretty obvious that a nation so provided with enormous chances in its favour. It is a question of drilled battalions against an undisciplined army, of the use of the scientific spirit as opposed to the hope of "mud and iron."

Mr. Haldane has recently reminded us that "the weapon of science places in the hands of those who engage in the great rivalries of commerce leave those who are without them however brave, as badly off as were the dervishes of Omar against the Maxims of Lord Kitchener."

Without such a machinery as this, how can our Ministers and our rulers be kept completely informed on a thousand things of vital importance? Why should our position as requirements as an industrial and thinking nation receive less attention from the authorities than the head-dress of the Guards? How, in the words of Lord Curzon, can "the vigour and vigour of a nation be summed up before the world in the person of its sovereign" if the national organisation is defective that it has no means of keeping the head of the State informed on things touching the most vital and lasting interests of the country? We seem to be still in the Palæolithic Age in such matters, the chief difference being that the sword has replaced the flint implement.

Some may say that it is contrary to our habit to expect the Government to interest itself too much or to spend money on matters relating to peace; that war dangers are the only ones to be met or to be studied.

But this view leaves science and the progress of science out of the question. Every scientific advance is now, and will be in the future be more and more applied to war. It is no longer a question of an armed force with scientific corps; it is a question of an armed force scientific from top to bottom. The God the Navy has already found this out. Science will ultimately rule all the operations both of peace and war, and therefore the industrial and the fighting population must have a large common ground of education. Already it is looking too far ahead to see that in a perfect State there would be a double use of each citizen—a peace use and a war use—and the more science advances, the more the old difference between the peaceful citizen and the man at arms will disappear. The barrack, if it still exists, and the workshop will be assimilated; the land unit, like the battleship, will become a school of applied science, self-contained, in which the officer will be the efficient teachers.

I do not think it is yet recognised how much the problem of national defence has thus become associated with that which we are now chiefly concerned.

These, then, are some of the reasons which compel me to point out that a scientific council, which might be a sub-committee of the Privy Council, in dealing primarily with national needs in times of peace, would be a source of strength to the nation.

To sum up, then, my earnest appeal to you is to give your loins and see to it that the science of the British Empire shall no longer remain unorganised. I have endeavoured to point out to you how the nation at present suffers from the absence of a powerful, continuous, reasoned expression of scientific opinion, urging in season and out of season that we shall be armed as other nations are, with efficient universities and facilities for research to uphold the flag of Britain in the domain of learning and discovery, and what they alone can bring.

I have also endeavoured to show how, when this is done, the nation will still be less strong than it need be if there be added to our many existing councils another, to secure the even during peace the benefits which a proper co-ordination of scientific effort in the nation's interest can bring shall not be neglected as they are at present.

Let some of you may think that the scientific organisation which I trust you will determine to found would risk success working on such large lines, let me remind you that in 1878 when the late Prince Consort occupied this chair, he referred to "impediments" to scientific progress, and said, "they are such as can only be successfully dealt with by the powerful action of the State or the long purse of the nation."

If the Prince Consort had lived to continue his advocacy of science, our position to-day would have been very different. His early death was as bad for Britain as the loss of a great campaign. If we cannot make up what we have lost we cannot mend.

I have done what I feel to be my duty in bringing the present condition of things before you. It is now your duty, if you agree with me, to see that it be put right. You can if you will.

THE WORK OF THE ART SCHOOLS.

THE following extracts from the reports of the examiners on the results of the art examinations, 1902, have appeared:—

GEOMETRICAL DRAWING.

Examiner: H. W. O. Hagreen.

The average quality of the papers worked at the evening examination was higher than in the corresponding examination last year. There is still evidence that in many classes lectures have not been sufficiently supplemented by supervision and correction of the student's own work.

At the day examination the average of geometrical draughtsmanship was creditable, but hardly so good as in past years. There was the usual evidence that the text-books had been studied, and that a great many students have very little idea of turning their knowledge to any practical account.

PERSPECTIVE.

Examiner: H. Walter Lonsdale.

An improvement is evident in the general quality of the work submitted for the evening examination, as compared with the corresponding one of last year.

This improvement is maintained in the day examination, an ability in readily applying their knowledge of the theory of perspective to the practical solution of problems presented in an unaccustomed form being shown by an increased number of candidates.

FREEHAND DRAWING IN OUTLINE.

Examiners: W. J. Donne and W. Norris, A.R.C.A. (London).

The new conditions imposed this year, viz. "to be finished with a brush or pen," have produced some very satisfactory results.

There is a great variety of brush line and penwork; in some instances a very intelligent rendering is given, and in others in inexpressive, thin and monotonous line.

MODEL DRAWING.

Examiners: Martin A. Buckmaster, A.R.C.A. (London) and John Parker.

The examiners are of the opinion that there is a steady improvement in the standard of merit of the exercises submitted for examination, but the level of the work in the day examination is not so high as that of the evening.

It is gratifying to note that fewer students are now presented without sufficient preparation for the present advanced character of the examination.

DRAWING IN LIGHT AND SHADE.

Examiners: Henry Bayfield and John Somerscales, A.R.C.A. (London).

A fair number of drawings done at the evening and day examinations show careful and good work, but in a considerable number of exercises a falling-off in method is apparent, accuracy of drawing giving place to a looseness and vagueness of execution, which may be suggestive and picturesque, but not calculated to develop a sound knowledge of this subject.

DRAWING ON THE BLACKBOARD.

Examiner: S. J. Cartledge, A.R.C.A. (London), H.M.C.I.

At training colleges a higher average standard of work is naturally to be looked for this year, as no "first year" students were admitted to the examinations; and it is gratifying to report that the exercises generally reached a high level, being quite up to anticipation. In many cases it was quite evident that an excellent course of study had been followed, though here and there unmistakable signs of a wholesome cram in memory drawing were to be seen.

The level of last year is maintained in the work done at schools of art and art classes.

ARCHITECTURE.

Examiner: Professor T. Roger Smith.

The number of candidates was less than last year; the average quality of the work was, however, much higher.

Generally speaking the work, and especially the drawings, made by those candidates who have gained high marks is unquestionably good, and there are few discreditable failures.

DRAWING FROM THE ANTIQUE.

Examiners: Seymour Lucas, R.A., and W. F. Yeames, R.A.

The examiners consider the work done at this examination very satisfactory, and that the steady improvement in past years has been well maintained.

The number of good drawings is considerable, and amongst these some are entitled to be called excellent. Almost throughout

the manner adopted in drawing the statue is good, and the work done with intelligence and with apparent purpose, all of which throws credit on the various schools to which the candidates belong.

The examiners are convinced that the marked intelligence imported into the work must be of great service to the students, whatever branch of art they may have to follow in after years.

DRAWING THE ANTIQUE FROM MEMORY.

Examiners: Seymour Lucas, R.A., and W. F. Yeames, R.A.

The examiners are pleased to find an advance on the work sent up last year, and that a considerable number of drawings have obtained high awards.

DRAWING FROM LIFE.

Examiners: Byam Shaw and H. S. Tuke, A.R.A.

Comparing the result of this examination with that of last year there is a considerable falling off in the quality of the work, which may be attributed in part to requirements under the new regulations in respect of memory drawing and the shorter time allowed at the examination for drawing from the life model.

There are a fair number of drawings which show intelligence and true feeling. Others, however, indicate merely a specious facility in execution.

ANATOMY.

Examiners: Professor A. Thomson, M.A., M.B., and Professor R. Howden, M.A., M.B.

There has been an increase in the number of papers received this year, and on the whole the standard of excellence is better than usual, though there are no papers of outstanding merit.

MEMORY DRAWING OF PLANT FORM.

Examiner: W. G. Paulson Townsend.

Generally speaking, this examination in its first year has been well understood. A certain small number of the papers show real excellence, and there is a large proportion of very good work. On the other hand, a number of the candidates have not been properly prepared for the examination, or have not shown that they fully comprehended the requirements or were able to cope with them.

PAINTING ORNAMENT.

Examiner: Lewis F. Day.

Considering the difficulty of the new subject—that is to say, of making a design as well as painting it within the time allotted—the results of this examination are most satisfactory.

Students appear to have taken to it with a zest which, though it may be due partly to the novelty of it, is no doubt to some extent accounted for by the greater freedom allowed than by the old monochrome-painting exercise; and quite a number of them have done better than might have been expected.

PAINTING FROM STILL LIFE.

Examiners: G. D. Leslie, R.A., and W. F. Yeames, R.A.

The paintings, though fewer in number than last year, show a standard of excellence of a very satisfactory character.

There are not, it is true, more paintings of the highest merit than there were last year, but the number of exercises of good sound work is distinctly higher. Throughout the students show more intelligence and perception of what is required in the way of tone, light and shade and refinement of colour.

PRINCIPLES OF ORNAMENT.

Examiners: G. C. Haité and F. Hamilton Jackson.

The average level of intelligence shown by candidates in answering the questions set is higher than that reached in last year's examination, though the examiners find that the larger part of those students who attempted the most advanced question were quite unfitted to cope with the subject.

The results of this examination go far towards showing that if students in the mass are not capable of producing work of the highest order—which is scarcely to be expected—they are, at least, in a fair way of being enabled to form a critical and logical judgment upon any objects submitted for their consideration.

HISTORIC ORNAMENT.

Examiners: J. H. Pollen and R. Phené Spiers.

The answers were in some instances intelligent, but taken as a whole, hardly up to the average of former examinations.

It is not possible to report favourably of the sketching. Quite apart from special preparation for an examination, the habit of sketching is necessary in order to store the memory with vivid impressions of the beauty of objects among the national treasures.

MODELLING FROM THE ANTIQUE.

Examiners: T. Brock, R.A., and W. Goscombe John, A.R.A.

The work done at this examination is fully up to the average, but as usual, many of the students have been allowed to sit without being sufficiently prepared.

MODELLING THE HEAD FROM THE LIFE.

Examiners: T. Brock, R.A., and W. Goscombe John, A.R.A.

The examiners are pleased to see that full advantage has been taken of this exercise, with the result that many excellent studies have been done.

The intention of this examination being to test advanced students in their knowledge of construction, it is to be regretted that so many have been allowed to sit without having had sufficient preliminary study.

MODELLING FROM LIFE.

Examiners: T. Brock, R.A., and W. Goscombe John, A.R.A.

The examiners are pleased with the work done at this examination, many of the exercises submitted being of considerable merit; attention, however, must still be drawn to the fact that a large proportion of the candidates presented for this examination had not been sufficiently prepared.

ARCHITECTURAL DESIGN.

Examiner: Professor T. Roger Smith.

The number of candidates was rather less than last year. The average quality of the work is, I believe, a little higher.

In considering the architectural designs of students it must not be forgotten that there is a strong desire for novelty in the art at the present day, and that something like a system of design based on forms not hitherto in use has been worked out for furniture and goldsmiths' work. Of those students who have failed in this examination many have keenly pursued novelty and novelty only, without the necessary knowledge of architectural forms or the skill requisite for employing them.

Many of the designs of those who have passed—and those among the freshest and most vigorous—have at least a strong flavouring of the "modern English" manner.

It is worth remark that, though there is one powerful design that is Tudor in character, there is no other to which the term Gothic can be applied; and it is also satisfactory that extremely few either of the weak, formal, hackneyed Renaissance designs, or of the designs based on the ordinary suburban villa, which in some years have been numerous, have been submitted this year. On the other hand, at least ten or twelve designs have been made, every one of which shows original power and a fair command of the features and details out of which a design is built up on paper.

DESIGN (ELEMENTARY STAGE).

Examiners: T. Erat Harrison and W. G. Paulson Townsend.

There is an increase in the number of exercises sent up this year, and on the whole, a marked improvement in the quality of the work, both in design and execution. This improvement, like that of last year, is due to an increase of fairly good exercises and a diminution of very bad ones. There has not been any appreciable increase among the very good.

DESIGN (ADVANCED STAGE).

Examiners: Walter Crane and Lewis F. Day.

On the whole, it is satisfactory to state that the general character of the designs submitted, the type of ornament and its treatment, are in advance of what they were. There is, on the one hand, less harping upon stereotyped forms of design, and on the other less indulgence in reckless extravagance of line or form without reference to constructive necessities. The tone of the work seems generally healthier.

DESIGN (HONOURS).

Examiners: John D. Batten and Walter Crane.

The examiners are glad to be able to note a very marked improvement in the character of the designs for a medal—the more so as last year they had occasion to deplore the inadequacy of the papers received in response to a similar exercise. On the whole, indeed, it may be said that the candidates showed considerable sense of the requirements of a medal, and a capacity for representing figures in relief.

MODELLING DESIGN (ADVANCED STAGE).

Examiners: D. McGill and Bertram MacKenna.

The average of merit is higher, particularly in the sense that there is a smaller proportion of very bad designs.

There are a good many designs which reach a high standard of merit, and a few which are really excellent. The number of exercises which exhibit a thoroughly good treatment of mouldings is very small, and another prevailing fault is a tendency of over-enrichment.

MODELLING DESIGN (HONOURS).

Examiners: T. G. Jackson, R.A., and W. Goscombe John, A.R.A.

The examiners consider that the quality of the work shown is inferior to that of last year.

Scarcely any of the designs show the slightest acquaintance with the principles of architectural design, and the examiners would repeat what they said last year, that students should not be allowed to enter for this examination till they

have had a sufficient training in architecture as well as modelling.

WORKS SUBMITTED FOR NATIONAL COMPETITION.

MODELLING FROM THE ANTIQUE, MODELLING ORNAMENT FROM CASTS, MODELLING FOLIAGE FROM NATURE.

Examiners: H. H. Armstead, R.A.; T. Brock, R.A.; G. Simonds.

Modelling the Figure in the Round from the Antique.—The examiners notice with regret a decided falling off, both the number and the quality of the works submitted this year for competition.

Modelling in Relief from Figures in the Round.—The examiners show little appreciation on that of last year. The examiners accordingly regret that they are again unable to make an award.

Modelling Heads and Busts from the Antique.—The examiners are glad to see that the improvement which was apparent last year has been maintained.

Modelling Ornament from Casts.—The works in general show little appreciation by the students of the refinement of the curves of the originals, and of the play of light and shadow on the ornament.

Modelling Foliage from Nature.—The quality of the works, though good, hardly reaches the standard of last year. With regard to the value of this study it is to be regretted that a small number of works is submitted.

MODELLING THE HUMAN FIGURE FROM NATURE.

Examiners: T. Brock, R.A.; W. R. Colton; W. Goscombe John, A.R.A.

Modelling Heads in the Round from Life.—The works on this subject show an improvement on that of last year, though there is a decrease in the number of examples.

Modelling the Human Figure in the Round from Life.—The quality of the work as a whole is similar to that of last year.

Modelling the Human Figure in Relief from Life.—The works submitted show some slight improvement, but it is to be regretted that there is not a better competition, as the study is a very important one, and its careful pursuit must prove the greatest benefit to the student.

MODELLING DESIGN.

Examiners: H. H. Armstead, R.A.; T. Brock, R.A.; T. G. Jackson, R.A.

Though the quality of the work submitted is not high, it reaches the standard of last year's competition.

In decorative work, sculpture and architecture are necessarily combined, and ought to be equally well executed. The examiners regret that in no case has the architectural part been successfully treated this year.

DRAWING FROM THE ANTIQUE, DRAPERY, &c.

Examiners: H. Draper; Seymour Lucas, R.A.; W. F. Yeames, R.A.

Drawings of Heads.—With one or two exceptions the quality of the work is much below the average.

Drawings of Hands and Feet.—The examiners regret that with one exception, the drawings submitted show no improvement upon last year's work.

Drawing the Full-length Figure.—Though not reaching the level of former years, the work includes some excellent drawings. A pleasing feature that the examiners notice this year is the method and delicacy of execution in a majority of the works.

Drapery upon the Antique Figure.—The examiners notice with regret that the quality of the work has fallen off. None of the studies reach the standard required for the award of a silver medal.

Anatomical Studies of the Human Figure.—The work is not quite equal in delicacy and excellence of drawing to that of last year.

DRAWING AND PAINTING FROM THE LIVING MODEL.

Examiners: E. J. Gregory, R.A.; H. S. Tuke, A.R.A.; W. F. Yeames, R.A.

Drawing Heads from Life.—The examiners are pleased with the work in this subject, and although there is room for improvement, which reaches the standard for a silver-medal award, the work generally is of a high average.

Details: Hands and Feet.—The examiners are pleased with the show of work in this subject.

Drawing Full-length Figures.—Although there is nothing worthy of a gold medal, the general level of the work is high, and the method of execution generally adopted is satisfactory to the exercise.

Time Studies.—The examiners are pleased with the display of works in this particularly useful study.

Drapery Studies.—The examiners are pleased with the efforts made by the students in this subject, but a

appointed with the results, considering the work that has been submitted in previous years.

Painting Heads from Life.—The examiners are disappointed with the work in this subject.

Painting the Figure from Life.—The work in this class is below what the examiners expected to see.

PAINTING FROM FLOWERS AND STILL LIFE.

Examiners: H. H. La Thangue, A.R.A.; G. D. Leslie, R.A.; W. F. Yeames, R.A.

The examiners would like to point out that although a still-life painting may be a beautiful work of art, the principal motive for the student in painting from still life should be to obtain experience of a technique which he has not hitherto mastered. Instead of this, in the majority of examples submitted to them the examiners regret to find the study of still life regarded too much as an end in itself, much time and labour being wasted in elaborating representations of groups of objects arranged with a view to pictorial effect. Works of this description are in the opinion of the examiners of little educational value.

Painting in Oil-Colours: Flowers and Still Life.—The examiners feel that the work does not reach the standard of former years. With but few exceptions a want of interest on the part of the students is still apparent, and the examiners repeat their remark of last year, that painting from still life, which should be a delightful study, seems to be regarded as a tiresome task. The result is that the work in general is more remarkable for patient labour than artistic spirit.

Painting in Water-Colours: Flowers and Still Life.—The average of the work in this class is below that of last year, and the examiners regret that a want of mental activity is shown in the majority of the works which leads to little but supplied industry.

Studies of Buildings.—The examiners are glad to see more studies of old buildings of interest in the vicinity of the schools from which they come, and that the quality of the work is better than usual. Two very creditable tone studies were sent from Wellington, New Zealand.

PAINTING FLOWERS WITHOUT BACKGROUNDS, STUDIES OF PLANTS IN PREPARATION FOR DESIGN.

Examiners: E. F. Brewtnall; Walter Crane; G. D. Leslie, R.A.

Painting Flowers without Backgrounds.—The standard in quality of the work in this class is well maintained.

Studies of Plants, &c., in Preparation for Design.—The examiners are pleased to see that some pains have been taken to meet the suggestions made in last year's report. As a whole the work shows careful observation and conscientious craftsmanship.

BOOK ILLUSTRATIONS, LETTERING, DESIGNS FOR COLOUR PRINTS, POSTERS AND BOOK COVERS.

Examiners: W. Crane; T. Erat Harrison; H. Holiday.

Book Illustrations.—The quality of the work as a whole hardly reaches the level of former years. The examiners are, however, pleased to observe that this year there is less extravagance and affectation.

Lettering.—The examiners are pleased to see that the subject of lettering has been seriously studied, both from the point of view of spacing as well as form of type. On the whole the work is very creditable.

Colour Prints.—More attention appears to have been paid this year to the adaptation of the drawings to the various processes of reproduction. The work in this class continues to maintain its standard, and the subject seems to attract a good deal of attention in the different schools.

Posters.—The show of works in this class is not remarkable either for quality or quantity, but this may be a sign that students have spent their time more profitably upon less general kinds of design.

Book Covers.—The designs in this class are not inferior to those of last year, but the designs for tooled covers again show a lack of taste. Their suitability for reproduction is in most cases proved by the executed covers accompanying them.

LACES, EMBROIDERY AND DAMASKS.

Examiners: A. F. Brophy; A. S. Cole, C.B.; W. Crane.

Designs for Wearing Laces and Lacelike Articles.—In this class the standard of work is well maintained. The designs show more variety than is usually the case, and are in general better adapted to the various processes employed. Devices based on natural forms are freely introduced into many of the designs and are treated as a rule successfully and consistently.

Designs for Embroidery.—The quality of the work this year is a higher level than before, taste and restraint being as noticeable. The designs showed that thought had been given both to the purpose for which they were intended and to the materials in which they were to be executed.

Designs for Damasks.—The examiners regret that the work does not reach the level of last year. A number of capable

designs are submitted in which the conditions of the material are fairly met.

STENCILS AND CARPETS.

Examiners: W. Crane; Lewis F. Day; J. H. Dearle.

Designs for Stencil Hangings.—The general standard of work is good, many competent designs being submitted in which less extravagance and more taste is noticeable than in former years.

Designs for Carpets.—The examiners are disappointed to find so few good specimens in this useful and interesting class of design. Some of the drawings are workmanlike but very commonplace.

PRINTED TEXTILES, WOVEN TEXTILES, LACE FOR HANGINGS, EMBROIDERY, MOSAICS.

Examiners: A. F. Brophy and Lewis F. Day.

Designs for Printed Mustins.—These designs maintain a high level. In general there is a precision about the drawings which the examiners are glad to see. The majority of the works submitted are distinguished by a prettiness and delicacy which is essential in designs for this material.

Designs for Printed Hangings.—The examiners regret that this very important branch of design has not had sufficient attention paid to it, and that the students have not taken advantage of the scope which cotton printing offers.

Designs for Woven Textiles.—The examiners regret that more attention is not given by the students to this important class of design. They note, however, with satisfaction that the designs by students who appear to be under technical instruction in weaving show a very fair level of taste, especially in the case of small patterns of two colours, in which due consideration seems to have been given to the effect of the reduction which ensues when the patterns are carried out in the material and there repeated, generally on a smaller scale than that of the drawings. On the other hand, the larger and more ambitious designs are not executed in an entirely workmanlike manner.

Designs for Lace Curtains.—The quality of the work in this class is exceedingly poor, and the examiners regret to see so little effort in this direction.

Designs for Embroidery for Curtains, &c.—The quality of the work in past years has been much superior to that now submitted.

Designs for Mosaics.—Though the number of designs submitted is small a high standard of excellence is reached.

INTERNAL DECORATIONS, FURNITURE, STAINED GLASS AND IRONWORK.

Examiners: T. G. Jackson, R.A.; Seymour Lucas, R.A.; Sir W. B. Richmond, K.C.B., R.A.

Designs for Internal Decorations and for Furniture.—The work in this class of study is very inferior to that of last year. It is to be regretted that the tendency towards eccentricity for eccentricity's sake is on the increase. The apparent aim of the majority of the students cannot be expressed better than in the words of one of the competitors—"The main aim in this design is individuality and quaintness."

Designs for Stained Glass.—There are not so many exhibits of a high class this year. The examiners regret that there should be a falling off in this important and educational branch of study, which ought to be encouraged.

Designs for Ironwork.—The examiners regret that the designs submitted in this important branch of fine-art industry do not reach a higher level. They observe that in the majority of cases the construction of the ironwork is not sufficiently understood.

METALWORK, ENAMELS, JEWELLERY.

Examiners: A. F. Brophy; W. Crane; Nelson Dawson.

Designs for Metalwork.—The level of the work is high and the examiners are of opinion that a greater knowledge of the practical requirements is shown this year; they still, however, observe here and there a tendency to repeat hackneyed forms.

Designs for Enamels.—The examiners are pleased to see that the designs as a whole show great progress in the appreciation of the technical difficulties in the art of enamelling.

Designs for Jewellery.—The designs for jewellery show rather more variety this year, though there is a tendency to follow the current fashionable forms instead of originating those forms which are more suitable for the purpose and the material employed.

POTTERY, TILES, PANELS AND FRIEZES.

Examiners: S. J. Cartledge; W. de Morgan; R. H. A. Willis.

Pottery.—The average quality of the work submitted in this class is very good, perhaps even equal to that of last year. Though the difficulties of the material have not yet in all cases been surmounted, there is a distinct advance in this respect.

Tiles.—Though the designs in this class hardly reach last year's standard, the examiners notice that, in general, attention has been paid to the necessities of the material.

Panels and Friezes.—Much excellent work is presented this year in which a good understanding of the processes of stencilling is shown.

HISTORIC ORNAMENT.

Examiners: T. Erat Harrison; Edward S. Prior;
Sir W. B. Richmond, K.C.B., R.A.

Historic Ornament—The examiners notice with regret that the requirements of studies of historic ornament are not yet completely understood, too many pictorial or still-life studies instead of working drawings being submitted.

MEASURED ARCHITECTURAL DRAWINGS, ARCHITECTURAL DESIGNS.

Examiners: J. Belcher, A.R.A.; Reginald Blomfield;
T. G. Jackson, R.A.

Architectural Drawings from Actual Measurements.—This year there are fewer exhibits in this class of study than usual, and the average quality of the work is poor.

Architectural Designs.—Few meritorious designs are submitted this year.

MR. WHISTLER'S WILL.

THE will of Mr. James Abbott McNeill Whistler, of 74 Cheyne Walk, Chelsea, and formerly of Fitzroy Street, Fitzroy Square, who died on July 17 last, aged sixty-eight or sixty-nine years, dated November 27, 1896, is as follows:—"I bequeath my wife's entire collection of garnets rare and beautiful, together with sprays, pendants, &c., of the same style of work or setting in white stones, brilliants or old paste, our entire collection of beautiful old silver and plate, and the complete collection of old china to the Louvre. This bequest is on condition that the three collections be gathered together in one and displayed as the 'Beatrix Whistler Collection.' Also that in it, or appropriately in the same room, shall be hung proofs of my wife's exquisite etchings, of which I leave a list attached to my will signed by me. And as to the rest and residue of my estate, of whatsoever kind, I devise and bequeath the same to my wife's sister and my ward Rosalind Birnie Philip; and I direct that she shall thereout aid my wife's son, Edward Godwin, in his training as sculptor by allowing him an income to the extent of one-fifth of the income of such residue when invested, such one-fifth to be paid to him until he attains the age of twenty-three years; and I appoint Rosalind Birnie Philip as sole executrix of my will. Signed." By a codicil made May 7, 1903, Mr. Whistler revoked the bequest to the Louvre, but he expressed a desire, without any wish to control or bind Miss Philip, that, in the event of her retaining the collection of garnets during her life, she would bequeath them to the Louvre upon like conditions with those contained in his will. The late Mr. Whistler's estate has been valued at 10,602*l.* 16*s.* gross, including 9,948*l.* 3*s.* 5*d.* in net personality.

Trades Unionism.

SIR,—This morning I had a call from a gentleman connected with one of the largest firms on the Continent, but who are eager to give a turn to British industry. He was explaining to me that in consequence of the difficulties of getting skilled labour in this country his firm had positively been compelled to send the raw material (British) to the Continent, have it worked there and return it to England. He has recently taken a contract for a job which made it requisite for him to employ twenty-two British workmen; his foreman came to him last week and told him sixteen must go, as they were spoiling the materials and also the other men on the job. These were all trades unionists and were paid 1*s.* per hour. The difference between the union man in this country and his fellow-unionist abroad was that supposing the latter was engaged on a piece of wood-carving, joinery or marblework, and fifteen or twenty minutes would finish the work, you could rely on his showing sufficient interest to forget the time. On the other hand, the British working man on the stroke of time would put down his tools and depart. My caller stated that he was most anxious to employ nothing but British labour. Am I to blame, Mr. Editor and my fellow architects, if I employ this foreign firm? Their productions are most beautiful, and their charges are in every way most reasonable. Apologising for taking up so much of your space, I am, &c.,

London: September 8, 1903.

PROFESSION.

GENERAL.

The King sent last Saturday 50*l.* to the Rev. H. Macdonald, vicar of Grayne, near Rochester, towards the restoration of Grayne Church. The German Emperor has also given aid and contributions have been received from the Prince of Wales and the Duke of Connaught. The vicar has raised 1,100*l.* but 700*l.* more is needed, exclusive of the porch.

The Prize offered by the Blackpool Corporation for the best pictorial poster design advertising the attractions of the watering place has been won by Messrs. Hubner & Wainwright of London. Drawings were sent in from America, Germany, France and other countries.

The Temporary Footbridges employed at London Bridge are to be sold. They are 1,000 feet long, were erected at a cost of 30,000*l.*, and consist of 800 tons of steel girders, 30,000 feet of galvanised corrugated iron, 30,000 cubic ft. of timber, 4,000 feet of steel rails, 4,000 feet of gutter-pipe and 225 squares of 3-inch flooring.

The Emperor of Germany has resolved to exercise his authority in sanitary affairs. Typhoid having broken out at Metz owing to the impurity of the water, His Majesty has issued a communication to Prince Hohenlohe, in which he says:—"There must be an end to this. In war time this state of things would inevitably result in a catastrophe. I must appeal to your Grace to proceed without the slightest delay, with the most effective means at your disposal, to put a stop to this and compel the town to do its duty."

The Following Clauses are proposed to be added to municipal contracts in Johannesburg:—"(1) To pay wages at rates not less than the current local standard rates and to observe the hours and other conditions of labour which are recognised as proper in the district; (2) to employ only skilled tradesmen in the performance of skilled tradesmen's work; and (3) not to sublet or assign the contract or any part thereof or any interest therein, except with the written consent of the town engineer and on such conditions as he may approve."

Mr. Herbert Ford, architect, died at his residence, Blackheath on September 1 after five days' illness at the age of seventy. He erected several large buildings in the district, including Messrs. Pawsons' in St. Paul's Churchyard.

Various Johannesburg Architects have been engaged in preparing designs for the new central railway station, including the headquarter offices of the Central South African Railways. One by Mr. T. A. Moodie, late of Glasgow, is accepted.

The Belfast City Council, in committee, have appointed Mr. Henry A. Cutler city engineer and surveyor of Belfast by a majority of twenty-seven votes to nineteen cast for Mr. J. J. Man. Mr. Cutler, who is a Scotchman, was formerly in the office of a Westminster engineer, and was entrusted with the designs and calculations of the structural ironwork of the Imperial Institute. There were between sixty and seventy candidates for the post.

Mr. George Spiers Kenneth, architect, died in Glasgow Infirmary on Sunday, from injuries received in the fall accident at St. Enoch Station in July last. This increases the number of deaths due to the accident to 16.

An Autumn Salon will be opened at the end of the month in the Petit Palais of Paris. Painting, sculpture, architecture, engraving will be represented, as well as objets d'art, &c.

The Late Henri-Charles Bunel was remarkable among the architects of Paris for the number of his official appointments. Especially was he connected as architect with the prefecture of police. He has been succeeded in that latter office by M. Jules Pray.

The Foundation-stone of the second lunatic asylum in the county of Worcestershire, which is to be erected on the Barnsley Hall estate, near Bromsgrove, was laid last week. The present asylum has accommodation for over 1,000 patients and has for a considerable time past been full. The new estate comprises 324 acres. The plans show accommodation for 570 patients, with administrative buildings, and provide for possible extension. The contract for the building amounts to over 150,000*l.*, and the total cost is estimated at nearly 200,000*l.*

Mr. James Higson, J.P., of Salford, has been nominated by the Council of the National Association of Master Painters and Decorators of England and Wales, Incorporated, for the position of President for 1903-4, and it is probable that the Convention next year will be held at Manchester.

The Thirteenth Centenary of the restoration of the ancient bishopric of London by the consecration of Merton Priory in 604 by St. Augustine will be celebrated early in January next.

Extensive Sanitary Improvements have been commenced at Naples. Parts of the slum property in the district known as the "Anticaglia," beneath which are the ruins of the ancient Greek city, are to be demolished.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

RIGHTON.—Nov. 9.—Designs are invited for a new school. Premiums of 50l, 30l. and 20l. will be paid to the second and third premiated designs respectively. Papers up to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. Secy, Brighton and Hove Hospital for Women, 76 West Street, Brighton.

DUBLIN.—Sept. 30.—Designs and specifications wanted for men's cottages, semi-detached or terraces, each cottage to exceed £100. The successful plan to become the property of the company on payment of £20. Mr. Francis B. O'Connell, Great Southern and Western Railway, Kingsbridge Road, Dublin.

WIMBORNE.—Oct. 7.—For sewage disposal of the village of Wimborne. Report, plan and estimate of probable cost. £100. 30 guineas. Further particulars, Mr. R. Loneragan, Wimborne Place, Folkestone.

WIMBORNE.—Sept. 14.—Competitive designs are invited for a new building to be erected in Church Street at a cost of £100. Premiums of 30l., 20l. and 10l. will be awarded for

designs adjudged of sufficient merit and placed first, second and third in order respectively. Mr. J. Ainsworth Settle, Municipal Buildings, Heywood, Lancs.

LEYLAND.—Sept. 26.—Plans are invited for the laying-out and development for municipal and other purposes of about 11,902 square yards of land in Church Road and Sandy Lane, Leyland, Lancs. A premium of 15l. 15s. is offered to the author of the plan considered to be the best design. Mr. M. H. Wilkinson, surveyor, 21 Towngate, Leyland.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75l. for design placed first, and one of 25l. for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100l., 50l. and 30l. respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 22.—Competitive plans are invited for the erection of a hospital and offices. Conditions of the competition and full particulars may be obtained from Mr. J. E. Shaw, clerk to the Lunacy Board, County Buildings, Ayr.

SCOTLAND.—Competitive plans invited for halls proposed to be erected at Overnewton by the St. Vincent (Sandyford) Masonic Lodge, Glasgow. Full particulars from Messrs. Walker, Fraser & Steele, 74 Bath Street, Glasgow.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100l., 50l. and 25l. will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20l., 10l. and 5l. will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

CONTRACTS OPEN.

WOOLWICH.—Sept. 24.—For the erection of public baths and washhouses on site adjoining 240 High Street, Plumstead. Mr. Frank Sumner, borough engineer, Maxey Road, Plumstead.

QUEEN VICTORIA MEMORIAL.

A BUSY scene is presented on the southern side of the Mall and the ornamental lake in St. James's Park. The contractors have been preparing the ground plan from the drawings of the surveyors of the Office of Works. The work is of an extensive character, including the construction of new roadways, the diversion of present thoroughfares, the damming of three-quarters of an acre of the lake, tree-cutting, and elevating the level of the lake bed to that of the Mall about 40 feet. About 300 workmen are engaged. The monument of Queen Victoria will be erected in the centre of the segment of a circle, now indicated by a wooden post distant about 60 yards from the central gateway of Buckingham Palace, and around it will be grouped imposing allegorical figures representing the extent and power of the Empire. Three new avenues will sweep from the Mall, at a point near Stafford House, by the memorial, one leading to Constitution Hill, a second into the grand thoroughfare in front of the Palace, and the third curving to the left and striking Birdcage Walk at right angles near the guard-room of Wellington Barracks. In place of the old pathway round the lake there will be a colonnade of Portland stone, with suitable sculptures, the first block having been already erected.

THE new school at King's Park, Dalkeith, which has been built by the Dalkeith Burgh School Board at a cost of 12,000*l.*, has been formally opened.

TENDERS.

BIRMINGHAM.

For the construction of five sewage silt tanks, four bacteria beds, each one acre in area, intake chamber, inlet and outlet channels, gauge basins, &c., with the laying and jointing of cast-iron supply pipes, varying in diameter from 54 inches to 6 inches, and other works in connection therewith. Mr. JOHN D. WATSON, engineer.

TRADE NOTES.

APROPOS of the recent race for the America cup, we note that the whole of the painting of the *Reliance* was done with Ripolin, supplied by Ripolin, Limited, Fenchurch Street, E.C. 1

THE isolation hospital, Ticehurst, Sussex, is being warmed and ventilated by means of Shorland's patent Manchester grates and exhaust roof ventilators, by Messrs. E. H. Shorland & Brother, of Manchester.

THE business of Jones's Foundry and Engineering Company, Limited, for so many years established at 156 to 158 Goswell Road, E.C., is still carried on at the same address under the proprietorship of Messrs. T. A. Richardson and W. W. Buckley in the name of Jones & Co., the original title of the firm.

BUILDING AND BUILDERS.

WYMONDHAM ABBEY is to be restored at a cost of 25,000Z.
A NEW pump-room is to be erected at Harrogate close to the old sulphur wells at the entrance to the Valley Gardens.
AN engineers' workshop, smithy, &c., are about to be built for Mr. W. Hurst in the New North Road, London. Mr. A. W. Hudson, of 87 Finsbury Pavement, is the architect.
THE parish church of St. Thomas, Portsmouth, which, owing to its condition, had some time since to be closed, has been minutely inspected by Mr. Jackson, the diocesan architect, upon whose recommendation an extensive scheme of renovation is to be carried out. The approximate cost is estimated at upwards of 4,000Z.

Main Entrance

213-204 TOTTENHAM COURT RD., LONDON, W.

Opposite Goodge Street.

MESSRS. CHAS. B. ROBERTS & CO., of Redhill, have secured the contract for fire-resisting works, alterations and additions at the Fountain Hospital, which are to be carried out at a cost of 12,950*l.* for the Metropolitan Asylums Board, under the supervision of the architects, Messrs. T. W. Aldwinckle & Sons.

At the last meeting of the School Board of the parish of Cathcart, Glasgow, it was reported that sites had been secured in Albert Road, Langside, and Cathkin Road, Langside, for the erection of two schools, each to accommodate 1,200 children, to meet the rapid growth of the population in that district. The price of the ground is 12*s.* per square yard.

RESTORATION has been commenced of the Norman towers of Lambeth Palace on the south-west and south-east. On careful examination it was found that the embattlements were very much fretted away and the large hexagon chimneys appeared to be in some danger of falling. The cause is attributed to chemical atmospheric action, there being numerous works in South Lambeth, the fumes from which are often wafted in a direct line to the old palace.

THE large extensions and alterations which have been proceeding at Gallatown public school (under the Dysart Burgh School Board) for the last twelve months have just been completed. Two large classrooms, a spacious corridor, with cloak-rooms, &c., have been added, and the older portion of the school buildings entirely remodelled. In lighting, ventilation and arrangement great improvements have also been effected and the whole premises brought up to modern requirements. The total cost will not be less than 2,500*l.* The school was formally opened on Monday last.

ANOTHER addition to the many social institutions which have been established in Port Sunlight, the model village on the banks of the Mersey, which has grown up in connection with the soap-making concern of Lever Brothers, Ltd., has been formally inaugurated. This latest acquisition takes the form of a free library and museum, which is the personal gift of Mr. W. H. Lever to the residents and employees who form the unique community of Port Sunlight. The library contains over 3,000 volumes, but this is regarded only as a nucleus, as Mr. Lever has placed an annual sum at the disposal of the managers of the library for extension purposes. The museum contains many interesting features, the whole collection being provided by Mr. Lever.

MR. WELLER, aged 63 years, foreman to a local builder near the Pantiles, went home from his work on Monday, complaining of feeling ill, lay down on the sofa and expired in a few minutes. Before he died Mr. Weller told his wife he had been stung the neck by a wasp, but whether that was the cause of death is not yet clear, although a medical man was promptly called in. It is thought that only a post-mortem examination will disclose the actual cause of the death, and determine whether an inquest will be held. The deceased was widely respected in building circles.

CONSIDERABLE progress is being made with the huge waterworks undertaking in the Peak of Derbyshire, in which the towns of Sheffield, Leicester, Nottingham and Derby are chiefly interested. The dams are to be of solid masonry from the foundations up, and the aggregate cost of the works, including filter beds, aqueducts and pipe lines, will be 7,000,000*l.* sterling. Of this total sum the Derwent Water Board will be responsible for 5,800,000*l.*, which covers the cost of building the five reservoirs in the Derwent and Ashop Valleys, making 14 acres of filter beds at Bamford, carrying an aqueduct 30 miles long to Ambergate, making a small service reservoir at this point, and laying a pipe line to Sawley, on the Trent. The cost will be shared by the authorities interested in the undertaking in proportion to the amount of water they take. Leicester is to have 35.72 per cent., Sheffield and Derby 25 per cent. each, and Nottingham 14.28, subject to certain claims from the counties of Derbyshire and Nottinghamshire. Sheffield will carry off its allowance by the aqueduct through the hills to the Rivelin reservoir, Leicester and Nottingham will carry their respective quota from Sawley, and Derby will help it by a pipe line from Ambergate. The cost of the subsidiary works is roughly estimated at about 1,100,000*l.*, thus bringing the total very near to 7,000,000*l.* sterling.

ELECTRIC NOTES.

JOHANNESBURG is going in for a very extensive electric-light and power plant, and it is to be hoped that the orders will come to this country. The total electrical output is to be close upon 7,000 kilowatts; but it has not been definitely decided by the consulting engineers in London, Messrs. Morley & D. whether steam or producer gas will be the motive power. Tenders are thus to be received for both systems. The plant will include water-tube boilers with mechanical stokers, &c.

eyers, &c, four 2,000 brake-horse-power steam engines or steam turbines, each driving 1,350 kilowatt generators, with four others of half this horse-power, one for operating a continuous dynamo, and the three others for two-phase alternators. There will also be two electrically-driven transformers and other similar gear. The units will be of the same size should gas motors be used, the internal combustion engines being simply substituted for the steam turbines or engines, and the gas-producing plant is to be equal to the gasifying of 7½ tons of Transvaal coal per hour, with all accessories of coal conveyers, &c. The contracts will be let before the end of the year.

THE electrifying of the tramways in South London is still diligently proceeding. In Southwark Bridge Road a number of men commenced on Monday to tear up the eastern side of the roadway, a temporary line having been previously laid down on the western side. The new portion of the line which is being laid down in the Marshalsea Road, to connect the lines between the Borough High Street and Southwark Bridge Road, is also being proceeded with rapidly, while in that portion of Southwark Bridge Road which runs right up to the bridge itself the metals have been laid down and the necessary connection lines made for the trams to resume the return journeys. When the lines running round the Marshalsea Road and down Southwark Bridge Road nearly to the Elephant and Castle have been completed, one of the most important developments of the new electric system of trams in South London will be ready for use, and new services will be commenced which will run from Streatham and Brixton, New Cross and Camberwell, and probably Balham and Clapham, direct to the foot of Southwark Bridge. The new line along St. George's Road, between the Elephant and Castle and the Westminster Bridge Road, is also being rapidly laid down, and when completed will enable the trams from New Cross and Camberwell to proceed in this wide thoroughfare, and so ease the congestion along the London Road and at the Obelisk.

AN important decision has been made by the Underground Electric Railways Company, of London, in awarding the contract for the entire control equipment for their new electric trains on the Metropolitan District Railway to the British Thomson-Houston Company, of Rugby. The system to be employed is the Sprague Thomson-Houston multiple unit system, with which an experimental train has been equipped in their newly-opened line from Ealing to Harrow, and on which, for over four months past, continuous experiments and

competitive tests under special and normal conditions of traffic have been going on, to ascertain which of the two systems of control competing will best meet the various requirements of this railway, having a due regard to the safety of passengers, reliability of control, economy of power, low cost of maintenance, comfort to passengers and simplicity. After thoroughly weighing all of these matters the contract was, as above-mentioned, awarded to the British Thomson-Houston Company. It may be remembered that a somewhat similar series of tests were made before the decision was arrived at as to what system of control should be adopted on the New York underground railways, and the same system of multiple unit train control was decided upon. This system may be considered as the universal system in use for operating electric railways, it being in use or contracted for by over thirty-two railways throughout the entire world. Over 2,000 equipments are at present in use. The Metropolitan District Railway, in taking this step have placed themselves in line with other English electric railways, which have also adopted the system. This method of control is used by the Central London Railway (Twopenny Tube), the Great Northern and City Railway (Underground Tube from Finsbury Park to Moorgate Street), and is to be employed on the lines of the North-Eastern Railway, near Newcastle, for which contracts for electrification have recently been let. The firm's systems are also most successfully used in the United States of America, notably on the overhead railways in the cities of New York, Boston, and Chicago, and on many high speed inter-urban roads, where they are giving unqualified satisfaction.

VARIETIES.

THE Hackney Guardians are about to erect children's homes at Chipping Ongar. Mr. Finch, architect, of 76 Finsbury Pavement, has been instructed to prepare the plans.

CONSIDERABLE alterations and additions to the premises of Messrs. W. Cooper Brothers in the High Street, Harrow, are contemplated. Messrs. Cowell & Shaw, of Finsbury Pavement, are the architects.

THE Corporation of the City of London require a junior measuring clerk starting at 150/-, and rising 10/- yearly to 200/-. Applications must be made to Public Health Department before the 22nd inst.

INSPECTION INVITED.

Full particulars on application to the Manager, E. VINCENT EVANS, 63 and 64 CHANCERY LANE, W.O.

DUKE STREET Congregational Union church, Leith, which for the past two months has been undergoing alterations, has been reopened. The interior has been completely modernised. Electric lighting has been installed throughout the building, and the arrangements for ventilation and heating have been brought thoroughly up to date. The interior has also been painted, the roof being ivory white and the walls light terra-cotta. The alterations have been carried out at a cost of 500l.

ON Tuesday, the 1st inst., a large company gathered at Godre Aman, a rapidly-growing suburb of Aberdare, to celebrate the opening of the new school, which provides accommodation for 250 scholars, having five commodious classrooms and a central hall. It was built from plans prepared by Mr. T. Roderick, Aberdare, and the contract was carried out by Mr. J. Jones, Gwawr Cottage, Aberdare, at a cost of 2,600l.

AFTER being closed for several months, St. Paul's Wesleyan church, Runcorn, was reopened on Sunday afternoon. The building has undergone extensive alterations. The old roof and ceiling, which were slowly giving way and becoming dangerous, have been completely renewed, and new ones with modern improvements substituted. The whole building has been painted and decorated, and the organ overhauled and repaired. The total cost of the work is about 2,000l.

THE parish church at Cleator was reopened on Sunday, the 6th inst., after having undergone extensive alterations which have quite transformed the appearance of the interior of the edifice. In the nave the roof has been renewed with oak, and fresh seats and new windows provided, but the chancel has been allowed to remain in its ancient form as a reminder that from 700 to 800 years have passed since the church was built. The families of the Ainsworths and the Lindows have done much to make the church attractive by the insertion of two stained-glass windows; and a beautiful lectern in oak, designed by the architect of the work, has been provided by Mrs. David Ainsworth. Among other matters the heating of the church has received careful attention, and two bells have been hung for use in announcing the services. The whole of the work has been carried out under the superintendence of the architect, Mr. Martindale, of Carlisle.

COUNCILLOR JAMES HIGSON, J.P., of Salford, has been nominated by the council of the National Association of Master House Painters and Decorators of England and Wales, Incorporated, for the position of president for 1903-04, and it is probable that the Convention next year will be held at Manchester. It will be then exactly ten years since the Association

visited the city, the last occasion being at the time of its inauguration in 1894. It will come to Manchester next year a strong and representative body, as its constituents cover the whole of England and Wales. Amongst its five life members are Mr. Walter Crane and Mr. George Haire, two are American citizens and one an eminent Scotch decorator. The tenth annual Convention meets at Nottingham on the 21st inst., and Lord Henry Bentinck, M.P., is to open the proceedings.

THE chancel of Bangor Cathedral has been reopened after complete renovation at the expense of Lord Penrhyn. For many years the chancel presented an appearance discreditable to the cathedral, damp having ruined the fresco-work, and was mainly through the efforts of the late Dean Pryce that the improvement and other much-needed structural repairs to the edifice were carried out. A pathetic interest attached to the opening ceremony in the fact that the arrangements governing were drawn up by Dean Pryce only a few hours before his death which came with remarkable suddenness. On the east wall the *Te Deum* is represented with the figure of Our Lord in Majesty occupying the central position above the large stained-glass window, and on each side are depicted angels swinging censers. On the decani side of the east window are large paintings of St. Edward, St. Stephen, St. Thomas of Canterbury, St. Edward the Confessor, St. Amphibalus, St. Lawrence and St. Alban, and along the south wall are the twelve apostles and the figures of four angels holding scrolls bearing the word "Alleluia."

AUCTIONEERS' INSTITUTE.

THE members and friends of the Auctioneers' Institute of the United Kingdom met at Exeter on Wednesday evening from various parts of the country for the autumn provincial meeting at the invitation of the Western Counties' branch. The visitors found that excellent arrangements had been made by the local committee for their comfort and for seeing the ancient city and some of the beauties of Devon. The objects of the Institute include the provision of a central organisation for auctioneers, estate agents and valuers, and such things as may be necessary to elevate the status and procure the advancement of the interests of the profession. A valuable reference and lending library has been established for the use of members at the headquarters in London, and a benevolent fund is also in existence. The Institute does not possess a charter, but one will doubtless be obtained at no very distant date. — Mea

the area identified with the Institute is rapidly increasing and there are ten branches, covering Birmingham district, Hants, Wilts and Dorset, Kent, Surrey and Essex, Liverpool and district and North Wales, Manchester district, the Midland counties, Northumberland and Durham, South Wales and Monmouthshire, the Western counties of Yorkshire. The membership already totals 1,500, and the financial condition of the Institute is very satisfactory. About 100 members and friends are taking part in the present meeting. Last night there was a reception by the Mayor and Mayoress of Exeter in the historic Guildhall. To-day there is an excursion to Totnes, Dartmouth (by the Dart), and to-day, where the Mayor and Mayoress of that borough will receive the party. To-morrow there will be a meeting of the Council, a luncheon and a banquet, and visits will be paid to various places of interest, including the cathedral. Among those taking part in the visit are the President, and Mrs. J. J. Green (London), Messrs. J. J. Greaves and J. Baker (Birmingham), W. Weatherhead (Keighley), E. Dobson (Bradford), J. Richards, K.C., M.P. (London), J. R. Garland, J. C. (London), J. R. Hedley and C. Horsley (Newcastle-on-Tyne), H. J. (Carlisle), J. J. Robinson (West Hartlepool) and W. H. (St. Helens).

NEW CATALOGUES.

General Iron Foundry Company, Ltd., Brook's Road, Upper Thames Street, have now ready their new illustrated catalogue of nearly 600 pages, and it will be found extremely handy and useful volume, containing as it does thousands of illustrations of ranges, stoves and fittings, radiators, baths, lavatories, closets, sanitary brackets, and connection gutters, ornamental columns, lamp-posts, grilles and grates, verandahs, balconies, bandstands, roofs, coverings, stables, cowhouses, piggeries, farm-fittings, carriages and other gates, and every other imaginable work in cast and wrought-iron.

We have received a copy of a new illustrated priced catalogue of the various lifts and hoists manufactured by Messrs. Hope Works, Kirkstall Road, Leeds. These include electric and belt-driven cage lifts, safety gates for cage and dinner lifts, electric and belt-driven friction hoists, and accessories for hoists, hand hoists (endless rope), hand cranes (handles), jibs or catheads, and swing cranes

for power and hand hoists, derrick cranes (hand), overhead travelling cranes, &c.

SANITATION AND FARMING.

A PAPER was read at the Sanitary Congress, Stranraer, by Mr. Richard Henderson on "The Sanitary Necessities of a Modern Farm." He spoke of the advantages to be derived from the professional sanitarian and the agriculturist pulling together. The sanitary necessities of a modern farm might be narrowed down to abundance of good water and fresh air without stint. Simple in attainment as these objects seemed, it was with regard to them that all trouble between the parties arose. The water-supply question was more acute on the small than the large farm. The public health officer had more trouble over the matter of providing fresh air for the animals at the farm than in seeing to the water supply. To one unacquainted with the principles of rural economy it must, indeed, sound strange to be told that fresh air was one of the sanitary necessities of a modern farm. So it was out in the field. But neither man nor the domestic animals could thrive under constant exposure to weather in all its phases, and each had to provide for or be provided with shade when the sun's influence was more powerful than the animal frame could withstand, and with shelter when it was too much on the wane to temper weather to a degree which was acceptable. Hitherto the sanitary officer had had to confine his fatherly interest in the affairs of the homestead proper to the housing of the cow and the arranging of the dairy. That interest might with advantage be extended to the houses of the other classes of live stock at the homestead. The farmer, in his endeavour to keep the cows warm, checked or prevented ventilation of their quarters if he thought them too roomy. He was not adverse to ventilation where the air space of the cow-house was not, in his opinion, unduly large. Had the time not now arrived for the public health officer to be allowed full discretion as regarded the sizes of byres, so that each building of the kind might be in accordance with the nature of its surroundings. The size of the house might be left pretty much in the hands of the proprietors, were the public health officer allowed the full say over the matter of ventilation. A cow-house might be simply yet sanitariously finished at very little more outlay than the common type.

Mr. Peter Fyfe opened the discussion, dealing mainly with the importance of a pure water supply. He had read the

reports of the medical officers of health for different places, and had come to the conclusion that a great many of our farms and dwelling-places had not what Mr. Henderson called good water to drink. He did not know what Mr. Henderson meant by good water—water which was above suspicion. He deprecated proprietors putting difficulties in the way of securing satisfactory supplies; and said every medical officer, and if possible every sanitary inspector, should endeavour to obtain samples of every well which appertained to farms. He moved "That in the opinion of this Congress the importance of a water supply demands that legislation dealing with the conservation of the sources and with the conditions attached to the acquisition of water is urgently required, and that it be remitted to the Parliamentary Bills Committee to bring this matter before Parliament at an early date; and, further, that all local authorities should have power conferred on them to refuse to register a dairy keeper until they were satisfied that the premises were in a sanitary condition, and that the water supply was sufficient and free from contamination."

Mr. John McCaig said that perhaps too much had been made in regard to the cubic space necessary for the cow. No doubt a certain cubic space was required, but sanitary and local authorities, he thought, had erred in fixing a too rigid limit for counties or even divisions of counties. He emphasised the necessity for more light in byres, and remarked that he would have all the light from the roof, and such a sufficiency of it as would make the animals believe they were in the open.

Mr. Robert Lindsay, county sanitary inspector, Midlothian, agreed with Mr. McCaig as to the necessity of light, but could not agree with him as to his strictures on the cubic space restrictions. He was puzzled to know how comfortable accommodation was to be provided if they did not provide the air space necessary for ventilation. He thought the Local Government Board were moving on sensible and right lines in the recommendations they had framed as to air spaces. He seconded Mr. Fyfe's resolution and the discussion of the subject was adjourned.

The foundation-stones of a new church and schools in Station Road, Old Hill, Birmingham, in connection with the Strict Baptist denomination have been laid. The buildings which it was now proposed to erect would be capable of accommodating about 500 worshippers, the total cost being 1,400.

A PALATIAL HOTEL.

MANCHESTER has not hitherto been regarded as a well-to-do city in the matter of hotel accommodation, although it boasted one or two comfortable old hostels where the wants of man and beast were sufficiently looked after, there was nothing to compare with the luxurious caravanseraies which during the past few years have sprung up in all towns and cities of any pretensions to importance. Recognising no doubt the eligible opening thus afforded by the Midland Railway Company, with characteristic thoroughness stepped into the breach and erected a palace of which Manchester alone, but the kingdom at large may well be proud, and Cottonopolis is in possession of hotel accommodation which cannot be excelled, even if it be equalled, by any in the United Kingdom or the European Continent.

In their efforts to attain this result Mr. W. Towle, the company's hotels manager, and Mr. Charles Trubshaw, their architect, were indefatigable, travelling in all directions and inspecting every hotel of importance in Europe and America, with a view to obtaining and assimilating the latest ideas and improvements. The site of this important addition to the amenities of Manchester occupies 2 acres of land, bounded respectively by Peter Street, where is the main front, Mosley Street, Deansgate, Windmill Street and the Central Station yard, which it is connected by a light-bulb glass-roofed way.

Rising from the pavement for 26 feet the front elevations are built of red Aberdeen granite with strap granite dressings and thence to the roof of terra-cotta blocks. Steel, as in the American "sky-scrapers," forms the backbone of the building and in the winter garden the supports and girders have been artistically employed in acting as a basis for the decoration. The hotel contains about 600 rooms, and some 55,000 cubic feet of terra-cotta is represented on the building. Some idea of the rapidity with which the work was carried through may be gained when it is stated that 8,000 yards of this last-mentioned work were completed in a month, and the fireproof ceilings and roofs were fixed at the rate of 1,000 yards a day. With a view to rendering the immense building thoroughly fireproof it was decided to adopt for all internal walls a system supplied by the Fireproof Plate Wall Co., Ltd., whose head offices are in Manchester, and of these plate walls are both fireproof and soundproof, no less than 30,000 square feet were used. The baths number nearly 100, including a Turkish bath, and are most luxuriously and expensively fitted up.

have been supplied by the Standard Sanitary Company of
Lombard Viaduct. There are over 800 windows. The style of
the building is Renaissance, freely adapted by the architect.
Burmantofts faience of a rich brown colour is extensively used
in the ornamentation of the exterior. The highly glazed sur-
face of this material possesses the very great advantage that
it practically affords no lodgment to dirt and soot, what-
ever dust may accumulate on it is readily washed away by
every passing shower, and the surface consequently retains its
bright and attractive appearance. The plain portions of the
walls are in Burmantofts glazed terra-cotta, which is also, of
course, impermeable to dirt and chemical deterioration. The
city walls of the inner building, rising on four sides high
above the glass roof of the garden, are consequently treated
with glazed white bricks, so as to afford ample light everywhere
in the interior of the hotel.

At the top of the building is another garden, which is
claimed to be the biggest roof-garden in the world. It
includes places it above the smoke-line of the city, and secures a
fine view of the surrounding country. Elevators communicate
this aerial resort for after-dinner coffee and cigarettes.
Musical entertainments are to be a feature of the roof-garden.
The air of Manchester leaves much to desire on the score
of purity, and to secure as pure air as possible in the hotel
Mr Towle has adopted an excellent system of purifying the
incoming air. A series of filter screens of linen and coke,
which receive 80,000 cubic feet of air per minute, effectively
removes all impurities, and the visitor in the hotel lives in an
absolutely pure atmosphere. Revolving doors at the various
entrances also completely prevent the entry of either dust or

It is interesting to note the way in which the architect
has contrived to obviate the disadvantage (if it be one) of having
a back door, so to speak, to his hotel. He had to exercise
skill and ingenuity to find one which would prevent all
unpleasant influences from being perceived or suffered by
the guests. He utilises, for example, the "newel" of the circular
stairways as a concealed dust-shoot to each floor. Dust,
ashes and dry refuse of every kind are every morning collected
by the servants, and shot down through a concealed trap to the
basement, where it is received by the incinerator and duly
disposed of. In all sorts of ways labour-saving appliances have
been brought into service, even to the extent of sweeping the
floors of the rooms; and in respect of the sanitary equipment
of the hotel, from ground floor to upper, it is as perfect as

thought, labour and money can make it. Indeed, in point of
lightness, space, ventilation and cleanliness, this most impor-
tant department of any hotel may be considered a model.

The grand entrance in Peter Street at once impresses the
visitor. Here are the necessary offices of the management
and reception hall. The arrangements are such as will
contribute largely to the convenience of visitors and hotel
officials alike. Nothing apparently that the wit of man can
devise to obviate all needless trouble in running about seems
to have been forgotten in the general arrangements of this
department, which comprise postal, telegraph and telephone
facilities, a banking bureau, and all sorts of other conveniences
of latest date, which the travelling public often nowadays looks
for, or at least hopes for and rarely gets. Not far away will be
found that indispensable adjunct to a cosmopolitan hotel—the
American bar.

The grand entrance gives admittance at once to the garden,
practically the central point of the hotel, of which it forms a
delightful feature, and thence to the grand staircase through
the octagon court, which abuts on the garden. A beautiful
display of light-toned variegated Grecian marbles of the
quarries of Skiros, richly gilded ornamentation of pillars and
supports and delicate intermingling veins of light brown and
grey please the eye and gratify the taste in colour.

One of the most important features is the concert hall, con-
structed to accommodate an audience of 1,000. This apartment
is decorated in white and gold, in Louis XIV. style, with panels
containing painted subjects. Concerts for ladies, organised by
the management, will also be given.

The grand dining-room is a noble apartment, Georgian in
style, with a slight infusion of Louis XIV. in the ornament.
In shape it is an elongated octagon, the middle part of which
is divided from the bays for constructive purposes by means of
two imposing square pillars beautifully cased in panelled
mahogany handsomely gilt. The ceilings are richly orna-
mented with modelled plaster in deep relief, the middle part
being decorated with a bold oval design with concealed electric
lights. The walls up to the cornice are covered with finely
panelled mahogany, exquisitely decorated with gilt ornaments,
but both the mahogany and the gilding are toned down to pro-
duce the effects of the decoration of the period. The mahogany,
instead of being polished and in its natural colour, is stained
slightly darker and finished with a rather dull surface to imitate
the work of the old French panellists, and in a similar way
the gilding has been toned to produce an exact reproduction

Excelsior and Rawdon Potteries,

of seventeenth-century ormolu. The room contains a very fine chimneypiece surmounted by a panelled picture of Prince Charlie in oils, there being on either side a large panel of tapestry. The chairs are of the shape of the period, and the four serving tables and the service screen are all beautifully decorated *en suite* with the general scheme of the room. An agreeable relief in colour is afforded by the employment of a pile carpet in two tones of green which entirely covers the large area of the room, and by the use of green leather for the upholstery of the hundred odd dining chairs for the use of the guests.

Another room which calls for attention is the restaurant, in the Louis XIV. style. It is oval in shape, the walls being panelled with oak and tapestry, with painted medallions over the tapestry panels. The novelty of treatment will be agreeable not only to the Manchester residents, but particularly to the many Continental visitors whom the commerce of the city attracts. Also on the ground floor is a smoking-room, charmingly decorated and panelled with oak in the Elizabethan style, freely modernised.

There is on the first floor what is termed the "Royal Suite," consisting of a Georgian dining-room, a Louis XVI. drawing-room, an Empire writing-room, a Georgian sitting-room and a ballroom. In the dining-room, decorated in a delicate scheme in white and gold, the introduction of small painted panels has a pretty effect. The fireplace, surmounted with a triple mirror; the windows with their upper panels leaded with heraldic devices; the Chippendale furniture in mahogany, upholstered in green; and the green Saxony carpet, produce in combination a decorative ensemble of the most effective kind. In the sitting-room the walls are covered with crimson silk divided into panels with silver braid, the furniture is Chippendale, with crimson coverings, and the carpet is of old-rose colour. This constitutes a colour scheme full of a quiet, refined warmth. In this and in most of the private sitting-rooms the furniture has a distinctly English character, and has been reproduced from the best eighteenth-century models. The French drawing-room is a white-and-yellow treatment, the white woodwork with ormolu ornaments being filled with panels of striped yellow silk. In the writing-room silk panels bordered with cut velvet are used for the walls, the cornice and the dado being in white, enriched with gold ornaments. The furniture is of mahogany, with ormolu mounts, and the chimneypiece is also decorated with ormolu mounts.

The bedrooms throughout are similarly tasteful and luxurious. Electric light is, of course, the only illumination employed, 6,000 incandescent and 26 arc lamps being used, and giving an aggregate of 85,000 candle-power. A telephone is installed in each room within easy reach of the bed. Every bedroom has its own synchronised clock-dial, which can be electrically lighted from the bed by its occupant, as also can the lights (three) in the room.

The decorations and furniture were provided by Messrs. Waring & Gillow, who have finished the various rooms completely in the different decorative styles, Jacobean, Georgian, and Adams, as well as the different French periods, and a noticeable sense of completeness prevails throughout. The mosaicwork has been very artistically executed by Messrs. Diespeker, Ltd., of Holborn Viaduct, who have put in upwards of 1,000 yards of Roman cube marble mosaic and a similar quantity of Venetian marble mosaic. The lifts throughout are Easton's express electric passenger lifts, supplied by Messrs. Easton & Co., Broadway Chambers, Westminster, S.W., who are installed in various parts of the building.

DISEASES OF STEEL.

At the concluding meeting of the Iron and Steel Institute, Mr. C. H. Ridsdale (Middlesbrough) presented a paper on "Diseases of Steel." Referring primarily to soft steel, he said that with all our progress in the study of steel there is still no definite and approved system of tests published for recognising its "diseases" and determining their origin, by the results of which those concerned might abide. Analysis failed to explain most of the troubles met with. He had attempted to combat various types of faults; he had pushed his investigation on both ends forward by synthetical reproduction of known irregularities of manufacture and backward from manifestations of the disease till its unknown cause was detected. He marked that the one great hindrance to progress in tracing faults to their origin was the strong hold various notions, which, though perfectly right in a general sense, when carried to an extreme were misleading. One such notion was the extent to which impurities, particularly sulphur and phosphorus, were hurtful. Nothing was further from his wish than to advocate indiscriminate laxity in the matter of impurities.

wanted was not to advocate stretching the limits in order to admit inferior material, but only to face fairly whether or not by raising the limits in many instances material answering the requirements as well, or sometimes better, would be obtained more cheaply or readily. Another mistaken notion was that the maker ought to enter his material proof against being spoiled in successive working-up processes. The fact was that no make of steel had been met with that could not be spoiled quite simply. The iron then considered at length the various diseases to which it was subject. It would be far too bold a claim, he said, to pretend for one moment that as soon as the disease had been successfully traced and identified a commercially applicable remedy could be at once suggested. To avoid brittleness and hardness, and to obtain toughness and softness with a minimum of trouble, he advocated reheating rapidly after the steel became cold and deprecated continuing to heat steel which was already hot. Respecting the cure of faults already produced in material, this from the nature of the product was scarcely possible, as for instance, where through red-irritness or hardness cracks or fracture respectively had usually occurred. In other cases where possible cure was not practicable, the cost being prohibitive, still there were some cases where a very simple heat treatment or similar remedy would be quite effective and at a very slight cost.

Mr. J. E. Stead said that it would have been better if Mr. Ridsdale had termed his paper the "ailments of steel." He did think that steel had many diseases. They were chiefly ailments which might easily be cured. The diseases Mr. Ridsdale referred to could be mostly removed by a very simple reheating treatment. He would refer to only one point. When engineers made specifications it should in justice to them be said they did so with the object of getting material of the very best character. It was quite possible for steel containing high impurities properly treated to be better than the purest material improperly treated; but it must be remembered that for engineering work the lower the phosphorus the better, and if such steel were also properly reheated and forged it would be always better than a material which contained a higher amount of impurity.

Professor Turner (Birmingham) said the Institute was very much indebted to Mr. Ridsdale for his attempt to put on a scientific basis a method of investigating defects of steel and iron. He was very glad to see that Mr. Ridsdale advocated the synthetic method of discovering the causes of the defect.

He himself had tried to discover the cause of blisters on wrought-iron in this way. He had introduced into a specimen those constituents which were supposed to be the cause of blisters, but the blisters did not follow. The explanation, he thought, was that one needed not only to have the materials necessary to produce the fault, but the proper conditions also.

The president (Mr. Andrew Carnegie) asked permission timidously to make a suggestion. Their distinguished fellow-member, Mr. Stead, had spoken of the "ailments" of steel instead of the "diseases." He would suggest that even Mr. Stead had not got the right word; it should be the "mysteries" of steel. He remembered that one of his managers—a German without scientific experience, but a practical man, who came to Pittsburg at six dollars a week and died a millionaire—they were great men these Germans—once said that he never allowed a test of iron to be made until it had lain for a week to cool. He found that its tensile strength was increased by so doing, the molecules having time to adjust themselves. All his life he (Mr. Carnegie) had seen more and more of the mysteries of steel. Steel had a soul in it. He was forced many, many times to recall the words of Professor Tyndall that we were yet to find all forces in matter when he saw sand into which a magnet was put cohering to the magnet when placed in another direction, and separating when the magnet was turned in the opposite direction, showing that every grain of sand had a positive and negative life. He could never pass a bar of steel without being reverent, because in that bar there were perhaps all the mysteries of human life. We were on the threshold of great discoveries. He wished that he could be made immortal along with Mr. Ridsdale and Mr. Stead, the one the apostle of the diseases of steel, the other of its ailments, and himself of its mysteries.

THE HOUSING PROBLEM IN JOHANNESBURG.

In South Africa, as in various parts of Great Britain, the question of accommodation for the less wealthy members of the community requires an urgent answer. In Johannesburg a Housing Commission is holding an inquiry. Some of the statements presented will suggest the difficulty.

Mr. Evans, the secretary of a building society, wrote:—There is undoubtedly a considerable scarcity of houses at from 4% to 5% rent per month, and I think such scarcity will become more acute, owing to the extension of shops, which, in many

cases, renders necessary pulling down houses of the class workmen live in. Owing to the prohibitive price of land within a radius of three miles, landlords are compelled to erect houses, which will give a reasonable return on the capital sunk in the ground, and that necessitates the erection of houses which will let from 10% and upwards. On account of this factor, very few, if any, strictly working-men's cottages are now being erected.

I think it very hard that a working-man, earning, say, 25% per month, should have to pay, say, 10% a month for a house. I heard of an instance the other day in which a foreman carpenter, earning 25% per day, was paying 15% per month for a semi-detached house of four rooms and a kitchen, on a 50 by 50 feet stand, and I know of other cases in which the parents and half a dozen children are herded together in houses of three rooms and a kitchen, the rooms being about 10 by 10 feet in size. The working-man has no choice; he must live near his work and he has to pay whatever rent is asked. (In the term "working-man" I include clerks and salesmen, who are perhaps married on a salary of 25% per month or less.)

I think the cause of the scarcity is largely due to the expansion in the building trade. Workmen from other towns, and even from Australia, have flocked to Johannesburg to secure the high wages. When a lull occurs, these workmen will take their departure; there are not any large factories in Johannesburg employing numerous hands; the mines house their own employes, and it seems to me that this must be the chief cause.

Personally, I think the factors are in favour of a great increase in the population of Johannesburg in the course of a few years.

If cheap land were available, I believe private enterprise would remedy the existing congestion; but what do we see? Land situated east, west and north is held at high speculative prices, and in many instances the owners of private townships look askance at the erection of houses at a cost of less than 1,000% sterling. The working-man's cottage is tabooed anywhere within a reasonable distance of Johannesburg; owners of townships desire to have high-class houses on their estates.

Improved means of locomotion would be a great assistance, if it took place to where land was cheap, and subject to no restrictions, but it will not serve the purpose aimed at, to open up townships where land is already held at prohibitive prices, and no tramway or railway should be built to serve one purpose only. To succeed they must carry many interests.

Seeing that land is not available east, west or north of the town, the only avenue is south, along the line of the new Vereeniging railway. I think, if Government would lay out township on generous lines on one of the farms it is about expropriate, at a distance of from fifteen to twenty miles away from Johannesburg, and sell the land to heads of families (Europeans) in acre plots at cost price, not exceeding 10% per acre, and run convenient workmen's trains at low fares, would induce a great many respectable workmen to make the homes there. The plot-holders could combine and form building society amongst themselves, by means of which they could build their own homes.

Mr. Otto Schuller, a property owner, gave in the following statement:—

As a resident here since 1888, and as a property owner Johannesburg; I think my opinions may be of interest to the Commission. My experience is that houses having three, four or five rooms, kitchen, pantry and bathroom, are in great demand anywhere within easy distance of the business part of the town. I consider that the rents paid for houses of this kind are quite out of proportion to the accommodation and conveniences offered. It is, however, to the enhanced value of property in Johannesburg that the cause of high rentals must be laid, and not to the extraordinary greed of landlords, as has so often been stated. In many instances in the early days small houses were built upon stands which have tremendously increased in value. These stands have changed ownership from time to time, always at enhanced values, and as consequence the inadequate accommodation erected thereon has to be charged for at a most disproportionate price in order to pay even a very low percentage upon the capital invested. time, no doubt, many of these places will be pulled down and replaced by business premises, warehouses, &c., and, as a natural consequence, the population will have to seek dwelling further removed from the centre. Almost continuous surrounding Johannesburg innumerable townships have been laid out. Some have been sold as freehold lots, others again as leasehold. In my opinion, the making of these townships accessible will immediately relieve the present congested state of the town itself. On the north and east of the town townships have been laid out as far as eight miles away, on the west up to six miles, and on the south to four or five miles. Some of these places are almost inaccessible on account of the bad state of the roads leading thereto. In fact, residence most of them is almost impossible from this cause alone.

here is, however, another great deterrent to residence in suburbs I have mentioned, and that is the almost total absence of any water supply and the lack of sanitary arrangements. In some of the townships, no doubt, water can be obtained by means of wells, or by damming up small water-courses and springs which exist thereon, but in others there is utterly no water obtainable by any other means than the laying of pipes and pumping water from considerable distances, by a regular waterworks system. In some places recourse has been had to the collection of rain water in tanks, but the use of such a supply must always be considered precarious, in an exceptionally dry season places the unfortunate residents in a most unenviable position. It is to the opening up of townships alone that we must look for relief from the present excessive rents demanded in the town; and townships can only be opened up, firstly, by the building of roads in different directions, or laying a light circular railway with branch lines; secondly, by securing an efficient water supply and sanitary service; and thirdly, by the making of good main roads from the town to the outlying districts. It does not hold with the view that it is the duty of the Government to lay out portions, or to acquire land from the present holders and sell to intending purchasers. There are thousands of cheap unsold stands in the near vicinity of Johannesburg, where there is plenty of room in the townships were they made accessible by road and rail, and habitable, by having a water supply and sanitary service. Stands within a few miles of Johannesburg can be purchased for as little as 4c. and 5c., so that in these instances the amount of interest required on the purchase price of the land is a very small factor.

Mr. Ewart S. Grogan read the following statement:—
I believe that the root causes of the present appalling conditions in the town are identical with the causes which have induced the hopeless collapse of the Government's attempt to introduce settlers on the land.

The main cause is the facility with which a "corner" can be induced and maintained because of—(1) The concentration of large sums of money (subscribed by the public) in the hands of operators who are interested in maintaining an artificial shortage of land; (2) the inducements to subscription afforded by the speculative attractions of the financial rights vested in land ownership; (3) the insignificant financial strain necessary to maintain such a "corner," due to the practical immunity of the land from taxation or compulsory beneficial occupation. Thus millions of acres can be

held back at no greater cost than the sum total of company administration; (4) the corner is completed by the tenacity of the land-owning Boer, who is in most cases simply a squatter and not a holder of land on a commercial basis.

Thus the supply is beautifully regulated, and every jump in price due to a sudden wave of demand can be indefinitely maintained. In fact, the demand is being scientifically fed.

The chief contributory cause is the temporary and unexpected "corner" in developments on land. That is to say, there has been a sudden and excessive demand for stands and farms with buildings, while at the same time the congestion of the railways, the perpetuation of the same by the notable incapacity of the railway administration, the shortage of spot building material and of labour to handle same, the tightness of money and the general feeling among those willing to embark capital in building enterprise that the inflation, which has evolved from such a combination of causes, cannot be maintained, have prevented an increase of supply sufficient to overtake the demand for habitation.

In the case of urban property there can be little doubt but that the immediate cause of the enormous increase in post-war rents has been brought about by a grave shortage in buildings, and that in the first stage this rent represented the monopoly price of bricks and mortar. But later, owing to the completeness with which the activity of Johannesburg has been ring-fenced by enormously powerful corporations, it was found easy to snatch a large proportion of this monopoly price of bricks and mortar and tack it on to land. Thus although we find that the interest on capital invested on building land is gradually resuming what we may consider under existing conditions to be the normal figure, yet rents still remain practically constant and the difference is being netted by land. This process must continue until the large holders have to a much greater extent unloaded on the public.

Now it follows that, if my diagnosis is in the main correct, any extension of tramways or facilities of approach to outside areas, which by the way are just as effectually cornered by strong holders, can only result in an increase in land prices. With an increase in land prices the temptation to build will disappear and the present conditions will tend to perpetuation. As an example, the mere suggestion that an observatory and a road would be constructed for the beautification of Bellevue East has materially enhanced the price of the stands in that township. In the course of time, as the holding of land is more generally distributed over the community, there will be

a tendency for prices to become normal, that is, resultant upon the free play of supply and demand.

No immediate relief can be obtained except by taxation of urban areas, such taxation to be assessed on the unimproved value and made payable by the ground landlord. This would have the effect of forcing the landlord to himself build or throw his land on the market, to be taken up by someone who was prepared to build. It would to a great extent destroy the speculative element in prices, and in time "burst the corner." There can be no doubt but that the retrograde action of the Government in ignoring the Town Council's desire to rate on unimproved values only has been a considerable factor in maintaining the present cruel pressure on the active element on the land. It should also be made illegal for landlords to fix their prospective liabilities on tenants, and any measure tending to obviate this evasion should be made retrospective.

If anyone doubts the effectiveness of the "corner," I would refer him to the terms offered by the Kensington estate, which are to the effect that the purchaser may buy land, may then lease it, such lease to carry the right of purchase; but that the land shall still remain in fact (except as regards payment of rates or taxes on the land) the property of the landlord, who shall have perpetual servitudes over, and to whom it shall eventually revert without further process. I believe that even this is considerate compared with some of the extant forms of tenure.

THE SOUTHWARK BRIDGE IMPROVEMENT.

THE Bridge House Estates committee of the City Corporation have issued a report on the following reference:—"That, having regard to the prospective increase in the income arising from the Bridge House Estates, it be referred to the Bridge House Estates committee to consider and report to the Court generally upon the existing facilities for traffic across the river Thames within the City's jurisdiction, and to make such arrangements for increasing such facilities both as regards bridge accommodation and otherwise as they may deem expedient in the interests of pedestrian and vehicular traffic, and more particularly as to the desirability of improving the northern approach to Southwark Bridge by the construction of a viaduct starting from a point in Queen Street adjacent to Cannon Street, over Upper Thames Street to the commencement of the bridge. And, further, to consider as to the practi-

cability of removing the cast-iron semicircular arches of bridge and replacing them by low-crowned elliptic arches adopted at Westminster Bridge." The committee report to the City surveyor (Mr. A. Murray) and Mr. E. W. Cruttwell, the then assistant consulting engineer to the Town Bridge, were instructed to consider the best means of effecting improvements to Southwark Bridge and its approaches. They accordingly reported, and suggested the following methods of improving the bridge:—(1) By lowering the present bridge and its approaches and raising the levels of Upper Thames Street; and (2) by lowering the present bridge and constructing a viaduct across Upper Thames Street." It was considered by the committee that the cost of carrying out the latter plan, together with the necessary spur streets, would be far too heavy to justify its being recommended to the Common Council for adoption. The first-named design contemplates the lowering of the summit of the bridge between 7 feet and 8 feet, the improvement in the gradient of Queen Street, the raising of the level of Upper Thames Street between 3 feet and 3 feet 6 inches (where the approach to the bridge intersects), and the streets and lanes leading therefrom proportionately. The special sub-committee recommended that that scheme should be adopted and carried out at an estimated cost of 350,000/. Vehicular traffic returns have been taken over the four City bridges, and have proved that owing to the gradients, Southwark Bridge is not much used by heavy vehicular traffic. The new scheme entails a reconstruction of the bridge, the only portion of the present structure to be utilised being the shore abutments. The width between the parapets is at present 42 feet 6 inches, and is proposed to increase it to 60 feet 6 inches. The scheme will result in an improvement in the gradient of the north side from about 1 in 23 to about 1 in 50, and on the south side from about 1 in 23 to about 1 in 40.5, comparing very favourably with the gradient of Blackfriars bridge, which is 1 in 40. The actual amount that the bridge may be lowered will depend largely on the views of the Thames Conservancy Board, whose consideration will, no doubt, be influenced by the fact that a headway at Cannon Street railway bridge at high water is 25 feet 4 inches, while at Southwark bridge it is 28 feet 9 inches. The committee state that the improvement now suggested, if carried out, will no doubt result in the bridge being used to a much greater extent by the heavy wharf and warehouse traffic which will not cross while the present gradients remain. The Common Council will be asked to consent to the proposal.

ARMOURED FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London."

Officially Endorsed by the
Fire Offices Committee.
Lighter and Cheaper than
Iron Doors.

Can be made to Close

And at Glasgow, Leeds, Birmingham, &c.

The Architect.

THE WEEK.

ALTHOUGH the evidence given before the War Commission has importance for every inhabitant of Great Britain, it was not until Major HILLS, who has charge of mapping in the Intelligence Department, described his experience that civilian readers who follow technical pursuits could be expected to realise the extent of the mismanagement for which the War Office is responsible. Every surveyor knows the value of correct maps, and can realise that success or failure in war may sometimes depend upon them. One of the causes of the failure of the French in the Franco-German war was their defective maps. There was perhaps some excuse for the inadequacy of the maps representing the seat of war in South Africa, although it would have been easy to have had useful plans prepared. But with the exception of the gold-yielding area of the Gold Coast Colony no attempt has yet been made, says Major HILLS, to survey upon sound, well-considered methods any portion of any of the British possessions in Africa. The maps are crude, and based on all sorts of heterogeneous material. In other parts of the world there is the same indifference to surveying, arising, no doubt, from the belief that war is never likely to take place in those regions. France spends nearly 60,000*l.* a year on military surveys. The outlay in Germany is unknown, but they possess the most accurate maps existing not only of their own possessions but of those of other countries. Italy spends about 20,000*l.* In England the annual expenditure on military surveying is 6,500*l.* The Ordnance Survey in England has cost so much money, and the operations have been spread over so many years, there is some reason for supposing that a military survey of the colonies would become an intolerable burden on taxpayers. But a different class of work would serve. It is considered that all the plans which are absolutely necessary could be carried out by a staff of seventy officers and 340 assistants, including all expenses, for 170,000*l.* a year. Compared with the outlay in other branches of the service, that sum seems only a trifle.

In the majority of cities fashion has of late years preferred the western side. Berlin is no exception. The favour in which the western suburbs of Charlottenburg, Schöneberg, Wilmersdorf are held is suggested by the number of applications made for permission to build. In April last there were 542 applications, 628 in May, 647 in June, while in July they totalled 679. This shows a steady progress. Out of the 679 as many as 588 permissions have been granted, and the others are still under consideration. It is on the western side that the forests of Spandauer, Arnswald and Tegeler still exist, and building sites in the vicinity are necessarily most picturesque. There is also a long line of lakes. The places are easily approached by railways and tramways. There are moreover several of those beer-gardens, some having excellent theatres, which are always attractions to Germans.

If the Italians are eager to see a successor to the Campanile erected in Venice they would do well to call in a foreign architect and allow him to consummate the work without local interference. So great a sacrifice might be more than the Italian nature could bear, but there is so much jealousy existing it is doubtful whether a Venetian can satisfy the rest of Italy, or an architect from any other of the Italian cities can satisfy the Venetians. This peculiar condition of affairs is made evident by the publication of Signor LUCA BELTRAMI's pamphlet, which he calls "Seventy-two Days' Work on St. Mark's Campanile." It will be remembered that he resigned his appointment as architect for the reconstruction. His motives were dismissed, and the general opinion was that Signor BELTRAMI had come to a conclusion about the impossibility of carrying out the work in a satisfactory manner, and it was better to escape the responsibility than to be for ever associated with a failure. He does not now express any opinion about the practicability or the reverse of the plans which

were prepared. But he appears to imply that he would not have the support from the Venetians which was desirable with so important a work. It is also apparent that he was not confident about the use of materials from the old campanile. The tests to which samples were subjected in Milan he considers were insufficient. In such cases as Signor BELTRAMI's it is generally advisable to read between the lines of an explanation, and there is little doubt he has had to endure enough heart-burning during ten weeks to compel him to leave the unsatisfactory duties of his office to be accomplished by men of a different class.

THE statue of RENAN which was unveiled a few days ago at Tréguier, his native place, is likely to give an erroneous idea hereafter of his intellectual gifts. The academician is represented as seated; he was too ungraceful to form a standing figure, and beside him is posed the goddess PALLAS-ATHÈNÉ. That suggests a man who was devoted to Greek literature, philosophy or art. It is true that in his old days, when RENAN visited the Acropolis of Athens, he knelt in worship of the spirit of the place, which was personified to him by the guardian deity of the city. But his tendency throughout life was Semitic rather than Hellenic. When he was twenty-four he won the Volney prize of the Institute for his "General History of Semitic Languages." At a later time he sought the chair of Hebrew and Chaldaic languages in the College of France, and although unsuccessful he obtained a consolation prize in the appointment to Phœnicia, where he was to seek after inscriptions. Subsequently he obtained the coveted chair, and after a single lecture was deprived of it. The majority of his books relate to the subject of religion, and especially the relations between the Hebrew religion and Christianity. It would be only by subtle reasoning that his numerous volumes could be supposed to be inspired by the Athenian goddess.

It may not be generally known that a collection of photographs of places having geological interest in the United Kingdom are being obtained, and it already numbers 3,771 views. Large as is this total, the following twenty-five counties are still entirely unrepresented:—Cambridge, Huntingdon, Rutland, Carmarthen, Clackmannan, Dumbarton, Dumfries, Kincardine, Kinross, Roxburgh, Selkirk, Carlow, Kildare, Kilkenny, King's Co., Leitrim, Longford, Monaghan, Queen's Co., Roscommon, Tyrone, Waterford, Westmeath, Wexford and Wicklow. The work is unofficial, but the collection is stored at the Museum of Practical Geology in Jermyn Street. The funds obtained are small, for in thirteen years 130*l.* was received and 101*l.* 10*s.* expended. The British Association has therefore acquired a valuable and unique collection at the cost of rather less than 6½*d.* per print. There is a duplicate collection of 450 views, which is lent to local societies on application. The secretary of the committee is Professor W. W. WATTS, of the Birmingham University.

ONE of the consequences of the marital difficulties between OBERON and TITANIA was, in SHAKESPEARE'S words, that "the nine men's morris is fill'd up with mud, and the quaint mazes in the wanton green for lack of tread are undistinguishable." The game referred to was known in France as "merelles," or "marell," and according to STRUTT was sometimes played at a table with black spots at the angles and intersection of the lines, and sometimes with holes in the ground. A curious discovery by Dr. SCHNEIDER, an archæologist of Mayence, has revealed that the game was also in use in Germany during the twelfth century. He has come across in a high gallery of the cathedral of Worms two representations of it. Evidently the parties engaged were the workmen employed on the building, and who at their dinner hour or other interval amused themselves with the game. The arrangement corresponds with the practice still followed in some parts of Germany. The cathedral is an old building, and is supposed to have been completed either in the eleventh or beginning of the twelfth century. Dr. SCHNEIDER considers that the eastern part where the gallery is found dates from 1121, and that other parts were not finished until 1234. Whichever date is accepted it becomes a proof of the antiquity of "nine holes" as a recreation for masons and workmen.

COAST PROTECTION.

A REPORT was presented to the British Association at the Southport meeting which does not appear to have received much attention. Because it bears no renowned names it is likely to be overlooked by the public in general. Yet the subject is of unquestioned importance, for it relates to changes in the sea-coast of the United Kingdom. Five years ago it was resolved to request the Admiralty to arrange for the co-operation of the coastguards in securing systematic observations on the erosion of the land by the sea. Every one acquainted with the history of the British Association is aware that at some of the early meetings papers were read by members of that force. The "handy-man" occasionally finds time to think and reflect. The ocean has interest for him in more ways than for landmen, since experience has given him those mental faculties which add strength to sight. It is not difficult to turn him into a skilful observer. To enable him to follow a systematic course in this case, instructions were prepared by a committee of the Association, as well as forms on which the observations were to be recorded. For the last four years they have been collected and filed. So much material was accumulated it was decided to tabulate and collate the data. The duty was undertaken by Mr. JOHN PARKINSON, M.A., of St. John's College, Cambridge.

A geologist knows that the sea continues to be the most important agent in the transformation of the surface of the globe. To his mind's eye Great Britain and Ireland were once united and constituted a part of the continent which we now call Europe. He observes, too, that the destructive force seems to be mainly directed at the level of the habitable land; for at great depths it is doubtful whether the operations of the mass of waters are equally effective. No doubt in some cases the waves appear to defeat themselves, for through their agency beaches are formed which become ramparts. The Chesil Bank between Portland and the mainland is an instance of this compensatory reaction. The destruction of a particle of matter is believed to be an impossibility, and it may therefore be assumed that what the sea demolishes in one place is used in building up islands and continents somewhere else. As is usual in all natural operations the debit and credit sides of the account are found to be evenly balanced.

We poor mortals are incapable of deriving consolation in broad views of physical forces whenever our own petty but selfish interests are imperilled. While we are endeavouring to hold our own against our fellow mortals in other parts of the globe, our little island is being wasted by those waves we are accustomed to look upon as our best protection. In different places we hear of buildings and even villages which have vanished. The Londoner who cannot allow himself more than a half-day excursion ticket is able to visit spots where the land has had to succumb to the sea. In the tenth century at Walton-on-the-Naze, or Walton-le-Soken, a church with houses existed, which, owing to the fear of pirates, were erected at some distance from the coast. No traces of them are now visible. Better known is Reculvers, which is not far from Herne Bay, on the Kentish coast. DOUGLAS JERROLD, who loved the little town, said that in his day "at lowest tides the people still discover odd, quaint household relics, which, despite the homely breeding of the finders, must carry away their thoughts into the mist of time, and make them feel antiquity. The very children of the village are hucksters of the spoils of dead centuries." He acknowledged that it was difficult to conceive the annihilation of a whole town engulfed in the ocean, and fancy suggested that only a "sea change" was suffered, and that the old inhabitants are carrying on their everyday business somewhere else. In the time of HENRY VIII. the parish church of Reculvers was nearly a mile from the sea. Indeed, Kent affords many remarkable proofs of the coming and going of the sea in respect to the land-line, as well as of what can be done to prevent destruction. To anyone who has an interest in reclamation, Romney Marsh is one of the most interesting parts of England.

People who live inland imagine that the wear and tear of the waves along the coast is so gradual it can scarcely be expressed in feet and inches. Sir CHARLES LYELL was told by a Hampshire farmer that along that part of the coast

the average loss was taken to be a yard in width per year. In parts of Devonshire the average was believed to be 10 yards a year. Some of the beautiful bays which are now enjoyed by visitors on the west coast are to geologists visible evidence of erosive power. Fortunately, however, the sea recognises the advantages of a give-and-take policy. Southport, where the British Association meetings were held, is an example of recession, for a sea bath is not only to be obtained at some distance from the shore. On the whole it is considered by those who have investigated the subject that the area of England and Wales at the present day is not less than the area of the country five centuries back.

It must be admitted the destruction now causes greater inconvenience than was possible in the fifteenth century. Those who had to traverse the sea in ships were obliged to live on the shore. But where the trade was not great people wisely resided at some distance from it. In modern times when those who have been pent in cities look on a sojourn at the seaside as indispensable, houses have been erected for their gratification as close to the sea as sites can be found. The possibility of destruction becomes then a more serious affair than it is for the farmer whose fields stretch to the shore. The losses which can arise are now exhibited in some of the seaside resorts on the east coast. The work of destruction is frequently facilitated also by the withdrawal of shingle, gravel and sand, and it cannot be denied the materials are used mainly for building. The information sought through the agency of the coastguards partly related to those abstractions of protective elements, and it is not difficult to realise the advantages which would often be gained if more control were exercised over what SHAKESPEARE calls the unnumbered pebbles of the beach.

The reports received from Scotland mainly deal with the eastern coast. It is stated that a road which was dangerous near Stranraer is now protected by concrete walls. At Helmsdale in Sutherland there has been a loss of land, but it is partially stayed by a breastwork of wooden piles. At Gourdon the coast suffered through the removal of shingle and the absence of groynes. There seems to be no regular custom with regard to shingle. In some places it is not allowed to be carried away, in others permission is given. Near St. Andrews landslips have occurred and material is removed by building contractors.

The changes in the English coast from St. Abb's Head to Saltburn are said to be insignificant. In a part north of Blyth sand is carried off, but for some miles south of Blyth it is not removed. Between Filey Point and Flamborough Head the coast is reported to be stationary, but in Filey Bay and the neighbourhood the loss is about 3 feet per annum. There was formerly an annual loss of about 6 feet north and south of Bridlington Harbour, but through the agency of piling and groynes the scour is prevented. Along the reach of coast forming a continuous line between Bridlington and Spurn Head the coast is receding where not specially protected at the rate of 6 feet per annum. At Withernsea the loss is 9 feet. In addition there are occasional falls of cliff which are locally attributed to the scarcity of sand at the base. At the estuary of the Humber chalk-stone groynes have prevented erosion. At Cleethorpes 20 feet of bank have been washed away since 1899. Along the Lincolnshire coast as far as Saltburn the losses are insignificant. In parts of the Wash the sea is receding, and efforts are made to reclaim the land for cultivation. On the East Anglian coast, between Saltburn and Harwich, there is continuous erosion. It may be taken as from 6 feet to 9 feet per annum. The lighthouse on Lowestoft Ness has had to be moved back 249 feet "as a consequence of a loss to the headland on which it stood of 120 feet in the year." The annual loss at Happisburgh is estimated at 9 feet. From Covehithe to Dunwich, a distance of 6½ miles, the yearly loss is 10 or 12 feet. Dunwich is a historic sufferer, for once it possessed a dozen churches, which the sea claimed as victims. At Felixstowe 2½ miles the coast gained by being groined. Along the Essex coast there is little change, owing, it is believed, to the protections, which are mainly groynes. The lengthening of the pier at Walton-on-the-Naze has added to the land.

The northern part of Kent would appear to be most liable to erosion. The eastern and southern shore seem

gain from the shingle. Near Hampton the yearly loss is from 15 to 20 yards. Between Birchington and Reculvers it is about 6 feet. St. Margaret's Bay, near Dover, about which so much was anticipated, has suffered greatly since 1900. At Dover the sea has encroached about 40 feet in twenty years. Coming to Sussex, it is found that the groynes at Brighton retard the shingle from working east; but the cliff from the Aquarium eastwards crumbles away with high winds and spring tides. At Felpham, near Bognor, the groynes have become useless through neglect, and a loss of 40 feet is reported in two years. On one side of Chichester harbour there are no groynes, and the land consequently suffers. There are fourteen records of encroachment from the Isle of Wight. In those parts where coast defences have been set up they have, at least, saved the land from the waves. In Dorset the encroachment varies from 2 to 3 feet, but in several places there are falls of the cliff. Only a few reports have been received from Devonshire, and they do not mention any important changes. Cornwall also has only slightly suffered. A slight encroachment occurred at Newlyn which caused the road along the seafront to be abandoned. The cliffs are continually falling in the neighbourhood of Clovelly and Hartland Point, where there are no groynes. Out of twenty-four reports received from South Wales, eight record loss of land.

It is needless to say that some kinds of rock are more liable to destruction than others. Not only is there little resistance in several of the formations, but in rocks where there are fissures the compressed air also operates and there is a front and rear attack. Sometimes it happens that the shingle acts like bullets, but in certain conditions of tide the whole of the force is expended on the pebbles and the shore line is preserved. The construction of groynes can be regarded as no more than a temporary expedient, for it is absolutely necessary by restorations to keep all the timbers, whether piles or sheetings, in sound condition. The report presented to the British Association has yet to be considered by experts, but the lesson inculcated by the returns is that no time should be lost in setting up groynes in all places where they are likely to be useful. It must be admitted that the work is often found to be disheartening. There may be a succession of severe seasons, and in each of them the groynes may suffer. It is some satisfaction that they are not an expensive class of construction, and if they are successful they may repay the outlay a thousandfold.

GIOVANNI BAPTISTA PIRANESI.

AMONG the men who have devoted their lives to the glorifying of architecture there is not one who has more claim to remembrance than PIRANESI. He produced about two thousand etchings, some of them being 10 feet in length, and the majority were intended for the exaltation of Roman buildings. It cannot be said that of late years his plates have received the attention they deserve. This arises from a supposition of their inaccuracy. Artists are allowed to depict the creations of nature, such as mountains, rivers, trees, clouds, men, animals, in an imaginative way. The aggrandisement of subjects is supposed to denote a vigorous mind. But in architecture, which can be considered an imaginative art, the exercise of imagination in representation is not tolerated. To PIRANESI's eyes everything architectural appeared magnificent, and his plates are judged as if they were no more than working drawings. The manner in which kindred spirits can consider them is suggested by a passage in DE QUINCEY's "Opium Eater," relating to his own architectural dreams:—

Many years ago when I was looking over Piranesi's *Antiquities of Rome*, Mr. Coleridge, who was standing by, ascribed to me a set of plates by that artist called his "Dreams," and which record the scenery of his own visions during the delirium of a fever. Some of them (I describe only from memory of Mr. Coleridge's account) represented vast Gothic halls, on the floor of which stood all sorts of engines and machinery, wheels, cables, pulleys, levers, catapults, &c., expressive of enormous power put forth and resistance overcome. Creeping along the sides of the walls you perceived a staircase, and upon it, groping his way upwards, was Piranesi himself. Follow the stairs a little further and you

perceive it came to a sudden abrupt termination, without any balustrade, and allowing no step onwards to him who had reached the extremity, except into the depths below. Whatever is to become of poor Piranesi, you suppose, at least, that his labours must in some way terminate here. But raise your eyes and behold a second flight of stairs still higher, on which again Piranesi is perceived, by this time standing on the very brink of the abyss. Again elevate your eye, and a still more aerial flight of stairs is beheld, and again is poor Piranesi busy on his aspiring labours, and so on until the unfinished stairs and Piranesi both are lost in the upper gloom of the hall. With the same power of endless growth and self-reproduction did my architecture proceed in dreams. In the early stage of my malady the splendours of my dreams were, indeed, chiefly architectural, and I beheld such pomp of cities and palaces as was never yet beheld by the waking eye, unless in the clouds.

There was a time when in many old-fashioned houses in this country half a dozen or more of PIRANESI's plates, which bore some relationship among them, used to be hung on the walls of rooms. In WALTER SCOTT's diary after his financial crash there is a pathetic entry concerning one of those sets. He wrote:—"Promised SHARPE the set of PIRANESI's views in the dining parlour. They belonged to my uncle, so I do not like to sell them." Few engravings were better adapted for the mural decoration of an apartment. The vigorous lines, the strong contrast between light and shade, and the subjects which could be comprehended at a glance, made them seem more fitted for a wall than for a portfolio. But fashion changes, and photographs are now considered a better decoration.

The date of PIRANESI's birth is uncertain. In French books of reference it is put down as 1708; in English as 1720. He was a Venetian. As his father worked as a mason it is not improbable he belonged to a family who followed that trade, and the love of architecture in the young JOHN BAPTIST was hereditary. His father was desirous to make an architect of him, and in order to give him the fullest scope he sent him to Rome with an allowance of 6 piastres, or about 30s., monthly. Architectural studies in those days were based on a different system to that now adopted. PIRANESI may have been following the usual routine when he devoted himself to the representation of Classic buildings, and for an artist of his ability it was almost as easy to etch as draw in pencil or colour. In any case, the father thought three years was a sufficient stay, especially as he was likely to anticipate there could be co-operation between himself and his son. Rome had, however, thrown her glamour over the young artist, and he declined to return to Venice. His allowance, small as it was, was withdrawn. JOHN BAPTIST may have anticipated that he could gain independence by his etchings.

In 1741 he brought out his first collection of some two hundred plates relating to the antiquities of Rome. The pencil, as DRYDEN says, speaks the tongue of every land, and strangers in Rome were glad to obtain copies. The earlier engravings of buildings were either timid or coarse. It was at once realised that PIRANESI was an interpreter and was able to impart some of his own characteristics to his subjects. The exaggerations were believed to resemble those of SALVATOR ROSA, and much would be pardoned for the sake of the power to be seen on every plate.

In spite of his success PIRANESI for a time suffered poverty. He was married and his plates were produced in the midst of the noise inevitable with young children in a small house. Sometimes, however, he insisted on seclusion, and, indeed, there was as much need for it in his case as there would be for any painter or sculptor engaged on original creations. Young architects who take part in architectural excursions are not likely to approve of PIRANESI's methods. As an enthusiast every ancient example in Rome was likely to make a deep impression upon him. He appears in many instances to have depended mainly upon the strength of his recollections. He rarely made any preliminary drawings or sketches on paper. He usually attacked the plate directly. Sometimes, after etching the outline, he would endeavour to show the effect of masses by working on the plate during moonlight in front of the building. It would be an error to compare his etchings with those of REMBRANDT, which represent a different class of subject and were treated on a different principle. But PIRANESI's plates can assert themselves beside the Dutch master's, for they have a solidity

which is remarkable. Most of the subjects are derived, not always with exactitude, from ancient examples, with the exception of "Carceri d'Invenzione," the plates with which COLERIDGE was fascinated. The majority of those dealing with antiquities before his time were generally no more than outlines. The massiveness and darkness of those by PIRANESI were considered an innovation and gave rise to much discussion. That by some authorities his work was regarded with favour is evident from his being elected a member of the British Society of Antiquaries. If imagination had been carried to excess by him he would not be admitted by so learned a body.

English artists were also willing to utilise his services. For ROBERT MYLNE he produced a view of Blackfriars Bridge, showing the work in process of construction and before the centreing had been removed from the arches. He also executed a plate or two for ROBERT ADAM, the architect. Lord CHARLEMONT, an Irish peer, wished to display himself as the patron of the artist, and to have the "Architectura Romana" dedicated to him. But in some way PIRANESI believed himself to be slighted, and for his lordship's name others were substituted. The nobleman, however, appealed to the courts of law in Rome, and judgment was given in his favour. In those days controversies with all their consequences could hardly be avoided. PIRANESI published letters in which he maintained with some vehemence that the Romans did not derive all their arts from the Greeks. The buildings demonstrate the influence of Etruscan monuments which were of a nobler style than those of the Greeks. He had other controversies with respect to the dates of some of his temples, a perilous question for a passionate man. His knowledge of architecture was considered to qualify him for the superintendence of several works in churches. The exuberance to be seen in his etchings was displayed in some of them, for they are overloaded with ornament. One remarkable example is the church of S. Maria Aventina, which he restored in 1765. A man who subjected himself to severe restraint could not, apart from architectural work, produce twenty-nine folio volumes, some having immense folding plates. The titles of the most important among them are as follows:—"Architectura Romana," 208 plates, 4 vols., atlas folio; "Fasti Consulares Triumphalesque Romanorum;" "Antichita d'Albano," 35 plates; "Campus Martius," &c., 54 plates; "Magnificenza dei Romani," 44 plates; "Vedute di Roma," 2 vols., 130 plates of modern buildings at Rome; "Collection of Candelabra, Vases," &c.; "Collection of Chimney-pieces;" "Carceri d'Invenzione," 16 plates; "A Collection of Antient Statues and Busts," 350 subjects; "The Trajan and Antonine Columns;" "Antiquities of Herculaneum and Pompeii." He was assisted, no doubt, by some pupils as well as by his five children, but the lion's share was performed by himself. This will be sufficiently evident from a comparison with the plates by his son published in Paris, many of them being coloured. Although excellent and more in keeping with modern taste, they do not display the tremendous force seen in JOHN BAPTIST's plates. He died in 1778. It was recognised at the time that none of his predecessors had represented architecture, whether in ruins or well preserved, with more vigour. Although he might have had imitators, he was without any rivals. In his imaginative work he allowed himself the fullest scope, and it was appreciated by his contemporaries. To understand him we must endeavour to go back to Rome in the eighteenth century. Tameless had become the characteristic of art. In PIRANESI the spirit of reaction was strong. If, instead of being an etcher, he had devoted his skill to painting, it is possible his name would now be better known. He attached himself to architecture, a class of work which can only appeal to a few, and as the few applied rigorous rules to what were free translations, PIRANESI has failed to please them. His position among lovers of art is therefore likely to be always uncertain.

The Additions to the Palace of Laeken for the King of the Belgians are expected to be sufficiently completed to allow of habitation next year. In order that there may be no disappointment, about 700 men are engaged under the direction of M. Charles Girault.

MATHEMATICS AND MANUFACTURES.*

I FIND myself confronted with the difficulties that prevent us in this country from succeeding as we used to do in the international struggle—a struggle the issue of which is daily becoming more and more a question of brains, of education, of skill and enterprise in manufacture, and finally of that great virtue extolled by the President of the United States, strenuousness.

It is the duty of everyone who sees the way in which we are being outstripped in the race to do what in him lies to scrape off the rust which is clogging our educational machinery. I now refer to the defects which hamper the intellectual progress of the majority of our youth. I believe the public school mathematics in this country stands on a level of its own, well below that of any other. In England, owing to our complicated system of weights and measures, which our Ministers and our Parliament dare not abolish for our own good, the scanty hours allowed for mathematics are devoted to the learning of tables which should never have to be learned at all, to compound reductions designed merely to puzzle but not to lead to any new step, and even if our present system were not futile enough, to learning lists of antique values which serve the useful purpose of giving the boys something to do. The result is that beyond having time to acquire a few elementary algebraical rules the boy is never introduced to algebra proper; he has no idea of algebraical reasoning; his trigonometry often does not exist, and the very sound or suggestion of co-ordinate geometry or of the differential calculus, which might be well within his reach, produces a shiver of dismay. Geometry is presented for the first time in the form of Euclid, a form as repulsive to most boys as it well could be. I must confess to having been attracted and not repelled by Euclid, but the boy does not care for time. Now that I look at Euclid again I have also to confess that any lingering regard for an old friend vanishes before the archaic language and the unnecessary circumlocution. If Euclid must be retained let it be translated into English, the English that any parent would use in explaining the ideas to his son; let it be illustrated by constant reference to real things so as to appeal to the boy who does not revel in the abstract. Let the ideas and the terms first be presented in the form of experiments and of measurements with instruments; let the schoolmaster dare to throw over the intolerable conservatism which prevents our doing anything ten times as well lest some item should prove to be a trifle worse; in fact, let us take some heed of the possibly extreme, but none the less genuine and valuable preaching of Professor Perry. I have so far referred only to the miserable use that is made of the odd hours grudgingly given to what is called mathematics. Is it any use to repeat the long-standing complaint of the way in which the schoolmaster insists upon overdoing his Latin and Greek under the belief that they are at least essential to intellectual development, if, indeed, they do not supply the only stimulus? A society is constituted they are essential to education as an extensive knowledge of Confucius is essential to an educated Chinaman, so that we may mix one with another, appreciate the works of our great authors, understand the same allusions and have the same kind of knowledge of the development of our civilisation. Few men of science, perhaps none, wish to see all of this, some of which is essential to a general education, abolished; all that we ask is that the schoolmaster shall not continue to impose upon the community the unbalanced learning which corresponds to mathematics and science without letters. The time given to classics is exorbitant; more must be reserved for those pursuits which draw out the habit of independent thought, creation and originality. I would be well if every schoolmaster could read an admirable article by James Swinburne on the two types of mind fostered by the two complementary types of education, but this buried in an inaccessible number of the *Westminster Review*.

The classic is unfortunately still in possession, and where as is still often the case, he is innocent of any appreciation of the educational value of post-Newtonian studies it is not surprising that he thrusts into odd moments the subjects he does not understand, and which he therefore despises, and the boys committed to his charge and living in such an atmosphere are half-ashamed of showing any interest in the science which is within their reach. It is almost impossible to believe that such can be the case, but I have referred to the impression to which the appointment of the first science master at my own school gave rise. I now refer to the contribution of a discussion on education but a year or two ago by that experienced teacher, Principal Griffiths. Fortunately our public schools are not the only ones in the country. Smaller and less fashionable schools pay more attention to education and suffer less from what, in defiance of all rule, I can only call didactic method.

* From the address of Mr. Charles Vernon Boys, F.R.S., president of the Mathematical and Physical Section of the British Association.

I am not aware that the result of this almost total exclusion of tabooed subjects in favour of Latin and Greek is producing a standard of classical attainment in our youth greatly in advance of that to be found in other countries, but it is certain that in history, modern languages, mathematics and science the product of our public schools is sadly deficient.

There is another point related to our deficient general scientific training on which I wish to offer some remarks, and that is in relation to manufacture. It is the fashion among some of our scientific people to talk of our manufacturers as if they were a very ignorant lot, and to suppose that one word from some professor who has never been outside a laboratory would be sufficient to put them right. Now in my somewhat varied experience I have had occasion to become acquainted with corners of our great manufacturing areas, and while my experience is small and not enough to generalise upon, it is nevertheless several times as great as that of some who are ready to adopt the superior attitude, but have none.

The loss of one industry after another is only too patent. In so far as this may be due to want of enterprise in our men of business we are not concerned with the cause in this section; in so far as it may be due to want of that little assistance which the fiscal arrangements in other countries make possible for our rivals again we are not concerned in this section; in so far as our patent laws are unique among those of manufacturing nations in allowing the foreigner to manufacture in his own country under the protection of our patent law, so that the most valuable school we possess, the manufactory, as well as the manufacture, is conducted to the advantage of our rivals—a point which I suppose it is unnecessary to commend to the notice of Mr. Chamberlain—with this, too, we have no concern in this Section; but in so far as this, or the want of enterprise or of foresight that leads to it is due to ignorance and to want of appreciation of scientific advance, we are very much concerned with it. If I may refer to my own limited experience, there is a lamentable contrast in the manner in which a great number of our own countrymen look at any proposition put before them and that in which the alert American does. It is useless to explain that which would be self-evident to a man with a moderate knowledge of chemistry and physics, such as our schools ought to supply, or for which they should at least lay the foundation, for the words have no meaning; they are merely words. He distrusts anything new; he has heard of a new process before that did not work out well; his experience on the Continent to him is no experience at all, for he believes the inhabitants in such distant parts of the earth are not capable of knowing as well as the enlightened Englishman whether a thing is properly done or not, and so he goes on as he did before, perfectly content. This attitude would not be possible with the most elementary understanding of common principles.

But there is another side to this picture. Anyone who has discussed any scheme with the board of directors, the manager, the engineer and the chemist of one of our great manufactories must have been struck with the concentrated ability there and in harness. It has often seemed to me that it is a great misfortune that our professors of mechanics, of physics and of chemistry are in so many instances precluded from a better acquaintance with the working of these great machines—a misfortune not for the works, at least directly, but for the professors, and more especially for their pupils.

Nowhere are scientific problems of greater complexity constantly having to be solved than in a great manufactory; nowhere is such concentrated talent necessary as in a works organised and carried on in competition with all the world. Look upon these as our most valuable schools, and the closer the touch between them and those whose province it is to teach, the better for the teacher and the pupil.

It is, perhaps, hardly desirable to mention any one where there are so many. I am tempted to dwell upon the problem which has been at last successfully solved by Parsons, this being the joint product of the school and of the works; but there is one picture—a contrast, I will not say of light and shade, but of colour and colour—to which I must refer. I remember in my early days, in the surroundings of a classical atmosphere, the general feeling of contempt for the manufacturer, the intellectually inferior creature who only made money, but who knew nothing of *τίππω* or *τέτυμμα*. I am not sure that some such feeling does not still exist among those whose horizon is limited to the Latin and Greek that they have learned—or should I say limited by instead of to? This recollection came back to me when not long ago I was visiting one of the best organised and most skilfully conducted works in the country—I mean Willans & Robinson—when I remembered that another great manufactory, conducted on American lines, was near by, and when across the road I saw the walls of one of our most famous English schools. I pictured the old contrast: on the one hand the conviction impressed upon me in a boy that there is something intellectually superior in the struggle with a paragraph of Xenophon or a page of Herodotus, while manufacture is merely mechanical, sordid and

base, with what I believe to be the reality on the other. I wondered in what spirit the erection of these works was viewed at the school and to what extent the high intellectual attainment there so essential and so evident is properly appreciated.

Of the last of the three headings, strenuousness, we have plenty, but at school it is most apparent in cricket and football, and in after life in various expensive ways of murdering defenceless animals.

However, a change is already beginning to be felt. The public schools no longer withhold the elements of chemistry and physics, and those who have benefited, even in small degree, are taking responsible places vacated by those who had no such opportunity. The numerous polytechnics are providing more serious instruction to thousands of our young men, and it may be hoped that in time even the official—I mean the mere official whose only conception of activity is centred in obstructing progress and enlightenment—will have some appreciation of things as well as of words.

RECENT DISCOVERIES AT SILCHESTER.

OUT of the 100 acres composing the site of the buried Roman city at Silchester, Hants, between eighty and ninety have already been excavated. This year's operations have been unusually successful, because they have brought to light the public baths of the city. The whole of the foundations have now been laid bare, the area being nearly 200 feet long and about 100 feet wide, and although everything down to the floor-line has been destroyed, there still remains enough to show the whole system and its arrangement. The baths are like those discovered at Uriconium, near Shrewsbury, but larger. The courtyard at the entrance, apodyterium, frigidarium, tepidarium, sudatorium and caldarium, with the hypocausts and remains of the hot-air flues can all be traced. It is evident that during the hundreds of years that these baths were in use many changes were made in the original design. This is particularly observable in the changes of floor level and in the alterations made in the size and shape of some of the rooms. For instance, in the frigidarium there are remains of a division wall built upon the tiled floor. In this room can be seen the lead pipe through which the water was drained off, while the floor and remains of the walls show the specially durable cement which the Romans generally used for lining receptacles for water or fire. In some places a cement floor is found, in others tile and in others brick laid in herring-bone fashion. Some excellent specimens of both coarse and fine mosaic work are also visible. At one end of the caldarium was found part of a fallen wall made of brick and flint, showing on the under side the plaster with which all the walls were covered both within and without. This fragment shows clearly the side of a window, which must have been square-headed. In almost every room are visible the pilæ which carried the floors. A number of bone pins, beads, styli, &c., were found, as well as portions of columns of different sizes, parts of a basin which must have been 8 feet or so across, and a very good specimen of a Roman altar, unfortunately not inscribed, and a handsome Doric capital. The efforts of the past year have also brought to light a number of sites of small houses. It is hoped that these discoveries will bring more contributions to the excavation fund, which has of late suffered from the deaths of some subscribers and other causes.

EXPLORATIONS AT CHESTER.

ON Saturday there was an excursion of the Liverpool Geological Association to Chester. Under the guidance of Mr. R. Newstead, curator of the Grosvenor Museum, who had kindly consented to take charge of the party, a visit was paid to the seed warehouses of Messrs. Dickson in St. John Street. In the cellars of these stands, *in situ*, a very fine specimen of the original Roman wall round the city. It is the furthest remains of this wall yet found to the south of the city, and is a specimen of massive but rough masonry. The stones are the sandstone Bunter of the district, and contain numerous pebbles, and a very striking feature of the wall was the cement which bound it, and seemed practically harder and stronger than the stone itself. This old wall lies about 10 feet outside the present wall, and a similar position exists in respect to the furthest remains of the old wall on the north-west to be seen on the Roodee near the grand stand. Mr. Newstead says that the present wall is altogether Mediaeval or modern, and does not by any means coincide with the original Roman wall, the direction of which is far from being accurately known. Leaving the walls the party proceeded to visit the various places in the city where Roman remains are to be found *in situ*, having been unearthed during the excavations required for city improvements in the past few years. In Northgate a descent was made into the cellars of a

large toyshop, and here lay some specimens of Roman pillars—bases *in situ*, shafts broken and lying horizontal, evidently extending under the shops lying nearer Eastgate, the cellars of which have not yet been excavated; and sundry capitals, of which there may be a doubt as to whether they belong to the bases there *in situ*, or have fallen from shafts further away. There has been much speculation as to what class of Roman building these columns represent, but the weight of opinion is in favour of their having formed part of the Forum. In Watergate, at the rear of a butcher's shop, was found another base and part shaft *in situ*, a class of building not known. In Bridge Street, during recent alterations to modernise an old Chester hostelry, numerous Roman remains were found, and to-day, hidden by a drawable curtain, one side of the bar parlour consists of sundry Roman pillars *in situ*. Similar pillars are found running at right angles a short distance away, and from the number of pieces of metalwork in various stages of completion found during the excavations it is conjectured that this is the site of some Roman workshops in bronze and other metals. A stroll across Bridge Street brought the party to a small stationer's shop, at the back of which, about seven steps down, was found a Roman bath in fair preservation. It was fed by a natural spring, and contained about 3 feet of very clear water. The hypocaust (heating chamber) beyond the bath was rather choked and ruinous, but the stone heating flues were still well defined.

A move was made to the Grosvenor Museum, but so much time had been spent in city explorations that only a hurried inspection could be made. It contains a small but admirably posed collection, and, as might be expected, Roman remains form one of its strong points. There is an array of inscribed stones (tombstones) principally relating to officers of the 20th Legion, which seems to have been the crack Roman legion of the period. Many of the dates are uncertain; some, however, are indisputably fixed at 74 and 78 A.D. The museum authorities secured the fine collection of ancient British, Roman and Saxon relics gathered on Meols and Leasowe shore by the late Mr. Potter, and it has been admirably mounted and cased by the curator. A cordial vote of thanks was given to Mr. Newstead for his efforts.

EXCAVATIONS AT CAERWENT.

A DESCRIPTION was given at the British Association by Mr. T. Ashby, jun., M.A., F.S.A., Assistant Director of the British School at Rome, of the explorations at Caerwent. He said:—The Romano-British city of Venta Silurum, the site of which is now occupied by the village of Caerwent, Monmouthshire, five miles west of Chepstow and eleven miles east of Newport, is only mentioned by this name in the Antonine Itinerary and by the Geographer of Ravenna. In the former it appears as a station upon the Roman road from London *via* Bath to South Wales. In the classical authors it is not spoken of, though the tribe of the Silures is mentioned by Tacitus; but an inscription recently discovered in the centre of the city shows that it was the centre of the tribal organisation under which the Silures lived in Roman times. The text is as follows:—*... leg(ato) leg(ionis) ii aug(ustæ) proconsul(is) provinc(ia)e Narbonensis leg(ato) Aug(usti) pr(o) pr(atore) provinc(ia)e Lugudunen(sis) ex decreto ordinis respublica civit(atibus) Silurum.*

The external walls of the city are still clearly traceable. They form a rectangle of about 500 (east to west) by 400 (north to south) yards, and on the south side are preserved to a height of some 20 feet. Some remains of the east and west gates still exist, while the north gate is preserved up to the spring of the arch, and shows signs of modification. Within the wall and parallel to it a mound of hard clay has been discovered in many places, which is believed to have been the original fortification of the city; whether its origin is military or civil is a point as yet uncertain.

Excavations are still in progress, and, if circumstances permit, may be carried on for several years more, as the greater part of the site is unoccupied by buildings.

The ancient city appears, at one period of its existence at any rate, to have been divided into twenty *insulae*. The modern highway, which runs from east to west through the centre of the site, follows the line of the ancient road, and at almost equal distances north and south of this ancient roads have been brought to light. There seem to have been four roads running from north to south, of which the easternmost alone has not yet been discovered in any part of its course. It is obvious, however, that our statements on this point must be subject to reserve, inasmuch as much further excavation remains to be done.

The buildings which have been brought to light consist chiefly of private houses, and some of these present a ground plan which appears to be unique in England, having the rooms arranged round all the four sides of a rectangular courtyard. The walls are strongly built of blocks of limestone, and in

some cases the painted plaster upon the walls is found *in situ* in good preservation. Some interesting mosaic pavements have been found.

A large building near the north gate (so far only partially excavated) may have had some public character, and a little to the east of this gate an amphitheatre (apparently of late date) has recently been discovered within the city walls. So little is it preserved that it must be supposed to have been mainly of wood; the arena wall, which exists almost in its entire, encloses an oval the diameters of which are about 145 and 125 feet.

The smaller objects include a roughly sculptured head of sandstone, probably of some deity, while pottery, bronze and iron objects, &c., are found in profusion. Some of the coloured enamel is especially good.

EXPLORATIONS AT KNOSSOS.

A COMMUNICATION from Mr. Arthur Evans was read at the meeting of the British Association. He said:—

It had seemed to the excavator possible that this year's campaign in the prehistoric palace at Knossos might have definitely completed the work. But the excavations tooled wholly unlooked-for development, productive of results of first-rate importance both on the architectural and general archaeological side, and calling still for supplementary researches considerable and indeed, at present, incalculable extent.

The search for the tombs, which was principally carried out in the region north of the palace, only resulted in the discovery of a necropolis of secondary interest in a much destroyed condition. At the same time remains of houses were brought to light, going back to the earliest Minōan period, and proving the continuous extension of the prehistoric city for a distance of over a quarter of a mile north-east of the palace.

At its north-western angle the palace area itself has gained a monumental accession. The building proved to extend beyond the paved court which lies on this side, and excavations here brought to light what can only be regarded as the real theatre. This consists of two tiers of limestone steps, eight in number and 30 feet in width, on the east side, varying from six to three, with an extension of 50 feet on the south, while between the two is a raised square platform. The steps, low seats and platform overlook a square area where the shows must have taken place. Owing to the made character of the ground to the north-east the limestone slabs on that side have either disappeared or were brought out in a much disintegrated condition, and it was found necessary for the conservation of the rest of the monument to undertake considerable restoration. This was, however, facilitated by the fact that the lower courses of the outer supporting wall were throughout preserved. The theatre would have accommodated about five hundred spectators. A somewhat analogous feature was discovered on the Italian mission, bordering the west court of the palace at Phaistos, but the arrangement at Knossos is much more complete, and gives us the first real idea of the theatre in prehistoric Greece. The pugilistic shows represented on certain small reliefs at Knossos and Hagia Triada and the traditions of the "dancing-ground" of Ariadne, executed by Dædalos for Minos, may throw a light on the character of the performances in this theatrical area.

Between this building and the west court of the palace area was explored containing a very complex mass of constructions representing at different levels every age of Minōan culture, and apparently belonging to a sanctuary connected with the Cretan cult of the Double Axe and its associated divinities. Painted pottery and other objects were here found with designs referring to this cult. Among other discoveries were highly decorative polychrome vases belonging to the Middle Minōan period, more or less contemporary with the twelfth dynasty of Egypt. Of later palace date was an extremely important deposit consisting of a bronze ewer and basins, with exquisitely chased ornamentation in the shape of lilies and various kinds of foliage.

On the north-east of the palace, built into the side of a hill, was uncovered a remarkably well-built house, constructed largely of fine gypsum blocks, which appears to have been of the kind of royal villa. Here, as in the domestic quarters of the palace, the upper storey is also well preserved, and there are two stone staircases, one with a double head. On a platform here was found a magnificent painted jar containing remains of papyrus plants in a new technique. The principal chamber was a columnar hall with a tribuna at one end, backed by a square apse containing the remains of a gypsum throne, the whole presenting an extraordinary anticipation of the style of the basilica.

Within the previously uncovered palace area supplementary explorations of lower levels have been carried out on an extensive scale. A whole series of deep-walled chambers, perhaps representing the dungeons of an earlier palace, have been opened out. Excavations below the floor-level of the

live Press area have brought to light the floor-levels of more ancient chambers containing exquisite painted pottery belonging to the Middle Minóan period and sealings throwing an interesting new light on its glyptic art and the early "pictographic" type of script. Beneath the pavement of the Long gallery of the magazines a continuous line of deep stone cists (sasses) was discovered, and from the remains of chests laid with glazed ware and crystal mosaic, accompanied by quantities of gold foil, it is clear that these repositories had once contained treasure. Near the east pillar room a small cist was found beneath the floor-level containing vases and other objects belonging to the earliest Minóan period that immediately succeeds to neolithic, and affording the first collective view of a representative type series of that period. The character of the glazed beads found in this deposit seems to indicate relations with early dynastic Egypt. The exploration of the neolithic stratum which to a depth of 25 feet underlies those of the "Minóan" buildings was continued, several new shafts being dug within the palace area. The successive phases of the local neolithic culture are thus becoming more clearly defined.

The investigation of the cause of a slight depression in the pavement of a store-room immediately north-east of the east pillar room led to a discovery of extraordinary interest. Beneath the pavement and a small superficial cist belonging to the latest Palace period were found two spacious repositories of massive stonework containing, in addition to a store of early vases, a quantity of relics from a shrine. These had evidently been ransacked in search for precious metals at the time of the construction above, but a whole series of objects in a kind of glaze like the so-called Egyptian "porcelain," but of native fabric, had been left in the repository. The principal of these is a figure of a snake goddess, about 14 inches high, wearing a high tiara up which a serpent coils, and holding out two others. Her girdle is formed by the twining snakes, and every feature of her flounced embroidered dress and bodice is reproduced in colour and relief. A finely modelled figure of a votary of the same glazed material holds out a snake, and parts of another are also preserved. The decorative fittings of the shrine include vases with floral designs, flowers and foliage in the most naturalistic imitations of nautilus and cockles, rock-work and other objects, all made of the same faience. The central aniconic object of the cult, supplied in the formerly discovered shrine of the Double Axe, was here a marble cross of the orthodox Greek shape. The cross also occurs as the base of a series of seal-impressions, doubtless originally belonging to documents connected with the sanctuary found with the other relics. A number of other seal impressions deposited with these show figures of divinities and a variety of designs, some of them of great artistic value. An inscribed tablet and clay sealings with graffite characters was also found, exhibiting a form of linear script of a different class from that of the archives found in the chambers belonging to the latest period of the palace.

In view of these important results it is obvious that further investigations beneath the later floor-levels must be carried on throughout the palace area. The search for the royal tombs is also to be continued. The region about the theatre and the north-west sanctuary still requires methodical excavation on a considerable scale, and the neolithic strata call for continued investigation. The need for further assistance from those interested in the results already obtained is still urgent.

YORKSHIRE ARCHÆOLOGICAL SOCIETY.

THE members of the Yorkshire Archæological Society made an excursion on the 9th inst. to Kirkby Hill, Boroughbridge and Aldborough.

The first place visited was Kirkby Hill, or Kirkby-on-the-Moor, Church. It is a very quaint little structure, which was presented to Newburgh Priory, now the residence of Sir George Wombwell, by one Roger de Mowbray. The nave measures 24 feet in length by 14 feet 10 inches in width. The walls of the tower are almost 3 feet in thickness, and the base of the nave are pretty nearly as substantial. Many old sculptured stones are preserved in the building, and the party shown amongst others a Roman slab, with an illegible inscription on it, which was built into the south-west angle of the tower, and was nearly 2 feet thick. It was pointed out that many of the quoins and large stones built into the tower were also of Roman workmanship, and that the cap and base of a pillar built into the west wall of the porch was a Roman hypocaust. Another object of interest was a fine old press, dated 1699.

The famous monoliths, known as the Devil's Arrows, at Boroughbridge, were next visited. Mr. Wm. Brown acted as guide, and said that it was not known when or how these monster stones came into their present position. Two of them are 22½ feet high and 18 feet in circumference, and the third

18 feet high and 22 feet in circumference. They are of limestone grit, which is found in the neighbourhood, and are now three in number, but Leyland says that there were "four main stones" in the fifteenth century. The tops of these stones are scarred and channelled by the rain, and the bases, which are buried in the ground some 4 to 6 feet, bear marks of rough dressing. The theory was advanced that they might be the remains of a Druidical temple, like Stonehenge, but this was discounted by a number of the members on the ground that the stones are in a straight line and too far apart to have been a portion of a circle, which in that case would necessarily have been so large.

After inspecting some ancient fragments built into the vestry wail of Boroughbridge Church, the party had luncheon in a tent erected in a field not far from the church. After luncheon they proceeded to Aldborough, the ancient Isurium Brigantum. The old church, dedicated to St. Andrew, was the first place of interest. Mr. Brown again acted as guide. He directed the party to the old brass of William de Aldeburgh, circa 1360, which was let into the wall of the north aisle. He noticed out the various points of interest in the brass, including the peculiar shield worn on the left arm, the royal spurs, and the small dagger which was used to give the finishing stroke to a foe. He said that it was evident from the armour that the period was that of the Black Prince. Another thing which attracted a good deal of attention was a seventeenth-century monument, in bad condition, to William, son of Richard de Aldeburgh. In the middle passage is a curious stone slab placed there in memory of James Brooke, of Ellenthorpe, twice Lord Mayor of York, who died in 1675, and also of Priscilla, his wife, who died in 1692. At the west end of the north aisle a figure of Mercury, of Roman workmanship, was pointed out by the guide.

The old Roman town of Isurium Brigantum was then explored. Mr. Haverfield, the well-known authority on Roman remains, acted as guide, and told the party that Isurium Brigantum, or Roman Aldborough, was probably occupied in the first instance by a detachment of soldiers from the garrison at York. The people who had lived at Aldborough, however, were probably not so much soldiers as civilians. They were engaged in trades and agriculture, and he thought that they were principally natives who had adopted Roman customs and Roman manners, and lived in Roman houses, with two or three of their own Romanised nobles at their head. Most of them, he conjectured, spoke Latin, and that was the case right down to the domestic servants and labourers. He drew a parallel between these Romanised settlements and our settlements in India.

A great deal of the old town of Isurium Brigantum lay where Mr. A. S. Lawson's house and grounds now are, and by the permission of that gentleman the party visited the excavations and the museum. The old town enclosed within its walls a roughly rectangular area of 60 acres. Possibly at first it was a British town of the Brigantes, which the Roman legions were intended to overawe. A few tiles which have been discovered may indicate the presence in its early days of a detachment from the Roman fortress at York, where the ninth legion was quartered till about A.D. 115, and the sixth legion from about A.D. 120 onwards. But the garrison must have been soon removed, and during the second, third and fourth centuries traces only of the comfortable civilian life of a county town can be found. The houses so far excavated seem to have been of the type common in Britain. They were warmed with hypocausts adorned with painted wall-plaster and floored with mosaics, of which several very fine specimens have been discovered. One mosaic which the party inspected was said to represent a muse seated on Mount Helicon, with the name of the hill inscribed in Greek, and the guide said that probably this was the only tessellated pavement bearing a Greek inscription in England. In the museum many ordinary domestic articles of Roman life are preserved, including Samian and other pottery, fibulae, glass, lamps, &c. Inscribed and sculptured stones, including an altar to Jupiter of the Matres were seen, and also two sculptures of Mercury. The excavated walls were also viewed, and after the inspection the party were entertained to afternoon tea by Mr. and Mrs. Lawson. After tea Sir Thomas Brooke expressed the thanks of the members to Mr. and Mrs. Lawson for their hospitality.

The Exhibition of the remaining works of the late Mr. Phil May, which include a large number of his drawings for *Punch*, will be held in about a fortnight's time at the Leicester Galleries in Leicester Square. The collection will be thoroughly representative of his work, and many unpublished drawings and sketches in colour will be shown, in addition to a series of portraits of eminent politicians which Mr. May only completed shortly before his death. The exhibition will take place in the Hogarth room, which Messrs. Ernest Brown & Phillips have just added.

NOTES AND COMMENTS.

IN the Pitti Gallery, Florence, there is a *Concert*—two monks playing, who were at one time supposed to be LUTHER and CALVIN, with a youth listening to them—which some experts ascribe to GIORGIONE and some to TITIAN. The painting has been restored perhaps more than once, and the process has increased the difficulty of identification. Opinions on the authorship are equally divided, and either master would have been competent to produce the work. A new theory has been lately advanced on the subject. It is suggested that the general idea of the scene was GIORGIONE'S, but that the middle figure was painted by TITIAN, and the excessive dimensions of the black mantle are taken as a sign that something had to be concealed. It may be some injury to the original work. If the two masters can be accepted as co-operating, there would then be grounds for believing that a third master may have put in the side figure. The discussion about the work is another instance of the influence of MORELLI'S scepticism. Pictures are now scrutinised more microscopically than was formerly considered allowable, and the canvas and colours receive as much attention as the handling. The doubtfulness of the pictures may compel some spectators to take more interest in them; but the majority will feel that time is too precious to be wasted over uncertainties.

THE sanitary condition of Prussian schools is not so satisfactory as is desirable, especially when judged by the modern standards found in other lands. In 1896 there were, according to the returns, over 36,000 elementary schools, with an attendance of about 5½ millions of children. The medical officers of the various districts are supposed to report from time to time on the state of the school buildings. But in several cases it is found there is laxity in performing the examination. Instructions have lately been issued which it is expected will put an end to perfunctory visitations. All new schools will have to be carefully examined and tested. The same rule will apply whenever there are additions or alterations which are likely to be risky. Attention will have to be given to the means to ensure cleanliness among the pupils. Shower-baths will be necessary not only in schools in towns, but also in those in the country. It is not unusual for the teacher's residence to form part of the school. Henceforth there must be a separation between the two to prevent illness which might break out in the teacher's family attacking the children in the classrooms. The heating and ventilation of the buildings will no longer be optional on the part of local authorities.

THE teaching of architecture in colleges and universities is a subject about which authorities differ. It is difficult, no doubt, to amalgamate the special courses with others which appeal to the ordinary students. Moreover, precedent, which prevails in most educational institutions, does not sanction the arrangement. The chief obstacle is really one of finance. Benevolent people who give large sums for education are commonly indifferent to the fine arts, and particularly to architecture. An arrangement has been entered into in Leeds which suggests what can be done in other places when funds are not forthcoming to establish a chair or chairs. The architectural classes of the local institute of science, art and literature have the approval and support of the Leeds and Yorkshire Architectural Society, and are framed with the definite object of preparing students for the preliminary, intermediate and final examinations of the Royal Institute of British Architects. The lectures will be illustrated by a large collection of casts, specially large photographs, lithographs and numerous lantern slides. There are preliminary, intermediate and final courses. In the classes of design during the coming session there will be visits by Mr. BUTLER WILSON, Mr. C. B. HOWDILL, Mr. G. F. BOWMAN, Mr. G. B. BULMER, Mr. H. S. CHORLEY, Mr. W. H. THORP, and Mr. E. J. DODGSHUN. The fees are very moderate.

ILLUSTRATIONS.

DESIGN FOR HULL TOWN HALL—PROPOSED EXTENSION.
THE proposed arrangement is shown on the plan. It was considered a waste of money to adapt the old buildings, as they were out of repair. The basement would be utilised for strong rooms and storage, and the internal walls retained where possible on the ground floor, the cornices and other sound stones being used in the new structure. The law courts could be entirely completed without interfering with the present court. According to description the concrete in foundations and under basement floor is to be of lime and ballast in the proportion of 1 to 8. Mortar to be composed of lime and sharp sand in the proportion of 1 to 3. Basement floors to be paved with patent granolithic paving. The walls to be constructed of sound well-burnt bricks. The exterior and entrance walls to be faced with stone from an approved quarry, the interior columns to be marble. The floors to be fireproof, composed of hollow tiles and steel joists covered with cement concrete in the proportion of 1 to 6, the corridors paved with mosaic. The entrance halls would have black and white marble, other floors covered with deal. Areas and vanes with white glazed bricks, the walls of cells salt glazed bricks, and all lavatories covered with opalite. Façades to corridors, and also office stairs, service-rooms and kitchens. Drains to be approved stoneware sockets, jointed drain pipes, laid to falls in cement concrete and jointed in cement, with manholes and traps. The flat roofs to be constructed of steel joists and hollow tiles covered with cement concrete and asphalt; other roofs covered with slates bedded in expanded metal, lathing and cement. The design is by Mr. J. HATCHARD SMITH, F.R.I.B.A., of Moorgate Station Buildings.

BILLIARD-ROOM IN CARNICK HOUSE, AYR.
THIS billiard-room was designed for Mr. T. C. ARTHUR, Carnick House, Ayr, being part of considerable alterations made to his house under the direction of Mr. J. A. CAMPBELL, architect, Glasgow.

PORTIONS OF MEMORIAL CHANCEL FITTINGS IN ROTHBURY CHURCH, NORTHUMBERLAND.
THE illustration shows a portion of some chancel fittings recently constructed in the above church. The vestry screen is part of the gift of Lord and Lady ARMSTRONG as a memorial to the late Lord and Lady ARMSTRONG. The choir seats, a portion of which is shown, were put up by the YOUNG family in memory of late Canon YOUNG, rector of Rothbury. The Bishop's confirmation chair is the gift of Miss E. WILKINSON, Sebergham Castle, Cumberland, and formerly of Rothbury. The tracery, &c., is more delicate in execution than shown on the sketch. The architect is Mr. ARTHUR PLUMMER, F.R.I.B.A., of Newcastle-on-Tyne.

HOUSE AT BYFLEET, SURREY.
HOUSE IN DARTNELL PARK, BYFLEET, SURREY.
THESE houses are now being built in Dartnell Park, Byfleet, for Mr. F. C. STOOP, the owner of the estate. The illustrations show the preliminary designs which differ in some respects from the contract drawings. The larger house has been increased by about 5 feet at the whole length of the garden front, part of this forming a verandah entered from the drawing and morning room, and the remainder being added to the morning-room, dining-room and servants' hall; bedrooms 2 to 5 are enlarged. In addition to the accommodation shown on the two plans, four bedrooms, together with two rooms, &c., are provided on the second floor. The walls will be panelled to the height of 7 feet. The smaller house contains six bedrooms on the first floor and three on the second. The external walls are faced with red bricks to the top of the plinths, and above this covered with cement roughcast. A terrace will be formed along the garden front of each house about 3 feet above the existing surface, and steps will lead down from the lawn. The two houses are being built by Messrs. J. GARRETT & SON, of Balham Hill, and the paneling and mantelpieces will be carried out by Mr. JOHN WHITE, of the Pyghtle Works, Bedford. The architect is Mr. G. L. SUTCLIFFE, A.R.I.B.A., of the firm of Messrs. SUTCLIFFE & SUTCLIFFE, 11 Argyll Place, W.

REDBOURNE AND HEMEL HEMPSTEAD.*

WHEN the imperfect history we have of our own country commences, Britain was peopled by the Celts, a branch of the Aryan family. The Aryans were a very primitive race, heard of in Central Asia, from whence they migrated into Europe. From them are believed to have sprung the Hindoos, Persians, Greeks, Latins, Celts and Anglo-Saxons; and among the Celts who came from Western Europe, the Erse, Manx, Cymric and other tribes are included. Many of the names the Celts gave to the physical features of the country remain with us to-day, and among them may be mentioned the river Ver, which rises in the chalk hill on the east side of St. Albans and runs through Redbourne; the Rev. H. Fowler, M.A., too, regards Redbourne as being derived from the Celtic word Reidh, a piece of moorland lying against the hills. Salmon's definition was somewhat similar, "Aubury, or Arbury Camp, is accepted as of Celtic origin. It is now known as The Aubreys, the space outside the earthworks to the extreme north being termed the Aubrey, and the northern half of the enclosure Middle Aubrey; the southern portion is called New Swathe, a more recent designation. It has been pointed out by the Rev. J. H. P. L.L.D., that Aubury Camp is exactly similar to the camps described by Mr. Warne in his work on "The Celtic, Saxon and Danish Camps of Dorsetshire," and it also bears a close resemblance to the old earthworks at St. Albans. Measurements of Aubury, as taken by Dr. Griffiths, are 440 yards from north to south and 415 yards from east to west. The camp is of an ovate shape, and encloses about 100 acres. The fosse is from 9 to 13 feet deep, and on the north and south sides, where the mounds are double, it is from 45 to 60 feet wide at the top. Towards the north end the ground is higher, and at the lowest part the ditch is deeper and wider

curator, however, took possession of the whole, and when Boadicea, the widowed queen, protested he ordered her to be scourged, and he violated her daughters. Gathering her forces together she proceeded to the Roman municipium, which with fire and sword she devastated in 61, and Redbourne may have been traversed by the contending armies; it certainly was by Suetonius Paulinus. The triumph of the unfortunate queen, as we know, was but a brief one, and when eventually her forces, through fear forsook her, she ended her life with poison.

Verulamium was soon rebuilt, the site was strengthened, and important roads were formed or improved, including the Watling Street, which twice crosses the Ver at Redbourne. No Roman remains have been found at Redbourne, but at Hemel Hempstead on the road to Boxmoor a Roman villa was discovered, and glass, pottery and Roman ornaments are occasionally found there.

About A.D. 304, during the persecutions under Diocletian, a Christian priest was sheltered at Verulamium by a Pagan named Albanus. The pure life of the man and his devotion to the Almighty so impressed Albanus that he became a convert. The Governor of Verulamium hearing that a Christian was hiding sent soldiers to arrest him, but Albanus, donning the priest's gown, gave himself up and permitted the clerk to escape. The Governor was at the altar sacrificing when Albanus was taken to him, and he commanded him to sacrifice or suffer death. Albanus confessing himself a Christian was scourged and executed on a wooded height named Holmhurst, on the opposite side of the Ver. The priest endeavoured to escape to Wales, but was overtaken and brought back with some comrades to Redbourne Heath, where they were martyred, and in two graves, according to a legend, they were there buried.

After nearly 400 years' sway the Romans left England, and

REDBOURNE CHURCH.

HEMEL HEMPSTEAD CHURCH.

everywhere, probably as a reservoir. On the western side of the entrance in the middle of the fosse, from a high rampart runs southward. At the extreme south end of the double vallum has been destroyed for the construction of Foster's Farm, and at the east and north-east parts levelled for cultivation. No antiquities of any kind have been found in the Redbourne Camp, for the probable reason that they have not been searched for, but permission was granted for excavations to be made, and it is believed that the work will be undertaken by the St. Albans Archaeological Society.

The reason to suppose that the Oppidum, or chief seat of Cassivellaunus, was at Verlam, which, like Redbourne, is in the hundred of Cashio. There he was pursued by Julius Caesar who captured the town by assault, and probably Redbourne Cassivellaunus made his escape. Caesar was at the town but a short time, however, and Verlam for 100 years was a British city of considerable im-

portance. The Saxons came, and from one of their tribes—the Hartings of Hertfordshire takes its name.

Offa, king of the Mercians, had murdered Ethelbert, king of the East Angles, and in 793, being desirous to expiate his crime, he was commanded in a vision to seek the body of St. Alban and to found a monastery there; so with Humbert, archbishop of Lichfield, and the Bishops of Leicester and Lindsay, he proceeded to Verulamium, and a light guiding them the body of the proto-martyr was found. On the site Offa built a church which he dedicated to St. Alban, and it is believed that the church at Redbourne was also erected in his honour. At the other side of Redbourne Heath or Common a chapel of St. James was built, possibly for the use of the pilgrims who annually assembled by two mounds on the heath, which were known as the Hills of the Banners, and walked in procession to St. Alban's shrine chanting Litanies as they went.

The next important point in the history of Redbourne was probably in the time of Edward the Confessor, when Abbat Leofstan improved the Watling Street by constructing two bridges over the Ver at Redbourne, and then we read that William the Norman being opposed by Frederic, the last Saxon abbat, for a time took possession of Redbourne. Leofstan had felled trees and blocked the road with them. And now it may be as well to glance at the Gesta Abbatum and the record of the survey made by the Conqueror. At Hemel Hempstead there were two manors and they were differently spelt, the one entered as Hamelamstede, meaning the thrifty village station, belonged to the Saxon kings; the other, spelt Henammestede, the high village station, was owned

by Mr. W. Harradence and Mr. J. Stanley read before the members of the Upper Norwood Athenaeum.

by a Danish noble named Sexi. The Danish portion was given to St. Albans Abbey, the King's portion to Earl Moreton, half brother of William. This eventually passed to Edmund, Earl of Cornwall, the son of Richard, king of the Romans, and by him in 1277 it was granted to the College of Bons Hommes, Ashridge. The Manor of Redbourne was owned by Egelwyne the Swart—the swarthy we might term him—and Wynefed his wife, and by consent of Edward the Confessor and his Queen Editha, they granted it to the abbots of St. Albans. Of the hides, virgates, carucates, mills, cattle and hogs it is hardly necessary to speak.

In the reign of Henry II., about 1178, the proto-martyr appeared in a vision to an elderly burgess of St. Albans, named Robert, who followed the saint to Redbourne Heath, where he showed him the two hillocks called the Mounds of the Banners, and said, "That one contains the relics of my master." Abbot Simon of St. Albans had the mounds opened, and the remains of the converter of St. Alban, with his disciples, were found. The relics were carried to the high altar at St. Albans, the shrine of St. Alban being brought out to meet them. There being no record of the name of the clerk, he was termed St. Amphibalus, meaning the holy cloak. His shrine was erected in the nave, and in the retro-choir an altar was dedicated in his honour. In connection with the little chapel of St. James, a small priory of Benedictine monks was founded in honour of the Blessed Amphibalus and his friends, and in 1219 the reverence for the saint had so increased that Redbourne Church was rededicated to him. The priory was only for four monks, who had their food sent from St. Albans; no cemetery was attached, and the dead brothers were taken

BURY RUIN.

through St. German's Gate for burial in the monastery. Newcome states that in 1347, although the number of the monks at St. Albans had been reduced by plague, there was difficulty in obtaining food for them, so Thomas de la Mare, the abbot, sent sixteen of them to dwell at Redbourne; he also sent clothing and furniture and had additional rooms built at the priory, including a study for himself.

With the Wars of the Barons Redbourne is associated, for in 1217 the army of the Barons and the French, numbering 600 knights and 20,000 soldiers, set out from London to relieve the Castle of Mount Sorrel in Leicestershire. On May day they passed through Redbourne, where they pillaged the priory and stripped the monks of their habits.

In December 1290 a solemn procession passed through Redbourne, when the sorrowing Edward I. bore the embalmed body of his queen to London. Along the route from Lincoln to Westminster the twelve Eleanor crosses were afterwards erected.

On October 10, 1323, just after the celebration of mass in St. Albans, two Norman piers on the south side of the nave fell outwards, and shortly afterwards the roof gave way; not a soul was injured, and to the presence of the relics of St. Amphibalus the congregation attributed their preservation.

In the Wars of the Roses Redbourne played a part, for the struggle commenced in 1455 with the battle of St. Albans, and at the second battle in 1461 Redbourne Church was greatly injured and turned into a stable by Margaret of Anjou's forces.

As we have already seen, Hemel Hempstead and Redbourne were the possessions of the Church, and at the Reformation they were seized by Henry VIII. The shrines of St. Alban and St. Amphibalus were destroyed and the relics were scattered, and we may suppose the priory at Redbourne was demolished. Facts relating to Hertfordshire are not always to be obtained, for a fire at Westminster in 1731

injured the Cottonian Library, and the original roll of the survey of the county made by Henry VIII. was lost in the First Fruits Office. It may be interesting to note that in the shrine of St. Alban, which was reconstructed by Mr. Jackson about 1872, there is a carving of the decolletage of St. Alban within the tympana at the west end, while at the east end the scourging of St. Amphibalus is represented. Portions of the shrine of St. Amphibalus were also discovered and pieced together. In the screen erected by William Wallingford, as now restored, the figure of St. Alban is placed in the niche on the north side of the reredos, while the companion niche on the south is occupied by St. Amphibalus wrapped in his cloak.

The Manor of Redbourne was retained by the king, and James I. granted it for the use of his son Charles. During the Commonwealth it was conveyed to Sir Thomas Meanley, Gorbamby, and it eventually passed, through Sir Henry Grimston, to the Earl of Verulam, and during the Commonwealth Redbourne Church was injured by the Ironsides.

The Manor of Hemel Hempstead, formerly the property of the abbots of St. Alban, was given by James I. to his son Henry, and then to his son Charles, Prince of Wales. Restoration Charles II. received it, and granted it to his son, Catharine of Braganza. The portion possessed by the Rector and Convent of Ashridge was known as the Bury. Bury Sted. In 1535 it was granted by Henry VIII. to an auditor, John Waterhouse. Four years later Waterhouse invited the king to a grand entertainment at the Bury, and obtained from him the charter, incorporating the town under the title of the Bailiff and Inhabitants of Hemel Hempstead. Tradition states that the charter making the town a Bailiwick was announced from the little room above the gateway. Cussans suggests that the architecture is of the date; a portion may be, but the gateway has obviously been repaired, and the flintwork one may readily regard as a Tudor.

The church of St. Mary at Hemel Hempstead was built in 1150. The chancel roof is groined, and springs from Norman columns with square capitals of different designs. The tower is supported by four horseshoe Norman arches; the west doorway is Norman, and Norman moulding is seen in the tower windows. On the west side of the south aisle there is a brass to Robert Albyn and his wife dated 1480. In the north aisle a stone 6 feet long by 2 wide commemorated Thomas de la Mare, whose extraordinary height and spare body showed that he had to reach Heaven. The church was restored in 1888, when the mural decorations were repainted and coloured.

Redbourne Church is now known as St. Mary the Virgin. The dedication of many churches was altered in the reign of Henry VIII., and it seems probable that this was one of them. The present church is believed to have been built about 1150. The Norman work was unaltered until the Decorated style was built. The Norman arcade remaining on the north side of the nave consists of three round columns with fluted capitals supporting semicircular arches, around which there is a simple billet moulding. The south side, owing to damage done in the time of Henry VI., was rebuilt by John of Wheathamsted, abbot of St. Albans. The parapet on the north aisle consists of brick sunk panels under small trefoil arches with perpendicular mouldings. In the south wall there is a double sedile, and an Easter sepulchre on the north side. The carved oak screen is remarkably good, and is the only example of a groined and canopied screen in the county. There are brasses to members of the Peckham family and to Sir Richard Reade.

In the compilation of the above paper reference is made to the writings of Sir William Dugdale, Dr. John Edwin Cussans, the Rev. Mackenzie Walcott, Mr. Thorne, A. J. Foster, M.A., the Rev. Baring-Gould, the Canon Davys, M.A., the Rev. H. Fowler, M.A., the Rev. Griffith, LL.D., Sir Bernard Burke, W. D. Whitney, Wedlake Brayley, John Britton, Thomas Frost, the Rev. W. Hunt, the Rev. Thomas Perkins, M.A., and others. The author is also indebted to the Rev. Lewis Browne for valuable information and other kind assistance.

The illustrations are from photographs by Mr. C. W. and Mr. H. Virgoe.

The peculiar shaped church at Mundesley which is in ruins has given place to a more modern but much more picturesque building, part of the ruins being left as a reminder of the former church. Opportunity was taken in connection with the restoration to enlarge the church, which has been opened on Sundays during the height of the holiday season, and has been opened just in time for the influx of visitors to the seaside resort. Mundesley also possesses a mission church, and a Wesleyan church, both of them, as is the case with the parish church, facing the road from North Walsham to Mundesley which runs through Mundesley.

WATER SUPPLY.*

everyone a plentiful supply of good water is not only a luxury, but almost a necessity of existence, yet how few amongst the more intelligent of the millions who are doomed to find such a supply ready to hand at the nearest have more than a very imperfect notion of the works that are to be constructed to obtain it, or the daily care and attention given to secure and maintain its purity, to insure its distribution, and to prevent its waste by careless, ignorant, or reckless consumers. It may, therefore, not be out of place that when the chair of this section of the British Association happens, as now, to be occupied by one whose professional life has been largely associated with waterworks, that he should address you on that subject, and direct your attention briefly to some of the main points of waterworks construction and management. In following that course I shall, however, necessarily have to say what is already well known to at least a portion of my audience, on whose indulgence I must therefore rely.

Water supplies may be divided into two main classes, namely, "Gravitation" and "Pumping." In some instances a combination of gravitation and pumping is resorted to, especially in those cases in which the more elevated portions of the district to be supplied are situated above the gravitation level. In selecting a suitable source of supply the main points for consideration are the quantity and the quality of the water. The quantity should be such as will not only suffice to meet the requirements throughout the most protracted periods of drought and frost of the existing population to be served, but also provide for the probable growth of that population for a reasonable number of years to come. The quality of the water selected should be the best that can be obtained, due regard being given to considerations of expense. The question of altitude being sufficient to permit of a supply by gravitation is far less moment than those of quantity and quality, and the difference in cost between water derived by gravitation and that obtained by pumping is, in the United Kingdom, generally supposed; indeed, contrary to popular opinion, gravitation water is frequently more costly than pumped water, owing to the much greater capital outlay usually incurred in the construction of the works for storing and conveying it.

Waterworks may be divided into three classes, namely, those in which water is taken directly from a spring or stream, those in which it is taken from a natural lake, and those in which the surface level of the water is usually raised so as to increase the capacity of the lake as at Thirlmere, and there are numerous cases in which the water of a spring is collected in an artificial reservoir generally formed by the construction of an earthen or masonry dam across the valley through which flows the stream to be taken.

In the more populated portions of England it is becoming more and more difficult to find an unappropriated gathering ground available as a source of water supply. The gathering ground or drainage area as it is frequently termed, should be free from human habitations and other sources of pollution, or any pollution arising therefrom should be of being efficiently disposed of by removal from the gathering ground or otherwise.

The gathering ground must also possess a site suitable for the construction of an impounding reservoir. When this has been selected it next becomes necessary to ascertain the amount of the available rainfall, as recorded by rain-gauges in the drainage area or its immediate vicinity, or where it is not available, as deduced from the returns obtained from more distant rain-gauges, care being always taken that the least of the gauges have been observed for a sufficient number of years to enable the true average rainfall to be determined.

To store the whole of the water flowing from a gathering ground during a cycle of wet years in order to utilise it during a cycle of dry years would entail the construction of a reservoir of enormous capacity, at a cost incommensurate with the benefit to be attained; it is therefore customary to make them of a size as to enable the supply to be maintained without failure throughout the three driest consecutive years, the annual rainfall of which years generally amounts to one-fifth of the average taken over a long period—say, fifty years. From the mean rainfall of the three driest consecutive years a deduction must be made for loss by evaporation, which is usually between 12 and 16 inches. The

known as the available rainfall, and represents the quantity of water which can be drawn continuously from an impounding reservoir without fear of failure in the driest years. The whole of this water can rarely be abstracted from a gathering ground without injuriously affecting mill-owners or other owners on the stream below the reservoir; therefore the water to be compensated for the injury they sustain. This is usually done by payments in money, but where the mills are numerous it is generally more economical to

make compensation in water delivered into the stream immediately below the reservoir, because the same water compensates each mill in succession as it flows down the stream.

It has now become an accepted principle that one-third of the available rainfall flowing down a stream in a regulated quantity day by day throughout the year is of greater benefit to the mill-owners (with few exceptions) than the whole of the rainfall allowed to flow in the irregular manner in which it is provided by nature. This compensation water is discharged from the reservoir into the stream either during certain hours on working days or by a uniform flow throughout the twenty-four hours of every day; a method now frequently demanded by county councils on so-called sanitary grounds, but which is in my opinion not infrequently detrimental to the interests of mill-owners without a corresponding advantage to the public.

Where compensation in water is given there remains for distribution in the district to be supplied a quantity equal to only two-thirds of the available rainfall.

Assume for the sake of illustration a case in which the gross annual rainfall is 40 inches. Then we have:—

	Inches.
Gross annual rainfall	40
Deduct to arrive at the mean annual rainfall of the three driest consecutive years—say, one-fifth of forty	8
Mean annual rainfall of three driest consecutive years	32
Deduct for evaporation, say	14
Available for supply if no compensation water be given	18
Or if compensation water be given deduct one-third	6
Leaving available for supply	12

Having now ascertained the amount of the rainfall available for the supply of the district, it remains to be seen whether or not the area of the gathering ground above the reservoir is sufficient to give the required quantity of water. If it is not, the area may in some cases be extended by means of catchwaters in the form of open conduits cut along the sides of the valley below the embankment of the reservoir and at such an elevation as will enable them to discharge the waters they collect into the reservoir above its top-water line.

Almost all waters derived from gathering grounds are much improved by filtration before use for potable purposes. In some cities and towns in this country, more especially in Lancashire and Yorkshire, the benefit derived from filtration has not been sufficiently appreciated, and the water is still delivered into the houses unfiltered; but I am of opinion that the time will come when nearly every town of importance supplied with water derived from gathering grounds will adopt filtration, for it not only removes matters in suspension but it also diminishes the discoloration due to peat which is to be found in most moorland waters.

Reservoir dams in Great Britain consist either of earthen embankments or masonry walls. Of the former, examples of considerable size may be seen at the reservoirs of the Manchester Waterworks, designed by Mr. J. F. Bateman, F.R.S., past president Inst.C.E., who was president of Section G of the British Association at the Manchester meeting in 1861; and at the Rivington reservoirs of the Liverpool Waterworks, designed by my father, the late Mr. Thomas Hawksley, F.R.S., past president Inst.C.E., who was president of this section at the meeting at Nottingham in 1866.

Earthen embankments are formed of the most suitable materials to be obtained by excavation in their neighbourhood; the water is retained by a wall of watertight clay puddle forming the core of the embankment, extending for its whole length and continued at each end into the natural ground forming the hillsides. This puddle core has to be carried down into the ground until watertight strata be met with, occasionally necessitating a puddle trench having a depth of 80 feet or more below the bottom of the valley and 200 feet or more in depth in the hillsides. Where the strata forming the sides of the valley are not watertight it is necessary to continue the puddle core along the sides of the reservoir by means of wing trenches. The determination of the depth and extent of the puddle trench in order to secure the watertightness of the reservoir is one of the most difficult and anxious duties of the engineer on whom rests the responsibility of its construction. In forming his judgment he has to rely entirely on his experience for guidance, this being one of those matters which cannot be learnt at an engineering school or even in an engineer's office. How much depends on the exercise of a wise and trained judgment may be understood when it is realised that an error in this respect may result in very costly works having to be subsequently undertaken to stop an escape of water which might in the first instance have been prevented by a comparatively small outlay.

Provision has to be made for the passage of flood-waters during the construction of the embankment. This is ordinarily effected by the construction at about the level of the stream of a tunnel of sufficient diameter to convey with only a slight head the volume of water produced by the greatest flood which

* In the presidential address to the Engineering Section of the Association, by Mr. Charles Hawksley.

experience has taught us to anticipate. This tunnel is sometimes formed beneath the embankment, but preferably, where the circumstances are favourable, it is carried through the natural ground near to one end of the embankment. A shaft is built in connection with the tunnel, in which, after the embankment has reached its full height, are placed the outlet valves of the reservoir.

It is of the utmost importance that ample provision should be made for carrying off the flood and other surplus waters coming from the gathering ground when the reservoir is full, for if this be not done serious consequences may ensue, including the washing away of the embankment with resulting destruction of property and even of life. The surplus waters sometimes fall down a shaft erected within the reservoir, and make their escape by means of the tunnel previously mentioned, but more frequently they flow over a masonry weir and reach the stream below the embankment by means of a bye-wash formed in the hillside. In my opinion the latter method is in most cases to be preferred, as being free from the risk of blockage by ice to which the shaft and tunnel are liable. Engineers are occasionally reproached with extravagance in the magnitude of the provision made for the escape of flood waters, but it must always be borne in mind that a maximum flood has to be provided for, such a flood as may occur only once in twenty or thirty years, but which must find a means of escape when it does occur, without danger to life or property.

Masonry dams are not so frequent in this country as earthen dams, partly by reason of their greater cost and partly because the geological conditions are generally not favourable to their formation, for not only do they require a supply of suitable stone near to hand for their construction, but they also need an incompressible foundation, such as rock or very strong shale. Any irregularity in the compression of the foundation occasioned by the weight of the dam would be liable to fracture the masonry of which it was built.

In the case of masonry dams a tunnel for the passage of flood waters during construction is formed at a suitable level in the masonry of the dam, and after completion of the work they are generally allowed to pass over the top of the dam for the whole or a portion of its length, thus obviating the necessity for and the cost of an independent bye-wash.

Whilst masonry dams have the advantage over earthen dams of not being liable to be breached by a waterspout, I am not aware of any case in which an earthen dam has been destroyed in that manner, and so far as I am able to form an opinion the accidents due to other causes have been as frequent in the case of masonry dams as in that of earthen dams. The destruction of masonry dams has in some instances been the result of too great reliance having been placed on theoretical calculations, without sufficient allowance having been made for the many defects in material and workmanship which might occur in a work of that kind. It was the opinion of the late Mr. Thomas Hawksley that in some cases the destruction of masonry dams had been occasioned by the neglect of the effects of uplift due to the pressure exerted by water finding its way beneath the bottom of the dam, a possible condition which he was very careful to take into account when designing the masonry dam of the Vyrnwy reservoir of the Liverpool waterworks.

Examples of large masonry dams in the United Kingdom may be seen in that constructed by Mr. G. H. Hill at Thirlmere Lake, from which the city of Manchester is partly supplied with water. Also at the Vyrnwy reservoir of the Liverpool Corporation Waterworks, designed by and partially carried out under the direction of the late Mr. Thomas Hawksley, after whose retirement it was completed by Mr. G. F. Deacon, who presided over Section G on the occasion of the visit of the British Association to Toronto in 1897, and again at the reservoirs near Rhayader, in Wales, now approaching completion, from the designs and under the direction of Mr. James Mansergh, F.R.S., past president Inst.C.E., for the supply of water to the city of Birmingham.

From the impounding reservoir the water has to be conveyed to the point of distribution by an aqueduct. This aqueduct, which is sometimes of great length, may consist either wholly of metal pipes, usually of cast-iron, or partly of a conduit constructed of masonry, brickwork or concrete following the contour of the ground, with occasional tunnels where high ground has to be passed through, and metal (inverted syphon) pipes where valleys have to be crossed. These conduits may be either open or covered, the latter method being generally adopted, when they become what is technically known as "cut and cover" conduits. In the case of a continuous pipe-line of considerable length it is divided into sections by means of break-pressure tanks interposed at suitable elevations, each tank being, say, 100 feet or thereabouts below the preceding tank, by which means the pipes are relieved from the excessive pressure to which they would be subjected if the head due to the elevation of the impounding reservoir was carried forward to the service reservoir, from which the water is distributed to the consumer. Steel pipes

are frequently used abroad where the cost of carriage but they have not yet been much employed in this country, sufficient experience not having yet been gained in reference to the deterioration of steel pipes due to the action of the water from within and of the ground in which they are laid from without.

The lines of pipe are provided at intervals with stopcocks, sluice-valves and air-valves, and also in some cases with self-acting valves which close automatically in the event of the velocity of the water in the pipe becoming abnormally increased owing to the bursting of a pipe beyond.

I have already stated that most waters obtained from gathering grounds are much improved by filtration. The process of filtration may be carried on where the water flows into an impounding reservoir or at any convenient point on the line of the conduit thence to the place of distribution, provided the filter beds are situated at such an elevation as to place them in line of hydraulic gradient. Various considerations influence the determination of their position, but it is generally found that the water should not be subjected to long exposure to light after filtration. Filtration by the slow passage of water through a bed of sand from 2 feet to 3 feet in thickness, supported by small gravel or other suitable material, is the method usually adopted in Europe, though what is known as mechanical filtration has been used to a considerable extent in the United States, and may under certain conditions be employed. However I do not think it is likely to be placed to any considerable extent in this country of the system of sand-filtration introduced so long ago as 1828 by the late Mr. James Simpson, past-president of the Institution of Civil Engineers. The rate of filtration, though thoroughly effective must depend on the condition of the water to be filtered, but a rate of from 450 to 550 gallons per square yard of surface of sand per day (*i.e.* twenty-four hours) is usually found to be efficient. Filter-beds are generally situated above the sky, but occasionally, when situated at considerable elevations, they are covered by roofs to prevent interruption of the process of filtration by the formation of ice in times of severe frost. In certain exceptional cases in which the water is difficult to treat it is twice filtered, with excellent results. The water after filtration is discharged into a pure-water tank or service reservoir of sufficient capacity to enable the process of filtration to be carried on at a uniform rate by night as well as by day without giving rise to irregularities in the rate of demand in the district of supply.

The particles in suspension in the water, which are intercepted by the process of filtration, gradually form a film on the surface of the sand and thus improves the filtration. This film at last becomes so thick as to unduly reduce the rate at which the water passes through the sand. The film is then laid off, and the water having been withdrawn from the filter, the sand is scraped off to a depth of about a quarter of an inch, the sand thus removed is washed in suitable machinery from the matter intercepted during the process of filtration, and is afterwards replaced in the filter-bed either immediately or after several similar scrapings have taken place, care being taken that the thickness of the sand left in the bed at any time be reduced below that required to insure efficient filtration. From time to time the sand is removed to a depth of several inches and washed, and occasionally it is replaced by fresh sand washed to its full depth. From the foregoing it will be understood that the filtration of water, as a simple process, is one which necessitates constant watch and care on the part of those responsible for the management of the waterworks undertakings in which the water is filtered.

As near to the termination of the aqueduct conveying the water from the impounding reservoir to the point of distribution as the levels of the ground will permit, a service reservoir should be constructed for the purpose of equalising the flow of water along the aqueduct, and for maintaining the pressure in the district during any temporary interruption on the aqueduct due to a burst pipe or otherwise. The service reservoir should contain not less than one day's supply of water, three days, and in exceptional cases, even more being sometimes desirable. Service reservoirs should by preference be covered so as to exclude light, and thus prevent the growth of vegetation which would otherwise take place. They are often when consisting of brick arches, has also the advantage of keeping the water cool in summer, and preventing the water from becoming too much reduced in winter. The draught on the service reservoir is continually varying throughout the day and night according to the hourly requirements of the population which it serves. This variation is considerable, amounting during certain hours of the day to at least twice the average rate of consumption during the twenty-four hours. It will therefore be apparent that were the service reservoir the equalising effect of the service reservoir the aqueduct to have a capacity at least double that which is needed for the service reservoir is available. At Southport, for example, the service reservoir is situated at a distance of about seven miles

because, owing to the great extent of comparatively flat the neighbourhood of Southport, it was impossible to a suitable elevation nearer to the town than Gorse Hill, summit of which the reservoir stands. Consequently in pipes thence to the town have to be of sufficient to convey the water at a rate corresponding with the at the time of maximum consumption, or in other of about twice the capacity which would have been if the service reservoir could have been placed close to n, when these pipes would, for the greater part of their have been situate on the inlet instead of on the outlet the reservoir.

ing now followed the water in the case of a gravitation from its source to the service reservoir from which it is distributed to the consumers, it will be convenient to a similar manner water obtained by means of pumping, until later the consideration of its distribution, which, leaves the service reservoir, is common to both gravita- pumped water.

ing supplies may be divided into two sections; first, here the water is drawn from a source only slightly he level of the pumping engines, such as where the taken from a stream or lake, or from culverts formed l beds, or is discharged from impounding reservoirs t too low a level to enable the water to gravitate to the distribution; and secondly, where the water is raised p wells sunk in the sandstone, chalk, or other water- strata.

he first-mentioned cases the water has usually to be when it is generally found convenient to place the is at the pumping-station, the water being firstly lifted it will gravitate) on to the filter beds; and secondly, ration, and by means of a separate pump, forced pipes up to the service reservoir whence it is to be ed.

e case of deep wells the water seldom, if ever, requires and is usually raised either directly or through pipes service reservoir, the total lift being frequently divided lift pumps and force pumps with the object of y the work to be done by the engine.

times the well alone will yield a sufficient supply of it often it has to be aided by boreholes or by drifts or driven horizontally in the water-bearing strata near of the bottom of the well, and occasionally continued siderable distance, even as much as a mile or more t well, the length of the headings depending on the of water which can be profitably obtained from d also on other considerations too various to be id here. There are cases in which it is possible to efficient water by boring from the surface of the ground ring a pump down the borehole. The expense of a ll is thus saved, but it is, of course, impossible to the supply by drifting.

me at my disposal will not admit of any observations nerits of the various kinds of engines and pumps in raising water; they are not only very numerous, has to be considered in relation to its suitability for ular circumstances of the case in question. Suffice it t although most of the water pumped in the United is raised by means of steam engines, water turbines, es, oil engines, and (to some slight extent) electric e also employed. It may be mentioned that one of t oil engines in this country is engaged in pumping a deep well, and it is not improbable that gas and is will in the future become more largely employed orks purposes.

ld here be mentioned that there are a few instances ntry, and many in the United States of America, in vice reservoir is dispensed with, and water is pumped to the main and distributing pipes of the district to e a method which, although employed with success, n, in my opinion, be adopted where the circumstances he use of a service reservoir. Where direct pumping ovision must be made to insure continuous pumping ght without intermission, so as to avoid interruption ly of the district, and the speed of the engines must ly varied to meet the demands of the consumers for nt. The maintenance of uniformity of pressure in pipes may be assisted by the employment of large air y accumulators such as are used for the supply of pressure, or preferably by a combination of air al accumulators.

l now return to the service reservoir. When this situate between the source of supply and the district plied, it receives the whole of the water and into the district as needed for use; but when the s between the source and the service reservoir, the excess of supply over consumption, and on and makes good any deficiency during those hours consumption exceeds the supply. In either case oir has the effect of equalising the flow from the

source to the reservoir throughout the twenty-four hours of the day.

From the service reservoir the water is conveyed by one or more main pipes into the district of supply. These pipes are gradually reduced in diameter as they pass through the district; the water which they convey is taken off by other main pipes branching from them, and finally enters the service pipes, which are usually from 5 inches to 3 inches diameter, and are those from which the consumers' communication pipes are taken. The service pipes should in all cases be controlled by valves, so that the water can be shut off from them without interfering with the flow through the main pipes. Consumers' communication pipes are not generally allowed to be attached to pipes of greater diameter than 5 inches, and where a pipe of 6 inches diameter and upwards is carried along a street, another pipe of 3 or 4 inches diameter (preferably the latter size), and called a ryder pipe, is laid alongside to receive the attachments of the communication pipes. The ryder pipe is divided into lengths of from 350 to 400 yards, each of which is controlled by a valve at its junction with the main pipe. Hydrants for use in case of fire are attached to the ryder and other service pipes throughout the district at a distance apart not exceeding 100 yards. Except in streets where the houses are small and not high, it is desirable to lay the service pipes of not less than 4 inches diameter, not because a smaller pipe would not suffice to meet the requirements of the domestic consumers, but in order to insure an ample supply of water in case of fire. When determining the sizes of the main pipes to be laid throughout a town, the engineer commences with the pipes most remote from the service reservoir, and gradually increases the diameter according to the probable number and magnitude of the supplies to be taken from them.

Pipes of cast-iron having sockets run with lead and set up with a hammer are mostly used for waterworks purposes, but in some instances turned and bored joints put together without lead have been used with success, but these are only suitable where there is an unyielding foundation. I remember a case in Yorkshire where turned and bored pipes were, much against the advice of the engineer, used for the distribution of gas in a colliery district, with the result that in a few years nearly every joint was leaking. Fortunately the engineer had anticipated that result, and had laid the pipes with sockets in addition to the turned and bored joints; consequently, by opening the ground at each joint and running the joint with lead, the leakage was stopped without necessitating the relaying of the system of pipes. The main pipe of 44 inches diameter, conveying water from Rivington to Liverpool, passes for several miles over a coalfield, and the ground has in places subsided over the coal workings as much as 4 feet without interfering with the supply of water; the ground having been opened at the pipe joints, the lead, which had been partially drawn from the joints, was forced back by hammering, and the joint was again made sound.

In some countries, where the cold is intense, water pipes have to be laid at a depth of from 10 feet to 12 feet below the surface of the ground to protect the water from frost, but in the United Kingdom a depth of 2 feet 6 inches to 3 feet has been found to be sufficient even in very severe frosts.

Water, especially when soft, causes the interior of cast-iron pipes to become incrustated with nodules of iron, which reduce the effective diameter of the pipe and so diminish its capacity. This action is greatly retarded and in some instances entirely prevented by the application to the pipes, soon after they have been cast, of the coating introduced many years ago by the late Dr. Angus Smith, a process now nearly always employed.

It was at Southport that I witnessed the bursting of a main pipe, the only occurrence of the kind that I have seen during a period of forty years, of which a considerable portion has been spent amongst waterworks. Owing to the introduction of a new supply of water the original main pipe was charged with water at a higher pressure than it had been intended to bear, with the result that several fractures occurred. I happened to be standing on one of the roads at a little distance from the town when I heard a sound, and looking in the direction whence it came, saw in a field near by a black column rise vertically in the air for about 40 feet in height. A girl who happened to be working in the field put her hands to her ears and fled, probably thinking she had seen Satan himself, but the column soon became clear, the black colour having been caused by the peat carried up with the water.

Having traced the water from its source to the door of the consumer, we now enter into another branch of the subject. Up to this point the water has been entirely under the control of the company or local authority by whom it is provided, but from the moment it enters the consumers' communication pipe, or where the communication pipe is the property of the water supplier, from the moment the water reaches the premises of the consumer, it comes under his control, subject only to such regulations and supervision as the Legislature has given the water supplier power to make and to exercise.

re of their remains and their tombs, appeared to belong to the dynasty of ten kings which preceded Menes, the first of all Egypt. Of the first dynasty all the eight kings had identified; their tombs, vases, sealings and officials were now familiar, and the gradual changes between one reign and another could be traced as clearly as we could during the century or two. The growth of the use of writing could be seen on the seals, the impressions of over two hundred which had been collected—at first only a single sign for a name of a king; then a more complex name; then the name named with the king; next the titles of various offices; and in the end of the second dynasty, full names in a style as complete as in any later age. The people of the dynastic period were entirely different from any prehistoric age, though it united with it and overlaid some features of it. Broadly, the predynastic people were mechanical and the dynastic race was artistic, and in the earliest works of the kings there was an ability of a new style, though still archaic. By the end of the reign of Narmer and under his successor, the artistic types had become fixed, and they remained the patterns to which the Egyptians recur at each successive renewal of art during the years. The most completed stage was in the middle of the third dynasty, and at its close there was certain degradation. The state of art between the first and the fourth dynasties is not yet clear; it seemed to have become conventional and slowly devitalised, until it made a fresh start with the great revival of activity under the pyramid builders. The royal tombs of the early kings were enlarged forms of the prehistoric pit. A pit in the ground had, during the prehistoric age, been improved on by making it a large chamber, lined with mud, roofed with timber and brushwood, and furnished with a number of vases and other objects. The earliest royal tombs were much the same, only lined and floored with stone, the offerings being dropped in between the timber and the side of the pit. Then regular cells were built for the offerings; next a row of small chambers apart from the tomb, and, lastly, an elaborate series of store-chambers of various sizes. The tomb originally had an entrance, then a sloping passage to it, next a stairway, and lastly, a long, sloping passage to the pyramids. The outer form was at first a slightly raised heap over the roof of the tomb. This was next walled to retain the earth; after that the walling was raised, and a block of brickwork with sloping sides on the outside, the brick mastaba. This later became expanded by adding around it, and extension upward, so as to be a mass of brick coats, and when translated into stone at the end of the third dynasty it suggested a pyramidal outline, and so led to the pyramid type. Dr. Petrie concluded his lecture by saying that now for the first time could be seen what was going on in each generation over a period of nine or ten centuries. A few dark times still needed the filling-in of, but the general course of man's development and could now be understood with a completeness which had been a solid basis for some general views. Archaeology and the scientific knowledge of the past of man, gave us a new basis for comparisons for estimating his future.

The subject of the second lecture was "The Temples of Egypt." He said that after Mariette had worked on the ruins of the Osiris temple at Abydos, he declared that the temple remained of the old temple, that even the foundations were destroyed to the roots, and that any further research was impossible. From that very ground the work of the past century had produced foundations of ten successive periods of time, one below another, occupying nearly 20 feet in the soil. The examination and recording of these buildings required over 4,000 measurements and 1,000 levellings. The first temple was of Amasis (twenty-sixth dynasty), then Amenhotep III. (twentieth dynasty), then Amenhotep III., then Amenhotep I. (eighteenth dynasty), then Amenhotep III. and Useratesen I. (thirteenth and twelfth dynasties), then Sankhkara (eleventh dynasty), then Mentuhotep I. (eleventh dynasty), then Pepy (sixth dynasty), then the temple of the fourth dynasty, below that the temple of the third dynasty and at the base of all the oldest temple, of the first dynasty. Thus the site was continually reused during 4,000 years; these periods of building followed entirely different plans, and the successive plans had scarcely any relation one to another.

The principal results were in the first dynasty. The fine ivory carving at that time showed work equal to that which succeeded it in later history. The appreciation of the delicacy of the muscular curves and the power of the arm were as good as in the best Classical or Renaissance art. The art of glazing was applied to large wall-tiles, covering brick walls, and to vases, as shown by part of a vase with the name of Menes. The use of two colors, a purple inlay in green, appeared in the name of Menes. Hence glazing was as advanced at the beginning of the third dynasty, about 4700 B.C., as it was for 3,000 years later, when polychromatic glazes of the eighteenth dynasty. The relations of Egypt were further illustrated by finding

the same black pottery in the first dynasty that was now known in Crete as late Neolithic. The camel was shown in the first dynasty by a well-modelled head; hitherto it was not proved to have been in Egypt till about 4,000 years later. In the well-known age of the fourth dynasty we had for the first time the portrait of the best known of all the kings—Cheops, or Khufu—whose appearance, however, was till then quite unknown. A minutely carved ivory figure, the face of which was only a third of an inch high, showed his character in an astonishing manner. The energy, decision and driving power was perhaps stronger than in any other portrait that was known. The tradition of his closing the temples and forbidding sacrifices was fully confirmed by finding that no large temples existed in the fourth dynasty such as those of the earlier or later times. Only a bed of vegetable ashes was found in a cell, and throughout it hundreds of clay *figulina* as substitutes for sacrifices, not a single bone of an animal occurring in the whole mass. The worship in the temples of Abydos was originally that of the jackal god Up-ua-tu, "the opener of ways," who showed the paths in the desert for the souls to go to the West. Osiris did not appear in any temple inscription for 2,000 years, and was not prominent till yet later. Some large decrees of the fifth and sixth dynasties had been found, and the oldest piece of certainly-dated iron, apparently a wedge, of the sixth dynasty, about 3,400 B.C. This site had fully shown how important it was to dissect minutely a temple site in which only earth remained, and where at first the absence of stone walls might lead to the idea that nothing was left there. The art of the beginning of the Egyptian monarchy lay hidden in that ground.

Mr. Arthur Evans spoke about the similarity between the pottery he had recently excavated at Knossos, in Crete, and that described by Dr. Petrie as belonging to the period of the first dynasty in Egypt, and on the great importance chronologically of the results obtained by Dr. Petrie's wonderfully interesting discoveries, which went back to the fifth millennium before the Christian era. In respect of the widespread custom of using seal impressions they helped one to an understanding of the impulse which brought about a similar state of things in Crete.

Dr. Forbes, referring to the illustration given by Dr. Petrie of an animal which he called a bear, asked what evidence there was of the bear being found so far south at the period denoted by the first dynasty in Egypt.

Dr. Petrie replied that the illustration was clearly a bear, and that during that period in Egypt there were lions, giraffes, elephants and other animals that had been driven out at later periods. The bear was then and much later found in the adjoining country of Syria, only a little further north of Egypt.

Professor Conway asked how Dr. Petrie equated the reign of the dynastic kings with exact periods of years so as to get the chronological date of the different dynasties.

Professor Petrie replied from the tablets and writings of the Egyptians of even the earliest dynasties, so exactly were their records kept. Even in respect of the high-water periods of the Nile this exactness was to be found, continuing down to later times, so that there was no reason for thinking that the historians of the later dynasties were incorrect in their statements of the various lengths of the reigns of the earliest dynastic kings.

A hearty vote of thanks to Dr. Petrie was carried with applause.

PLANT-EVOLUTION AND GOTHIC PERIODS.

IN concluding his address to the Section of Botany at the meeting of the British Association, Mr. A. S. Seward, F.R.S., lecturer on botany in the University of Cambridge, said:—

There is no more fascinating task than to follow the onward march of the plant-world from one stage to another and to watch the fortunes of the advancing army. We see from time to time war-worn veterans dropping from the ranks and note the constant addition of recruits, some of whom march but a short distance and fall by the way, while others, better equipped, rise to a position of importance. At long intervals the formation is altered and the constitution of the advancing and increasing host is suddenly changed; familiar leaders are superseded by new-comers who mark their advent by drastic reorganisation. To change the metaphor, we may compare the stages of plant-evolution to the records of changing architectural styles represented in Gothic buildings. The simple Norman arch and massive pier are replaced, with apparent suddenness, by the Pointed arch and detached shafts of the thirteenth century; the latter style, which marked an architectural phase characterised by local variations subordinated to a uniformity in essential features, was replaced by one in which simplicity was superseded by elaboration, and new elements were added leading to greater complexity and a modification of plan. Similarly, the Palæozoic facies of vegetation passes with almost startling suddenness into that which monopolised

the world in the Mesozoic era, and was in turn superseded by the more highly elaborated and less homogeneous vegetation of the Cretaceous and Tertiary periods. In taking a superficial view of architectural styles we are apt to lose sight of the signs of gradual transition by which one period passes into the next; so, too, in our retrospect of the changing scenes which mark the progress of plant-evolution, we easily overlook the introduction of new types and the gradual substitution of new for old. The invention of a new principle in the construction of buildings is soon followed by its wide adoption; new conceptions become stereotyped, and in a comparatively few years the whole style is altered. As a new and successful type of plant-architecture is produced it rapidly comes into prominence and acts as the most potent factor in changing the facies of a flora. Making due allowances for the imperfection of the geological record, we cannot escape from the conclusion, which is by no means opposed to our ideas of the operation of the laws governing evolutionary forces, that the state of equilibrium in the vegetable kingdom was rudely shaken during two revolutionary periods. The earlier Transitional period occurred when Conifers and Cycads became firmly established, while for the second revolution the introduction of the Angiospermous type was mainly responsible. As in the half-effaced documents accessible to the student of architecture "the pedigrees of English Gothic can still be recovered," so also we are able to trace in the registers imprinted on the rocks the genealogies of existing botanical types.

KING'S COLLEGE, LONDON.

THE Division of Architecture, which was separately constituted a year ago, will resume work on October 1, when the various courses of lectures and the studio for day students will be opened. A feature of the past session has been a visit paid by the students for measuring and sketching to Oxford, and it is intended to arrange a similar week's visit to some centre of architectural interest during the Easter vacation of the new session.

The evening lectures and the studio for evening students supported by the Carpenters' Company will open on Monday, September 28, when there will be a short opening lecture by the Professor, and new students can be enrolled. The evening fees have been somewhat reduced in most of the evening classes, and the Carpenters' Company are prepared to grant nominations to deserving students as in previous years.

COLDRUM AND STONEHENGE.

AT the meeting of the British Association Mr. George Clinch, F.G.S., stated that the district which lies immediately to the north-west of Maidstone is remarkable for an interesting series of prehistoric megalithic remains. The best known of these is Kits Coty House; a fallen cromlech called the "Countless Stones," lower down the same hillside; several other ruined examples in Addington Park, and Coldrum, or Coldreham, which stands less than two miles north of this on high ground overlooking the Medway valley, and within sight of Kits Coty House.

The remains of Coldrum comprise a central cromlech without capstone, an irregular line of large blocks of stone on the western side and traces of a tumulus. The published descriptions of it do not, however, mention its most important and characteristic feature, namely, that between the two upright stones which form the sides of the chamber there stand two stones, about midway, forming a partition which divides the space into two adjoining sepulchral chambers. The size of the upright stones is remarkable (7 feet high by 11 feet by 2 feet 3 inches thick), and still more the regularity of their form. Seventeen irregularly placed stones, enclosing a small space on the west side of the cromlech, represent a part only of what was probably a quadrangular or oblong enclosure, placed at the foot of the tumulus, by which the whole cromlech was originally concealed.

The arrangements above described—of a two-chambered cromlech with a square or oblong tumulus and massive outline wall—are of great rarity, and the whole structure suggests a late date in the Neolithic Age, when the form of the sepulchral chambers was followed out in the construction of the mound. A similar somewhat larger neolithic megalithic structure at Sievern, in Hanover, has been fully published, with illustrations, by Fr. Tewes. The regular form, good proportions and flat surfaces of the upright stones at Coldrum are very remarkable, and suggest artificial shaping and perhaps dressing. These also point to a late period in the neolithic age, and present remarkable similarities to the forms at Stonehenge. That these careful forms and surfaces could be produced with stone tools has been shown in the case of Stonehenge by Professor Gowland, "Recent Excavations at Stonehenge. The idea of

enclosing the principal structure within a line of stones is common to Stonehenge and Coldrum; but whereas the latter was obviously a sepulchral monument, Stonehenge, following to some extent the same arrangement, was constructed on a more ambitious scale, and probably designed for a different purpose.

The megalithic structures of Kent furnish a valuable illustration of the constructive skill of neolithic man. At Kits Coty House the two main uprights lean somewhat inward against the middle upright between them, thus distributing the weight of the capstone so as to consolidate the structure, the resistance of which to complete destruction proves also the excellence of its foundations. At Coldrum construction has developed further, for the uprights still erect, even though no capstone remains. The authorities on these rectangular megalithic monuments the prototypes of a series of Anglo-Saxon churches, sometimes called "Celtic" or "British," of which good examples are to be seen at Boarhurst, Hants, and in Dover Castle.

GENERAL.

An Exhibition of works by Thomas Bewick, the engraver, was opened on Saturday at Newcastle. The whole of the blocks for the "British Birds" and "Quadrupeds" have been lent, and first copies of the engravings. The engraver's methods of work are also illustrated in various stages, and many of his engravings are exhibited.

The Italian Government have undertaken excavations at the site of the Campus Martius, and have discovered the foundations of the monument erected by the Senate 13 B.C. under the consulship of Nero and Quintus, in honour of the Emperor Augustus.

The Glasgow University Court decided last week to continue to carry out the extensions on the original plan, which provide two separate buildings, one on the north and the other on the north of the main avenue. An estimate of the expenditure will be about 100,000*l.*

A "Sun Chariot" has been found in a moor of the island of Denmark. From the site where it was found it is estimated to be not less than 3,000 years old. It is now in the collection at Copenhagen. The subject is of great interest for the Scandinavian and Germanic race.

New Buildings are about to be erected in Midland by Mr. J. Falkingbridge Parker, the architect, at the estate.

A Memorial to James Watt is to be set up on the site of his birthplace at Greenock. The form the memorial will assume was not determined last week by the committee. Appeals for contributions are to be made to users of steam throughout the civilised world.

Forty Panels, which are exquisite examples of carving, have been discovered in the Garde-Meuble at Versailles. In style they are of the period of Louis XIV, and belonged to the palace at Versailles, from whence they were removed in the middle of the last century.

The Italian Police have made several arrests in connection with the theft in January of a bas-relief from the Lucca della Robbia in the church of S. Severo at Calenzano. The relief has been broken, but will be repaired.

Copies of the *Venus* and the *Mercury* by the sculptor Pigalle are to be prepared for the Kaiser's collection at the Museum, Berlin.

The Chief Rabbi dedicated on Saturday the new Newington Synagogue and Class-rooms in Shackleton Road, N.E. The new synagogue gives seating accommodation for 450 men and 300 women, while in the classroom room for 250 children. The total cost, including the cost of the building, is about 12,000*l.* There is a handsome pulpit with a canopy of Carrara marble. Mr. Lewis Solomon is the organist.

A Society of Painters, Sculptors and Architects has been formed in Paris, under the presidency of M. Frantz, with the idea of holding an exhibition at the end of the year and hereafter annually.

A Committee has been formed in Dublin to consider the question of the housing of the working classes in the city and it has been asked to report upon the following subjects:—The number of working people in the city and the number of proper dwellings. The probable total cost of providing necessary dwellings. The districts and areas in the city which need housing schemes. The manner in which the question of housing the labouring population has been dealt with in Great Britain and in foreign countries, and the measures necessary to improve the existing law relating to the subject, and to consider any other means of dealing with the question.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

spondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

s great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

HTON.—Nov. 9.—Designs are invited for a new school. Premiums of 50l., 30l. and 20l. will be paid to the second and third premiated designs respectively. Paid up to Sept. 29 on receipt of 1 guinea, which will be paid on receipt of design. Mr. Leonard Holmes, hon. Secy, Brighton and Hove Hospital for Women, 76 West Brighton.

LIN.—Sept. 30.—Designs and specifications wanted for men's cottages, semi-detached or terraces, each cottage to exceed £100. The successful plan to become the property of the company on payment of £20. Mr. Francis B. O'Connell, Great Southern and Western Railway, Kingsbridge Road, Dublin.

AM.—Oct. 7.—For sewage disposal of the village of Ashford. Report, plan and estimate of probable cost not to exceed 30 guineas. Further particulars, Mr. R. Lonergan, Ashford Place, Folkestone.

AND.—Sept. 26.—Plans are invited for the laying-out and development for municipal and other purposes of about 100 square yards of land in Church Road and Sandy Lane,

Leyland, Lancs. A premium of 15l. 15s. is offered to the author of the plan considered to be the best design. Mr. M. H. Wilkinson, surveyor, 21 Towngate, Leyland.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75l. for design placed first, and one of 25l. for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100l., 50l. and 30l. respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 22.—Competitive plans are invited for the erection of a hospital and offices. Conditions of the competition and full particulars may be obtained from Mr. J. E. Shaw, clerk to the Lunacy Board, County Buildings, Ayr.

TRADE NOTES.

THE Royal apartments used by His Majesty the King last week at Doncaster Racecourse have been furnished with an electric passenger lift by Messrs. Archibald Smith & Stevens. The machine is a duplicate of that erected for the King's personal use at Epsom by the same firm, and was during the King's visit under the care of Mr. Major, on behalf of the makers and of the Doncaster race committee.

THE Columbian Fireproofing Company, Ltd., 37 King William Street, E.C., have obtained the contracts for fire-proof floors, and have commenced the work at the Hospital for Consumption, Liverpool, for which the architects are Messrs. Grayson & Ould, of Liverpool; and the new mission hall, Bethnal Green, for which the architect is Mr. S. Clifford Tee, 50 Moorgate Street, E.C.

A LARGE clock has just been erected in the parish church tower at Cornholme, Lancashire, which shows time on one large dial, and strikes the hours. It has been made by Messrs. John Smith & Sons, Midland Clock Works, Derby, to the designs of Lord Grimthorpe. The same firm have just received an order to make a large chiming-clock with four dials from the Nelson Corporation, in the same neighbourhood.

MESSRS. WILLIAM POTTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, have received instructions from Mr. James C. Winn, J.P., The Grange, Aysgarth, Wensleydale, Yorks, to erect a new clock from Lord Grimthorpe's designs at the parish church, Aysgarth. The clock will chime the Great St. Mary's of Cambridge quarters, strike the hours on the large bell, and show the time upon two external dials.

ELECTRIC NOTES.

THE Bo'ness Town Council have arranged for the acquisition of ground at the east end of Main Street as a site for the generating station in connection with the lighting of the burgh by electricity. The site is at present occupied by some old house property, but accommodation is to be found for the tenants elsewhere. The purchase price was 1,245/, and the National Electric Wiring Company, the contractors for the scheme, have agreed to pay sinking fund, and interest at the rate of 6 per cent., on 1,000/. The rest is to be debited to street improvement, the Town Council having resolved to widen the thoroughfare by throwing some 20 feet at the widest part into the street.

THE mayor (Councillor W. G. Thomas) presided over a special meeting on Tuesday of the Carnarvon Town Council, convened for the purpose of pushing forward the proposed electric-lighting scheme for the borough. The Council has entered into a provisional agreement with the National Electric Wiring Company for an electric installation at Carnarvon, the Corporation providing capital to the extent of 17,000/, and the company undertaking to construct the works and to maintain them for a period of years, repaying the Corporation annual instalments of principal and interest on the loan, together with all profits over and above a specified amount. Since the Corporation made this provisional agreement the North Wales Power and Traction Company, Ltd, had made an offer. The inquiry by the Local Government Board has been fixed for Tuesday next.

THE extended electric-lighting scheme for Dublin has been practically completed and arrangements have now been made for the shutting-down of the Fleet Street generating station and the transference of the load to the Pigeon House Fort at midnight to-morrow (Saturday). The entire twenty sub-stations have been fully constructed and equipped, and the pressure tests to which the extra high-tension mains have had to be subjected have been carried out to the satisfaction of the consulting engineer. Private consumers in the new districts can have a supply direct from the Pigeon House station of the electrical energy for lighting and power purposes throughout the twenty-four hours. Some time back the experiment was made of temporarily shutting-down the Fleet Street plant and having the load taken over by the new plant at the Pigeon House. The result of this experiment was so satisfactory that arrangements for the permanent transference of the

generating centre to the Pigeon House Fort were immediately made; and the remaining portion of the Fleet Street plant will be now removed by the contractors who have purchased it. The space available after its withdrawal will be mainly used for storage purposes. Up to the present about 120 of the new arc lamps have been installed in some of the leading thoroughfares of the city; and they have been found very satisfactory both from the illuminating and mechanical points of view. Some difficulty has been experienced in regard to the completion of the arc-lamp contract, but the committee have taken steps to compel the contractors to effect the prompt delivery of the remainder. Guarantees have been furnished that all the arc lamps which have been ordered for the new system will be completely installed by October 15. On that date, it is expected, the working of the new system will be formally inaugurated.

BUILDING AND BUILDERS.

THE Congregationalists of Stalybridge have decided to erect new Sunday schools on the site of the old buildings in Melbourne Street, which have done duty for the last seventy years, and are now much too small to accommodate the increasing number of scholars.

THE congregation of the Bold Street Wesleyan church Warrington, are about to alter and improve the building at a cost of about 2,000/. The scheme includes the removal of the railings in front of the chapel, the erection of four ornamental lamps in their place, and the arrangement of the flags in front so as to form an open entrance to the church.

AT a number of Burnley places of worship structural alterations and improvements have been in progress for some time. The parish church scheme, it is thought, will take about six months to complete, and will entail a cost of about 4,000/. It consists of the erection of a new clergy vestry, the removal of one of the three galleries, the installation of the electric light, the erection of a memorial to the late rector (Canon Parker) and several other works.

EXTENSIVE alterations are in progress at the Oxford Road station of the Manchester, South Junction and Altrincham Railway. The old offices are to be pulled down, and the unoccupied piece of ground at the corner of Oxford Road and the entrance to the station is to be utilised for improving the approach and enlarging the station. The old build dirg on t

ite side, which is now rarely used, is to be utilised as s. A large island platform is also to be constructed, i will be reached by a subway. The erection of a more odious booking office and refreshment-rooms is also ed in the enlargement scheme.

N Wednesday the foundation-stones of a new mission h in St. Mark's district of the parish of Christ Church, Bromwich, were laid. The new church which it is sed to build will accommodate 250 persons. The cost building will be 1,000/.

London County Council's workmen are engaged in ishing a large number of houses to the north of Leather upon the site of which dwellings will be built for the se of rehousing families displaced by the progress of the 1-to-Holborn improvement. The new dwellings will e accommodation for 2,650 persons. Provision has y been made for 4,000 of the dispossessed people. in the new dwellings will run from 5s. to 12s. 6d. per e according to the accommodation provided.

OM October 1 the service to Dresden and Vienna by the ch-Hook of Holland route will be greatly accelerated. agers leaving London, Liverpool Street station, at 3 M., will be due to arrive at Dresden 10.4 P.M. the next ead of 12 55 P.M., and at Vienna via Dresden 7.35 A.M. cond day after departure instead of 2.40 P.M.

VARIETIES.

THE Eccles Wesleyan chapel has been redecorated after an installation of the electric light. The cost is about 1,000/.

THE new vicarage at Royton, Lancs, which has cost 1,900/., was dedicated on the 12th inst.

THE new women's infirmary at Stratford-on-Avon, erected and furnished at a cost of about 4,000/., to accommodate thirty-three patients, was opened on Tuesday last.

THE premises of Messrs. A. Goslett & Co., plate-glass merchants, 127 to 131 Charing Cross Road, were seriously damaged by fire on the morning of the 15th inst.

A NEW Wesleyan church at Little Lever, Farnworth, was opened last week. The church has been erected at a cost of over 4,000/., and will seat 500 persons. It replaces a chapel which has done duty since 1850.

NEW naval barracks have just been completed at Portsmouth in which accommodation is provided for over 6,000 bluejackets and stokers. The ground covered is about a quarter of a mile square, while, where the old station stood, there has been erected a handsome building for the officers.

THE formal opening of the new Linlithgow public school took place on the 7th inst. The school is a plain, substantial two-storey erection, and consists of nine ordinary classrooms, in addition to a large central hall, cloak-rooms, teachers' rooms, &c. The accommodation provided for is 548, and the cost of the building was about 5,000/.

A NEW Roman Catholic church was opened last week at Prestatyn. It has been built at a cost of 2,500/.. It is situate in Gronant Road, is built of red brick and is capable of accommodating about 200 people. It is dedicated to St. Peter and St. Francis. Mr. Edmund Kirby (Liverpool) was the architect of the new building, and Mr. T. Jones (Prestatyn) the contractor.

THE Ebenezer Baptist chapel, Burnley Lane, Burnley, which has been closed for some weeks owing to extensive alterations, has been reopened. An electric installation, consisting of 120 lights, has been supplied, and a 3-manual organ with 43 stops and 2,032 pipes, for which the organ-loft has been much extended, has been erected. The alterations are estimated to have cost upwards of 1,300/.

ON the 10th inst the president (Mr. Butler Wilson, F.R.I.B.A.) and Council of the Leeds and Yorkshire Architectural Society entertained the members of the Library

Association, who are holding their annual conference in Leeds, to a smoking concert at the Queen's Hotel, to meet the members of the Leeds Savage Club. Among those supporting Mr. Butler Wilson in the chair were the Lord Mayor of Leeds (Mr. John Ward), Professor Macneile Dixon (president of the Library Association), the vicar of Leeds (Dr. Gibson), Sir W. H. Bailey, Lieut.-Col. Robinson, Mr. Edmund Bogg (chief of the Leeds Savage Club), the Rev. N. Egerton Leigh, Dr. Coleman, Mr. F. H. Barr and Councillor S. A. Hirst.

THE new Roman Catholic church of the Holy Ghost, at Basingstoke, which has been designed, built and adorned entirely at his own cost by the Very Rev. A. J. C. Scoles, rector of the Roman Catholic mission at Basingstoke, in celebration of his silver jubilee as a priest, was opened on Tuesday. The site of the church adjoins the ruins of the famous Chapel of the Holy Ghost, which was demolished by Cromwell's army in the days of the Commonwealth at the time of the siege of Basing House. The new church is in the Early English style and the interior is elaborately decorated. The altar is of onyx, the pillars of marble and the tabernacle of pure gold.

THE new church at the Cottridge, Worcestershire, was dedicated on the 10th inst. It is designed to seat 700, and has been built at a cost of 10,000/. Messrs. Cossins, Peacock & Bewlay are the architects, and the architecture is a modern adaptation of the style which prevailed at the close of the fourteenth century. The principal materials used are red Leicester bricks, with external dressings in terra-cotta, and internal details in green Quarella stone. The chancel, with flatly canted apsidal end, is 35 feet long, 27 feet 6 inches wide and 32 feet high at the wall plate. The organ chamber opens on the north side of the chancel, and in the south side is a chapel for week-day services. The nave and aisles are 95 feet 6 inches long, have open timber roofs at a flat pitch, covered with green slates. The church is admirably lighted, the clerestory having two windows and two lights in each bay, whilst there are coupled windows in each bay of the aisles. The chancel window has five lights, and the west window, of nine lights, is notable for its fine tracery. The contract was placed in the hands of Mr. W. Harvey Gibbs, of King's Heath.

ST. EDMUND'S CHURCH, Hunstanton, was consecrated on the 5th inst. The church, situate on rising ground within sight of the sea, is a well-proportioned structure of flint and stone, with Carstone dressings, in the Decorated style of archi-

ture, and consists of nave, chancel, north and south and western porch, but has no tower. It has seating accommodation for over 650. The commencement of the erection of the building dates back to 1864, when the work was begun by the Rev. W. M. Church, vicar of Hunstanton from 1864 to 1871. The chancel was opened in 1865, but the building was partially destroyed by a storm in 1870. Following the vicar of the Rev. W. M. Church came that of the Rev. Augustus Walker, and shortly after his advent to the parish he renewed the effort to erect a suitable place of worship in what is known as New Hunstanton. With only 200/ in hand a contract was signed for the erection of a church, consisting of the nave, chancel, nave and south aisle, at the cost of 2,700/. The church was opened and dedicated by the Bishop of Rochester on July 29, 1872. Other additions have been made to the building, viz. the north aisle and a western porch. The total cost of erection has been about 4,000/. The internal additions include a richly-carved pulpit, formerly in the choir of the borough Cathedral.

IMPORTANT sewerage works have just been completed at Ashton-under-Lyne, and were formally inaugurated on Wednesday last. They are situated on land about 43 acres in extent on Plantation Farm, in the borough of Dukinfield. They were begun in 1899, and the bacteria system was adopted. There are bacteria beds are fifty-six in number, and each is about one-twelfth of an acre in area, with a working depth of about 3 feet. For dealing with storm water there is a set of nine filter beds with a total area of about 1½ acre and a working depth of about 3 feet. The roughing and precipitation tanks are intended to be worked continuously, and are capable of containing 1½ of the daily dry-weather flow, which is estimated at 1,237,000 gallons. The filtering medium in the bacteria beds is composed of rough clinkers, brickbats and fine clinkers, the coarsest layer being at the bottom and the finest at the top. It is intended to work these beds in cycles of eight hours a day, and under this system they will be capable of dealing with about 2,700,000 gallons every twenty-four hours, or six times more than 2½ times the daily dry-weather flow. The works include commodious administrative buildings. The estimated cost of the whole undertaking is 88,000/, for which borrowing powers have been obtained.

THE authorities at the St. Louis Exhibition 'say the *Chronicle*, true to the national ideal of "licking creation," are about to erect a tower which will be the highest in the world.

to be a pharos, or round column, constructed entirely of iron, 350 yards high. Round the outside walls a railway will be fixed in corkscrew fashion, up which an enormous carriage will convey over 800 passengers at once to the top, while inside the tower immense lifts will be continually going up and down for those who prefer that mode of travelling. The cupola at the top will hold 7,000 people, and will be surmounted by the greatest mast in the world, from which will float the largest flag in the world. The inside of the tower is to be set from top to bottom with crystals, over which rays of different colours will be sent, so that the passengers will have the impression of looking through an enormous diamond. Round the foot will be an immense lake, whose waters, agitated by powerful machines, will rise in waves which, of course, will also be the biggest in the world. The Eiffel Tower and all other structures in the effete Old World are, indeed, to be hopelessly outmoded, and once more we get a concrete example of the African tall story.

DURING the summer (says the Scotsman) alterations have been in progress at Balmoral Castle, not of any structural importance, but having to do more with the internal economy and efficient working of the domestic side of the establishment. This year certain antiquated kitchen arrangements were dealt with, and a new installation of hot-water pipes to the bath-rooms, &c., was introduced. This year what was done was to remodel and extend the accommodation for servants by the addition of a new wing. The external features of the new wing are of a pleasing character. The work is in grey granite, and its architectural features consist of dormer windows and five chimney heads. In the pediment of each dormer is an ornamental sculptured design. That in the centre is the royal monogram "E.R.," and the date 1903; another is the Scottish lion enclosed in a treasure; a third a crown surmounted by the rose, the thistle and shamrock around it. An internal reduction into the castle of a luggage and coal lift, which it has not possessed. Nothing has been done to the royal apartments or to the guest chambers, which in 1840 as they were in the time of the late Queen, but the entrance-hall has internally been considerably improved in appearance. Formerly the walls were of plain wood; now they have been panelled with the native Scottish pine grown in the Royal forest. The panelling extends to the top of the walls, and the space between it and the cornice has been left blank for the heads. Fronting the entrance is a large niche, where

for many years stood a statue of Malcolm Canmore. This has been removed to the ball-room, and in its stead has been placed upon a suitable pedestal an early bust in white marble of Her late Majesty, which formerly stood on a simple bracket on one of the side walls. On an ornamental panel below the pedestal has been carved "Victoria, 1819-1901," and on a similar panel over it appears the Royal monogram "E.R.," with the date 1903. An overmantel of beautiful design, executed in Scots pine, has been constructed over the fireplace, and in the centre is a square panel, on which has been carved a fine representation of the Royal arms, copied from the Great Seal of Scotland, with the Scottish lion in the first and fourth quarter. Sir Rowland Anderson, Edinburgh, was entrusted by His Majesty with the work at the Castle.

INTERNATIONAL FIRE EXHIBITION,
EARL'S COURT.

THE awards have just been made by the jury in connection with the above exhibition, and it is not surprising to find that Messrs. Merryweather & Sons and Messrs. Shand, Mason & Co. have secured so many medals for their fire-extinguishing appliances. The Columbian Company have secured two gold medals for fireproof construction. We notice also the Expanded Metal Company, for metal lathing, St. Pancras Iron Company and Ratner & Co., for building equipment, have secured gold medals. The following list of awards will doubtless be of interest to our readers:—

THE CITY BRIDGES.

Annual statement of the produce and expenditure of the House Estates of the City shows that last year, ending a balance from 1901 of 3886*l.*, the receipts were 3*l.*, of which 117,368*l.* was produced by rents and quit rents, 3,322*l.* by interest on securities, and 9,456*l.* realised by the sale of a piece of land on the southern approach to the Tower Bridge. The expenditure amounted to 117,452*l.* The expenditure of the estates and the collection of rents cost 1,848*l.*; the lighting, cleaning and repairing of London Bridge, 2,805*l.*; Southwark Bridge, 1,120*l.*; and the Tower Bridge, 18,961*l.*; the City Fund, for watching the bridges, 2,000*l.*; interest on Bridge loans, 32,925*l.*; and loans repaid, 34,424*l.* There is thus a balance to the good on the year of 19,981*l.* Loans remaining on the Tower Bridge amount to 32,000*l.*, of which 35,600*l.* will be paid off during the present year. A loan of 32,000*l.* has been raised for the widening of London Bridge, which is now in progress.

HUNGERFORD DRAINAGE SCHEME.

Hungerford Rural District Council having applied to the Government Board for their sanction to borrow 8,500*l.* for the purposes of carrying out works for sewerage and sewage disposal for the parish of Hungerford, Colonel A. G. Durnford, Local Government Board Inspector, attended at the Council, Hungerford, on the 11th inst., to hold an inquiry into the application.

Considerable interest had been aroused by the proposed sewerage and drainage schemes, and there was a representation of residents in the district. Others also present were:—Mr. R. O. B. Lane (counsel for the Hungerford Rural Council, instructed by Mr. H. D'o. Astley, clerk), Mr. Humphries, consulting engineer (a member of the engineering firm of Trant, Brown & Humphries, of Westminster), Mr. Durnford and Mr. Murphy (representing the Great Western Railway Company), Mr. Drummond and Mr. Barnett (representing the Thames Conservancy), Mr. H. D'o. W. Astley (representing the Rural Council), Mr. Earle (Feoffee), Mr. Hawkins

(assistant overseer), Mr. Powell (surveyor, Hungerford Rural Council), Mr. C. R. Hopkins (vice-chairman, Parish Council), Dr. Major, Mr. Harding and Mr. Mapson (Hungerford Rural Council), Messrs. Beard, E. Lowe and Phelps (Hungerford Parish Council), and Messrs. Platt, E. Barnard, Fowler, Parfitt, Adnams, Cundell, J. Dredge, A. E. Allright, &c.

Mr. Lane, in opening the case for the Hungerford Rural Council, drew attention to the fact that that body had made application for sanction to borrow the sum of 8,500*l.* in respect to the drainage of Hungerford. There had been several previous schemes under the consideration of the Council, but great difficulty had been experienced in the matter of getting the land. He thought he should that day be able to show that the land now suggested was practically the only suitable piece which the Council were able to get. In one of the previous applications, the Local Government Board were willing to grant the application, and gave their sanction on condition that the land was raised 2 feet, but it was found that the expense would be too great. That day Mr. Humphries would tell them as to the suitability of the present land.

Mr. Humphries, who said he was engaged upon the preparation of schemes for sewage disposal, then gave details of the scheme, which, he said, was most up to date, and, besides being economical, was eminently fitted for a town the size of Hungerford. Three-eighths of the sewage would be taken to the outfall by means of gravitation, so that they would only have to pump five-eighths, which would in itself be a considerable saving of expense. There would be three ejectors to lift the sewage, one to be in the High Street, so as to save boring under the canal. The lifting capacity per day would be considerable, raising some 11,000 gallons per day.

Mr. Saunders, representing the Great Western Railway Company, made an objection to the situation of the proposed works, in addition to their being near the Great Western Railway station.

Mr. Humphries assured Mr. Saunders that no nuisance would be caused, as the sewage would not appear in the open until it had left the septic tank.

Mr. Alexander, one of the residents in the neighbourhood where the mains will cross his property, asked if they would receive compensation for any loss sustained.

Mr. Humphries assured Mr. Alexander that ample compensation would be awarded.

This ended the inquiry, and Colonel Durnford and others proceeded to the proposed site to inspect it.

JENNINGS' PATENT

DUPLICATION BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTE.

Upwards of 5,000 in Use in Various Parts of the Country
in Public Baths, Asylums, Hospitals, Infirmarys, Hotels,
and Private Houses.

Cold water can only be admitted first, thus preventing
damage to the Bath, and injury to Bather from scalding.

Supplied to H.M. the King at Windsor Castle, and various
Residences of the Nobility.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE.

THE "LONDON" WARMED FRESH-AIR
VENTILATING GRATE & STOVE,

IN THE BANK OF ENGLAND and BRANCHES; the CAMBRIDGE HOSPITAL, ALDERSHOT,
and other important Buildings.

SILICON AND IRON.

At the meeting of the Iron and Steel Institute Mr. Thomas Baker (Sheffield) read a paper on this subject. Professor Howe, he said, after studying the various theories put forward by different authors, concluded that there was no direct evidence that silicon had any bad effect on the toughness or durability of steel. From particulars of experiments made by Mr. Hadfield, Mr. H. H. Campbell had deduced that silicon cannot be classed among the highly injurious elements. It would therefore, said Mr. Baker, only be reasonable to suppose that small quantities could not exert a very deleterious influence. The chief difficulty in the various experiments appeared to be that of obtaining iron in the molten condition sufficiently pure and ferro-silicon with small amounts of carbon and manganese. Mr. Baker proceeded to report the result of a research conducted by himself, having for its object the preparation of a series of alloys of silicon and iron, with traces only of other elements. Silicon, he said, seemed to confer upon iron the property of passing very quickly from the liquid to the solid condition, resembling in this respect the effect of phosphorus on copper and tin. With regard to the effect of silicon on the mechanical properties of iron, Mr. Baker stated that although the addition of silicon to iron increased the elastic limit and tenacity of iron, such increase was only obtained by loss of ductility, which loss, provided the material had been well annealed, was very small until the silicon reached 3 per cent., after which it became very great, the ductility almost becoming zero, with 4 per cent. of silicon. The alloys gradually increased in hardness with the addition of silicon, and after exceeding 5 per cent. silicon required great skill and care in machinery in order to avoid fracture of the bar.

Professor Turner and Mr. Alfred Campion (Carnegie gold medallist) bore testimony to the value of the work of Mr. Baker, and this concluded the papers.

A SANITARY CRUSADE ROUND THE WORLD.

MR. ROBERT BOYLE, of Robert Boyle & Son, the well-known ventilating engineers of London and Glasgow, has recently returned from what constitutes his eighth sanitary crusade round the world, he having circled the globe that number of times, preaching the gospel of pure air, and advocating the

adoption of hygienic measures that would tend to secure better health and consequent welfare of the peoples of many countries he has visited from "China to Peru," Boyle having on one of his crusades travelled through to its most remote boundaries, and last year the West Indies and South America. Mr. Boyle is a practical as well as a scientific exponent of the laws of health, having devoted his whole life to the cause, and among the many benefits conferred on humanity as a pioneer in sanitary reform may be mentioned the 100,000l. gift he made last year on the occasion of His Majesty's Coronation, for the purpose of promoting teaching of hygiene in the schools and colleges of the empire, and inculcating the benefits to be derived from breathing pure air, and so make a strong and healthy people and a strong and healthy empire.

OIL FUEL.

THE increasing interest and steady progress in the employment of oil as fuel for various purposes suggests the compilation of a paper submitted by Mr. A. M. Bell to the British Association.

Oil fuel has been a favourite field for the ingenuity of inventors for many years. The first applications appear to have been made in France, but numerous experimental stations have followed, and in Russia its general employment may be said to have commenced about 1870, when the development of the enormous oil supplies of the Apcheron peninsula became an accomplished fact and the first oil-fuel station appeared on the Caspian Sea.

In the United States, where the crude oil of the Pennsylvania field contains a larger percentage of light oil, the use of liquid fuel until recently has been on a less extended scale. Now, however, the discoveries in California and Texas have provided enormous supplies of crude oil, practically only suitable for this service, and great advances have consequently been made in its use.

In this country many attempts have been made, but owing to the absence of regular supplies progress has not been so rapid as in the cases mentioned above. The manufacture of oil gas and carburetted water gas has, however, thrown on the market products of a character only suitable for a limited scale.

The different methods of burning oil fuel may be summarised as follows:

ACETYLENE LIGHTING

allows:—(1) Those wherein it is burned in bulk form; (2) in a sprayed or atomised condition; and (3) consumed as gas. The first mentioned procedure has received little application in Russia, whereas the last has enlisted most attention in the United States owing to the lighter character of the oils available. Generally, however, the second or spraying system may be looked upon as the favourite, most readily adopted, and probably the most successful; hence the attempts at improvement appear to have been devoted to the most effective device is doubtless that requiring the least quantity of the atomising agent (steam or compressed air) for operation, and until recently the attention of workers in this direction has been centred on the burner employed, the construction of the furnace, which is of as much importance for good result, being somewhat neglected. Further, a due consideration of the admittance, distribution and temperature of the air for combustion is absolutely essential to success. The latest developments of spraying apparatus point to the employment of oil fuel under pressure, heated to a high temperature, sprayed with dry steam, and the fire fed with heated air for combustion.

For steamers the use of oil fuel possesses advantages over an excess of those which can be urged in its favour when employed on land: reduced storage space, less number of men required, an increased steaming capacity from a given supply of fuel, are points of the greatest value from the marine aspect of the question.

For locomotives the assistance of oil fuel is valuable on the runs without stopping, now becoming common, the difficulties of firing and the trouble from dirty fires being no longer so great. The application in this direction has been much improved and simplified during the past few years with a view to ensuring the reliability of the apparatus under all conditions of service, and the method devised by Mr. Holden, of the Eastern Railway, of arranging the apparatus has been recently adopted owing to the opportunities it affords for the use of solid or liquid fuel, or both, at will or as circumstances may make most desirable.

In Russia and the United States some hundreds of locomotives are regularly running, using oil as fuel; and numerous examples are to be found in this and other countries where coal has become an expensive commodity.

For furnace work oil fuel offers unique advantages, and interesting applications have been made to meet the requirements of annealing, tempering, metal melting,

brazing, &c. In glass-making and enamelling oil fuel has met with considerable adoption, and portable furnaces of all kinds are successfully operated with it; in bridgework, shipbuilding, &c., oil-fired rivet furnaces are to be preferred to any form of solid fuel-heating device.

In storage oil fuel has many favourable features. It occupies a minimum of space, does not deteriorate by exposure, and is easier of transportation and distribution.

In the Far East and many Oriental countries the importation of oil fuel has now become a regular undertaking, and supplies are guaranteed in many cases where wood has become scarce and imported coal an almost prohibitive article.

BRITTLINESS OF STEEL.

THE ability of materials in general and steel in particular to withstand shock is a subject of great importance to all engineers, and a paper by Mr. E. G. Izod was read before the British Association on the pendulum apparatus for testing steel as regards brittleness, giving an outline of the systems generally in use for carrying out brittleness tests, with remarks on each; and further explaining the use of the pendulum apparatus, as used by Messrs. Willans & Robinson, with the reasons that led to its adoption.

Tests by shock or tests for brittleness have from the earliest times been used by engineers, especially on the Continent; and Swedenborg, in 1734, gives some interesting particulars of the rule-of-thumb tests carried out by purchasers of iron in those days; and in nearly every case an impact or brittleness test was used, which though only empirical was no doubt all that was required, and gave a deal of useful information.

At the present time, probably owing to the state of perfection to which the testing machine has been brought, there is too much inclination to neglect other properties of material which the usual tests do not detect, but which are quite as important as the usual standard physical tests; and that this is so is shown by M. Fremont's paper, published by the Société d'Encouragement pour l'Industrie Nationale, September 1901, in which he throws an extraordinary light on the brittleness question, and gives several instances where serious fractures in structural and other steel were not accounted for by any of the ordinary testing methods, but were readily explained when tested for brittleness by an impact machine.

At Messrs. Willans & Robinson's, Rugby, it has long been

felt that a method of testing such as used by M. Fremont and others was wanted to detect the reason for certain fractures which were inexplicable by the ordinary methods used; and an experimental pendulum impact machine was made, and the tests carried out with it gave promise of such good results that a standard machine was made and is in use at the present time, giving results which gain in importance with every series of experiments carried out on it.

Many types of impact machines are used, but the pendulum form of apparatus seems to give most satisfactory results; it can be calibrated to give direct readings for energy absorbed, and lends itself to very quick working even by an inexperienced operator.

The idea of the arrangement is as follows:—A weight is suspended pendulum-wise on a stiff rod, which swings from a centre designed to be as frictionless as possible. This weight or tup is then moved out of the vertical and allowed to fall on to the free end of a test-piece gripped by the other end in a vice, the specimen being notched to locate the break, the height of fall being always made sufficient to cause fracture with one blow. A suitable measuring arrangement is used to record the energy remaining in the weight after fracture of test-piece has occurred; and this subtracted from the calculated energy in the tup before fracture gives the energy required to break the specimen. Measurements are taken of the test-piece, and results are transferred to equivalent energy absorbed on specimen 1 inch square.

WHITWORTH SCHOLARSHIPS AND EXHIBITIONS.

...ples of galvanised iron wire and of copper and tinned
er wire were also submitted to atmospheric exposure. It
ared that all the samples of aluminium gained in weight
g exposure, and that all were pitted and corroded,
ially on the under side where the water drops had
cted and dried. The rods appeared to have suffered
r less than the wires, and it was therefore probable that,
e course of drawing down, aluminium wire underwent
ical change. The author claimed to have proved that
of the aluminium rod and wire which was being manu-
red and sold in England for electrical purposes in the
1899 and 1901 was not able to stand atmospheric
sure on the coast of Lancashire without corrosion. It was
a fair deduction from these exposure tests to assert that
inium manufacturers had yet to prove the metal a satis-
y and durable substitute for copper in bare overhead
mission lines, or for electrical work which involved
sure to climates near the sea coast.

Mr. B. Hopkinson gave instances in which aluminium
ed with 1·12 per cent. of iron to give it hardness had been
for electrical conductors, and had to be discontinued
y to its high co-efficient of expansion, which led to its
ng in hot weather.

Professor Wilson pointed out that the test wires were ex-
i to sea air, and so did not have an average test, but he
ot think, even on the figures shown, that it came out very

Mr. Ernest Wilson read a paper on the electrical con-
vity of certain aluminium alloys as affected by exposure to
on atmosphere. Two series of tests had been made. A
er aluminium alloy had not diminished in conductivity to a
er extent than copper, but further exposure had a detri-
cal effect. The author concluded that copper alone should
e used in comparatively large quantity for exposed light
inium alloys.

BUILDING SOCIETIES.

...is address to the Economic Science and Statistics Section
e British Association Mr. E. W. Brabrook said:—
has been observed that the co-operative societies are
ly undertaking the work of providing houses for their
bers, and to that it may be added that the friendly
ties are more and more tending to adopt the practice of
ng money to members on mortgage as one of the most

remunerative forms of investment open to them. The building societies, which were established for that purpose only, are still carrying on the same work, and the combined operation of all three ought to produce a material effect on the prosperity and well-being of the industrial population. Building societies alone advance as much as 9,000,000*l.* a year on mortgage.

Building societies have passed through a crisis. The incorporated societies reached their highest point of prosperity in 1887, when their capital amounted to fifty-four millions; by 1894 it had fallen to below forty-three millions. The Building Societies Act, 1894, required of societies a fuller disclosure of the real state of their affairs than had previously been called for. The result was to show that, apart from the special scandal caused by the fraudulent proceedings of the Liberator Society, there were hitherto undisclosed elements of weakness in the management of building societies that justified the withdrawal of the public confidence that had been reposed in them. The properties in possession before the passing of the Act of 1894 were not less than 7,500,000*l.*; they are now less than 3,000,000*l.* This points to the fact that the early prosperity of building societies had led to the establishment of more societies than the public demand called for, with the consequences that societies competed against each other, and that in the stress of competition and the anxiety to do business they accepted unsatisfactory securities, which must lead to loss upon realisation. From this point of view the effect of the Act of 1894 has been wholly salutary. Year after year the societies have reduced their properties in possession. The evils which they dreaded from the disclosure of the facts have not arisen. At this day it may be said that the societies as a whole have regained the position they held in public confidence, for the members now know the worst. They know, too, that where the blight of properties in possession still infests the business the managers are resolutely endeavouring to diminish its effect.

I need hardly repeat what has so often been said of the economic value of a sound building society. The man who by its means gets a stake in the country mounts many steps on the social ladder. When he has paid off the mortgage on his own dwelling-house, and so liberated himself from the obligation to pay principal and interest, either in the form of repayment annuity or of rent, what is to prevent him from buying in the same manner as an investment another house with the income thus set free, and so on?

There are still sixty-eight building societies which remain under the operation of the Act of 1836, having been established

before 1856, and not having availed themselves of the option of taking upon themselves the responsibilities and the privileges of the Acts of 1874 and subsequent years. One Society (the Birkbeck) stands by itself, as, although its business as a building society is considerable—the new advances granted on mortgage last year having been for 120,000*l.*—its main operations are those of a deposit bank, and it keeps the far greater part of its funds in investments on liquid securities. The other societies are pursuing the even tenor of their way, just as they have done for the last fifty years, and show on the average an increase of business from year to year. But the great body of building societies are those which are incorporated under the Acts of 1874 to 1894, exceeding 2,000 in number. They have so far recovered from the effects of the depression that their assets are now 48 millions, being midway between the low-water mark of 1894 and the high-water mark of 1887. That and the fact that they have in about seven years reduced their properties in possession by about 60 per cent. leads to the inference that they are now, speaking generally, in a fairly healthy condition, and that many years of usefulness are still to be expected for them.

ELECTRICAL PROPULSION.

A PAPER was read by Mr. James N. Shoolbred, C.E., at the meeting of the British Association, in which he said that the tendency of the last few years has been, in England and elsewhere, to introduce electric-tractive power—on tramways, on railways, on road carriages, on canals, in automobiles and in other ways. But these various groups have each been acting independently of the others—isolated, and in some cases actuated thereto by motives of jealousy or of hostility due to the dread of conflicting commercial interests. Besides the above proposed applications for electrical traction there have sprung up in various directions what may be termed "universal providers of electricity," under the head of electrical power schemes, &c., to acquire a right, nay, even a practical monopoly, over very large areas, to provide a supply of electricity for, within certain limits, all purposes, whether for locomotion or for stationary purposes. It is only reasonable to suppose that if, instead of a number of conflicting interests, the various parties could be made to combine and fuse together the several portions of their common work, so as to avoid a repetition, and antagonistic, in some cases, of some

portions thereof, there might then arise mutual benefit as well as economy, not merely to the operators themselves, but to the community at large. One difficulty lies in the conflicting interests and in the jealousy amongst the various classes of operators. But another danger to the public, more especially in the monopoly which virtually might thereby be afforded to the operators. An attempt has been recently made by the Liverpool Corporation, the Mersey Docks and Harbour Board and the South Lancashire Electric Tramways to give expression to this tendency for co-operation among the various workers, and there are indications in Yorkshire and elsewhere of similar tendencies coming into operation. Although the result so far of the attempt above referred to has been rather accentuated than otherwise the difficulties which beset an undertaking of such a character, yet the benefits which will ultimately accrue to the public (say in cheapening the cost of transportation by a more comprehensive and united action among the workers) fully warrants their being discussed.

NEW NURSES' HOME, BIRKENHEAD.

THE nurses' home, which has been erected in connection with the Birkenhead borough hospital, is now completed, and the opening ceremony takes place on the 26th inst.

The home has been erected on land adjacent to the hospital, which was purchased a year or two ago from the Corporation of Birkenhead. The building, which fronts Livingstone Street, is L-shaped in plan, and consists of ground and first floors. It contains on the ground floor entrance porch and vestibule, with lavatory and w.c. off same, dining room, nurses' day-room, head nurse's room and nine bedrooms for nurses, access to these being obtained from a spacious well-lighted corridor, at one end of which is placed the sanitary tower, containing bath-room, housemaids' sink, &c. At the back of the dining-hall are the usual administrative offices including still-room, store-room and pantry. Access to the first floor is obtained by means of the staircase, which is external in pitch pine. The accommodation on the first floor consists of a nurses' sitting-room and ten bedrooms for nurses and a large bedroom for servants, the sanitary tower being duplicated above that on ground floor and similarly fitted up. A provision is also made on this floor for stores and linen, and a large box-room has been placed in the roof above the staircase landing.

Special provision has been made for egress in case of fire.

GLAZED BRICK

means of an external doorway at the end of the first-floor corridor, which leads on to an iron fire-escape staircase. A similar doorway fitted with special bolts is also provided at the end of the ground-floor corridor. Efficient ventilation of all rooms has been obtained by means of Tobin tube inlets and flap extract ventilators, the vitiated air being carried away through funnels, formed above the ceilings of both ground and first-floor corridors, and connected to an air exhaust ventilator fixed on the ridge of the main roof. In addition to this each room (including nurses' bedrooms) is provided with a fireplace having a special exhaust ventilating flue built in the chimney-breast. The dining-hall and day-room on the ground floor are comfortable, if required, into one room by means of a patent folding partition, which has been executed in oak. These two rooms being dedicated to the memory of the late Mr. Wm. Laird, special attention has been given to their decoration, the wall-pieces, overmantels and chair rail being executed in oak designs prepared by the architect, and an ornamental and gilded dado in "Tynecastle" is carried around the room, the rest of the wood being enamelled white and the walls painted a light tint. A feature of the overmantel in the dining-hall is a well-executed portrait of the late Mr. William Laird, and cold water services are laid on to the various bathrooms, lavatories, sinks, &c, the former being obtained from an independent boiler fixed in the basement, and by means of circulating pipes a constant supply of hot water is obtained. The building is lighted throughout by electricity, and special attention has been given to the sanitary fittings, drainage and ventilation. Externally the buildings are faced with grey bricks relieved by Ruabon moulded brick strings and bands, the windows being segmental-headed filled in with double-hung sashes, and decorated externally with red bull-nosed quoined jambs, sills and eaves, the eaves and gable cornices and chimney caps also being executed with red bricks and the roofs covered with slate. The site on the Livingstone Street frontage is enclosed by a low brick wall, surmounted by ornamental iron palisading to match those in front of the existing hospital buildings, and the folding gates in same hung to ornamental stone piers. The contract for the building has been entrusted to Mr. Peter Bell, of Birkenhead, and that for the oakwork in connection with the dining-hall and day-room to Messrs. Waring & Low, of Liverpool, the whole being carried out from the designs prepared by, and under the superintendence of, Mr. J. and Kirby, F.R.I.B.A., of Liverpool.

WOLVERHAMPTON TOWN HALL.

THE municipal buildings of Wolverhampton, which have long been inadequate to the constantly growing demands upon them, have now been enlarged and embellished at a cost approaching 20,000*l*. In the town clerk's department, to the right of the main entrance, the several clerks' offices have been thrown into one large well-lighted apartment, arranged with glass screens to form an inquiry office and waiting-room, and, by the removal of the old staircase at this end of the corridor, an additional private office has been provided for the assistant town clerk, while in the basement an extensive room has been made in which to store electoral papers and other documents. At the rear of the main building on the ground floor additional office accommodation has been provided for the vestry clerk and his staff, and has been fitted with teak desks and counters, and arranged for the greater convenience of the public as well as the officials. In the corresponding block on the north side a large office has been provided for the borough accountant and for the receipt of rates under his control—an alteration which will doubtless be much appreciated by the public using the department, which has hitherto been much too small for the purpose. New storeys have been erected over these two wings and over the police barracks. These are approached from the vestibule by means of a handsome new staircase constructed of Hopton Wood stone, partly polished, the walls being faced with polished Pavonazza marble, lined out in panelling with Ogwell marble, and producing an extremely rich effect. In a niche on the first landing of the staircase, and immediately facing the principal entrance, has been placed the marble statue of the late Mr. G. B. Thorneycroft. The staircase on either side gives access to the main corridor of the upper storey, where are provided on the south side new and extensive apartments for the borough surveyor, and on the north side is the borough accountant's office. The whole of this portion of the new buildings has been carried out in a plain and substantial manner, the floors being of fireproof material covered with wood blocks. A new staircase has been placed at the Blossomfold entrance to the hall to replace that taken away from the north end of the main corridor, and the front portion of the first floor is also approached from the main staircase by a corridor which has been carried across the upper portion of the sessions court. An additional committee-room has been provided where the

vestry clerk's office and the staircase formerly stood, and what was the mayor's parlour over the main entrance to the hall has been converted into a retiring-room for the aldermen and councillors. Several desirable sanitary improvements and additions have been included in the scheme of alterations, including properly-fitted lavatories for each department. In the basement of the hall additional muniment-rooms have been provided for the several departments, the cooking arrangements have been remodelled and placed in a more convenient situation, and the walls of the kitchens have been lined with glazed tiles and the whole fitted with modern appliances. The lighting throughout the building is excellent. A new feature in the vestibule is the provision of a balcony, and this will be used by the musicians during the holding of the mayoral and other banquets.

The appearance of the council chamber has been almost entirely changed. The temporary canvas ceiling has been removed with all its dirt and dust, and a new plaster ceiling, 6 or 7 feet lower than the original, has been constructed and finished. The lighting of the chamber has also been improved by the insertion of a new three-light window in the north wall, which, together with the two old windows, has been glazed with leaded lights containing in the centre light in the principal window the new borough arms, while the minor lights have each a shield from the old borough arms. In the old windows are represented the arms of the Thorneycroft and Wrottesley families. On the south side of the chamber a public gallery has been erected, supported on massive oak columns with carved capitals and cantilevers, and having a handsome carved strap-work front, in the central panel of which is introduced the new clock presented by Alderman Joseph Jones. The clock-face, which is of very handsome and artistic design, has been executed in cast bronze, and in front is a winged figure carrying the "circle of the hours" and supporting an enamelled dial, on which the hours of the day are inscribed in Roman numerals. On either side of the figure is a symbolical representation of "Industry" and "The Flight of Time," and below these are inscribed the name of the donor and the date of the gift. The work has been designed and excellently executed by the Bromsgrove Art Guild. Below the moulded cornice the walls of the council chamber have been lined with moulded oak panelling, and there is a splendid canopy over the mayor's chair. Above the panelling the wall space has been coloured a rich deep crimson, with panels of old gold tint; the pilasters and arches are

picked out in ivory white, with the ceiling and cornices same colour. New oak doors have been hung on the east and west sides, the old doors have been made to match the new work, and the floor has been laid with oak blocks on concrete foundations. Under the supervision of the borough engineer (Mr. C. E. C. Shawfield) the old electroliters have been renovated and refixed, and for ventilation an electric fan has been fixed in the space above the ceiling and connected to the new ventilating shaft in the roof.

Approached from the corridor to the left of the main entrance of the town hall, in the space previously occupied by the borough accountant, apartments have been arranged comprising the mayor's parlour and reception-rooms. These are handsomely finished with moulded mahogany panelling, chimneypieces, heavy wrought-iron dog-grates, with tiled and Pavonazza marble margins and curbs, while the mayor's parlour is an exceptionally fine specimen of cast bronze. The whole of the metalwork, as also an elaborate and effective electroliter in silvered bronze, and the door furniture and other fittings have been executed by the Bromsgrove Art Guild. The rooms are handsomely furnished.

The old fire-brigade station having become wholly inadequate now that the borough possesses two steamers and a manual engine, a new station has been erected in Redd Street, with stabling, workshop and lamp-room attached, the whole fitted with the most up-to-date appliances. The station has been provided with offices for the medical officer of health for the borough and the other officers of the fire department, while the rooms formerly occupied by the office of this department have been converted into a residence for the chief superintendent of police, who formerly lived at a considerable distance from the fire-station.

Notwithstanding the difficulties under which the alterations have been carried out in consequence of many of the old and police courts being used during the operations, the work of the contract has been completed in about two months less than the contract time. By the carrying out of these alterations and additions the office accommodation has been increased from an area of about 8,800 superficial feet to 9,400 feet. Convenience of access both for the general public and the officials has been kept in view, and the utility of the buildings for the transaction of business has been enhanced. The work has been carried out according to the plans and specifications prepared by and under the supervision of Mr. Fred. T. Beck, architect, Wolverhampton.

JAMES CARTLAND & SON, LIMITED.

The Architect.

THE WEEK.

It is satisfactory to learn from an official return how large a proportion of the cases arising under the Workmen's Compensation Acts are arranged without law suits. The litigated cases were not even one per cent. of the claims. No doubt it is an agreeable intellectual exercise for judges and lawyers to discuss whether a board laid in one way forms a scaffold and in another remains a board, what is the meaning of a height of 30 feet and similar abstrusities. But meanwhile employers, workmen or their representatives and insurance companies suffer by the delay. A genuine point of law rarely arises, for cases turn on technicalities which are fully known only to employers and employed, architects and engineers. Unbought equity is adapted for them. The official return says of last year:—"As compared with 1901, there has been a falling off both in the number of cases taken into the Courts and in the number of appeals to the Court of Appeal. As in previous years, the great majority of claims were settled by agreement, and only a small percentage were made the subject of formal litigation. In cases of death, where the claims are for comparatively large sums, we should expect to find that a good many are disputed." Whatever officials may think, it would, however, be preferable if the outlay which the cury of litigation always imposes were employed in increasing the sum to be paid to the family of the deceased workman. During the year the sum of 44,353*l.* was awarded for deaths, the average being 168*l.* *os.* 1*d.* In 1901 the average was 188*l.* 7*s.* 6*d.*, in 1900 it was 13*l.* 8*s.* 9*d.* and in 1899 it was 173*l.* 1*s.* 7*d.*

THE Building Exhibition at the Brighton Aquarium opened on Wednesday. But, as is often the case, the management had not allowed sufficient margin of time to permit of everything being put in thorough working order. It has resulted in the absence of any official catalogue. The exhibition has been moulded on the lines of the displays at the Agricultural Hall, and has similarly a collection of architectural drawings which represent structures erected in Brighton, or designs by local architects. The number of drawings is not very numerous, but it would have been wise if they had been numbered to simplify reference to the printed list. As a concession to the unprofessional visitors some architectural photographic studies have been hung by the side of the drawings. In close proximity the students attending the Municipal School of Science and Technology may be seen engaged in various branches of the building trade. The exhibition includes many of the leading British manufacturers and are sometimes represented through agents at Brighton. Local or county firms have also taken part in the exhibition, which is of an interesting description. A prominent feature is the introduction of working exhibits, in which are shown the method of printing wall-papers, the manufacture of pottery, the composition of coloured glass panels, the staining of wood-panelling, &c. By this means it is hoped to attract the attention of visitors, who would otherwise have but little pleasure from a technical exhibition. The Arts Department of the Brighton Town Council have reserved a space for the display of their activity. Blocks of step cement, kerbing, channel stone, &c., are shown which are composed out of the refuse of the dust destructor of the stalls are connected with the adornment of the street when finished, and comprise fittings of many descriptions.

MANCHESTER has been taught a lesson about the public advantages of technology which will be more effectual than any speeches or essays. In equipping the Municipal Laboratory of the system adopted in Bradford of providing a series of different kinds to exemplify testing processes proposed to be followed. The city already possesses a laboratory which belongs to the Chamber of Commerce, but deals only with the chemical and mechanical testing of iron and cloth. The Chamber will co-operate with the

Corporation for the establishment of a municipal testing-house which will be available for students of the School of Technology as well as people who are willing to pay for information. Already various applications have been made and a variety of tests—chemical, metallurgical, electrical and mechanical—some for various departments of the Corporation and others for the public, have been undertaken, whilst other cases were declined. It is intended that the tests are not to be confined to materials for textiles, but to comprise the testing of building materials by mechanical means at high pressures, tests requiring hydraulic or electrical power, tests involving the use of considerable continuous or alternating electrical currents under different conditions on specially delicate instruments and appliances. As the plant has been provided for the school it would be injudicious to avoid making it as generally useful to the public as circumstances dictate.

It is not uncommon for archæological societies to explore distant regions, and to neglect interesting spots which are close to headquarters. The Royal Society of Antiquaries of Ireland will, on October 6, set a good example by visiting St. Patrick's, which is the older of the two cathedrals in Dublin. They will be received by the Dean. The recent alterations and additions, with the cross lately discovered, will be explained by the cathedral architect, Sir THOMAS DREW. Afterwards the adjoining Marsh's Library will be visited. The locked recesses for readers and many of the interesting books will be shown, including some annotated by Dean SWIFT. After lunch members will proceed to the Royal Hospital, Kilmalnam, erected from the design of Sir CHRISTOPHER WREN. The beautiful ceiling of the chapel, reconstructed under the direction of Mr. ROBERT COCHRANE, the honorary secretary, will be seen. There will be a quarterly meeting in the evening.

THE interest which is taken in the competition of façades in Paris is evident when we learn that no less than 105 new buildings are entered for this year. The promenades of the jurors are now in progress. The position of the buildings is suggestive of the tendency of people to move westwards. The arrondissements of Batignolles and Passy supply as many as thirty-four, or a third of the whole. Not many years have elapsed since both districts were considered to be outside Paris, and the fact that not only buildings, but imposing buildings, are now being erected suggests that to find sites it has been necessary to demolish premises which were recently built. Montmartre, which was remarkable for its shanties, is so changed, it can uphold its love of costly architecture by eleven examples. Indeed, the outlying parts of the city are most disposed to assert themselves in the competition. There is a temptation to claim notice by excess of ornament or eccentric disposition of parts, but in such a contest the respectable commonplace cannot expect to gain premiums.

ONE of the guide-posts of the history of painting is the great altar-piece which the brothers HUBERT and JOHN VAN EYCK completed for JUDOCUS VYDT in 1432. The principal part, or two central divisions, known as the *Adoration of the Lamb*, is in St. Bavo's, Ghent, and is jealously guarded, as it is found that visitors from all parts of the civilised world are willing to pay for a glimpse of it. Figures of ADAM and EVE, which originally belonged to the work, are in the gallery of Brussels. There are other wings in the Berlin Gallery. A copy was made in 1559, which occupied two years. Many efforts were made of late to produce photographs of the various sections on an uniform scale. There was little difficulty in arranging with the authorities in Berlin and Brussels. But in Ghent there was opposition. The difficulties are at last surmounted, for the concession is given to a company, and towards the close of the present year it is expected that a photographic copy about three-tenths of the size of the original work can be obtained.

WILKINS ON GOVERNMENT PATRONAGE

THE demand of Sir NORMAN LOCKYER for 24,000,000*l.* sterling in order to obtain provision for the teaching of applied science has appalled many people who believe they are already overburdened by taxation. The amount, large as it is, does not appear to be in excess of the necessities, nor would it involve national bankruptcy. In the same address there is mention of a statement by Sir JOHN BRUNNER to the effect that if 10,000,000*l.* were immediately expended in putting up buildings and endowing professors of science, the money would be repaid a hundredfold within a generation.

It is well, however, to remember that from time to time in the history of universities, which is the history of systematic education, sums have been expended or property assigned which proportionately would correspond with the amount now desired. The Mediæval university of Paris, for instance, possessed about one-half of the island in the Seine which formed the city, the other half being occupied by the inhabitants. As if it were no more than a modern cricket field, the land along the river bank, and which must at least have extended in depth to the present Boulevard Saint Germain, became the university recreation ground. When it was necessary to dispose of the meadows and gardens, it seemed to the authorities of the university the end of their establishment and the world had arrived. In other cities kings and governments were anxious to make liberal provision for the acquisition of knowledge. Nor should it be forgotten that the arts and sciences then taught were not of a kind in which the outlay was to be returned with interest in the course of one or several generations. A Mediæval university was not unlikely to produce men of the type of FRANÇOIS VILLON, who was a master of arts at Paris, and whose lives would never be profitable to themselves or their contemporaries. Instruction was supposed to be one of the duties of the State, and money was not spared on the erection of buildings and the providing of teachers.

In England individuals were, generally speaking, always more influential for such a purpose than any Government. To bishops, nobles and wealthy citizens the highest instruction obtained in Mediæval and succeeding times was due. The history of our universities affords sufficient evidence. In fact, it is only in a comparatively modern time that the English Government considered education as forming part of its responsibilities, and in consequence there is alarm at present about the cost which it will involve. The hesitation of English statesmen to grapple with the difficulty is suggested by the mode of raising funds for technical classes and public libraries. The Technical Instruction Act of 1889 euphoniously is called an "Act for the Distribution and Application of certain Duties of Customs and Excise," which means that part of the money derived from licenses for the sale of beer and spirits can be applied to the teaching of technological subjects. Public libraries cannot as a rule obtain more support than a penny in the pound, and if it were not for the munificence of Mr. CARNEGIE the Act would be a dead letter in the majority of towns.

We have lately noticed the circumstances under which the Royal Academy was founded in the eighteenth century. The Government of the time took no part in the transaction. GEORGE III. offered apartments in his palace of Somerset House for the exhibitions, and promised to meet any deficiencies which at first might arise between the expenses and the income. He was no doubt surprised when asked to pay 5,000*l.*, but one of the consequences was the appointment of a treasurer and a command that the accounts should be annually submitted to the officials of the Privy Purse. Although CHAMBERS was one of the agents in the promotion of the project, it could not be said that much was done for architecture in the early days of the Academy. The indifference to the art is suggested by the position it occupies among the discourses of REYNOLDS. The first was delivered in 1769. It was not until the close of 1786 that we find any reference to architecture, and then it was combined with poetry, painting, acting and gardening as examples of a departure from nature. In the succeeding years there was no less indifference, and WILLIAM WILKINS, one of the members, the architect of the National Gallery, was therefore justified when in 1831 he inveighed

against the English Government for the peculiar manner in which the arts were patronised, and more especially that he practised. What he wrote seventy years ago is still applicable. But as his letter, which was addressed to GODERICH—"Prosperity ROBINSON"—was only privately printed, acquaintance with it is necessarily limited.

It may be premised that WILKINS was impelled to write by personal pique and disappointment. He was not as successful in architecture as he desired. He was a Cambridge wrangler. As a travelling bachelor he was enabled to produce the folio with the sounding title "Antiquities of Magna Græcia." At the beginning of the nineteenth century there was a desire to commemorate British heroes. WILKINS might be considered fortunate that he obtained commissions for the Nelson columns in Dover and Yarmouth. The House of Commons voted 300,000*l.* for the erection of two monuments of the victories at Waterloo and at Trafalgar. A committee was appointed and artists were invited to send in designs. Then when the time was approaching for receiving them it was officially announced that the committee considered a tower would be the most appropriate form for a Waterloo monument. This signified a waste of labour for many. WILKINS had entered into the competition along with JOHN PETER DEERING, better known as GANDY, who was a member of Parliament and a high sheriff. They designed a tower 280 feet high and rather extravagant in style. It had, however, taken more than twelve months to complete, and the expenditure on models and drawings was upwards of 500*l.* In spite of defects the design was adopted, and the authorities expected to have it carried out under their direction in the usual way. The committee's report was for an unexplained reason withdrawn, and, as WILKINS said, "The nation's gratitude cooled with the indifference shown by the Administration, and those who had spared their life-blood in the attainment of a victory were saved all Europe were forgotten." It was recognised at the time that the architects would be insufficiently rewarded by the payment of the premium, but there was a influential member of the committee, a Mr. HENRY BAKER, who maintained that, as there was no pledge on the part of the Government to do more than pay the premium, wrong could be done nor judgment dreaded in carrying out the arrangement. As there always is in this country a belief that architects are created to do nothing, WILKINS and DEERING had to put up with the insignificant reward.

Another case followed. On the death of the Duke of YORK, who had been Commander-in-Chief, it was decided to erect a memorial of the Prince. A committee of subscribers was constituted, with the Duke of WELLINGTON as chairman. The first step was to obtain a competition. There was to be a very select competition, for it was confined to the architects attached to the Board of Admiralty, the Academicians and Associates of the Royal Academy, and with BENJAMIN WYATT, the architect employed by the Admiralty, as chairman. WELLINGTON probably believed that the memorial of Waterloo collapsed because too much money was spent in deliberations. Accordingly he insisted on having all the designs prepared within a month. No reason was assigned for so much haste, which, however, increased the expense, for it was necessary to employ additional draughtsmen, and, unlike the present time, there was only a limited supply of them. There was no lack of faith in WELLINGTON'S good taste. But as Sir THOMAS LAWRENCE, P.R.A., and some well-known amateur members of the committee, it was supposed he would have absolute power. In those days it was customary to suggest the kind of structure desired, and a column which would resemble that of TRAJAN in Rome, if not in decoration, was mentioned. While the designs were in progress it was announced that GEORGE IV. considered a triumphal arch at the entrance to the Horse Guards, where his late brother had officiated, would be preferable. New designs, therefore, became necessary, but as the Duke of WELLINGTON stubbornly held to his project of a column the competitors were left in perplexity. Inquiries on the subject led to inactivity. Then the Duke of the KING brought the column again into favour, and before long a model of TRAJAN'S column was sent in. How the decision was arrived at was concealed. WELLINGTON

ON was not present, but he was represented by members who had always acquiesced in his views. The successful competitor was BENJAMIN WYATT, who had wisely restricted himself to the Roman column, the duplicate of which in the Place Vendôme, Paris, had been much admired by the Duke. BENJAMIN WYATT was the son of JAMES WYATT, whose restorations of some of the cathedrals has not found approval. He was an Oxford man and had served as private secretary to the Duke in the days when he was engaged in Ireland and India. He had just completed Plesley House. Not until six weeks had elapsed was the decision made known to the other competitors, and then it was by an official note which, as WILKINS said, might have been sent to a few shoemakers who had submitted samples for trial and were desired to take them back. Here is a copy:—"General MAITLAND begs to inform Mr. WILKINS at the committee for erecting a monument to the memory of His late Royal Highness the Duke of YORK having made their selection, the drawings of Mr. WILKINS will be returned to him whenever he may send for them."

The two cases just mentioned were enough to inflame the mind of a competitor like WILKINS, who believed he was able to use his pen with effect. It was said at the time that architecture had received special favour from GEORGE IV., and WILKINS therefore resolved to demonstrate that not only was the art in common with the others regarded by His Majesty, but, moreover, that the art had neither been fostered nor cultivated, and that the formation of a school of architecture had yet to be accomplished. With that object he went back some sixty years to the time of the formation of the Royal Academy. From the Academy he said architecture derived nothing in the form of encouragement or support. The only aid obtained was from a private society, for "The Society of Dilettanti" had done more towards the acquisition of architectural knowledge by the promulgation of publications on the antiquities of Greece and Asia Minor, and by other aids accorded to the professors of architecture, than all the governments and societies of England united." The Society endeavoured to have a new bridge erected across the Thames as a private speculation, and it is believed that its project led to the construction of Westminster Bridge in 1736. They purchased a plot of ground on the south side of Cavendish Square in order to erect a repository for works of art, especially of the most celebrated ancient sculpture. The building was to be a copy of the temple at Pola. A large quantity of stone of Portland was obtained for the erection. If the project was abandoned, it was owing to an apprehension of interference with the Royal Academy. The Society of STUART and REVETT on their explorations, and expended 4,000*l.*, the interest of which should be applied in founding a travelling bourse to enable two students of the Royal Academy to study in Italy and Greece for three years. Dr. CANDLER's first mission in search of Ionian antiquities cost the Society between 2,000*l.* and 3,000*l.*, another mission with the same object cost between 600*l.* and 8,000*l.*

The Society of Dilettanti sought mainly to popularise the study of Greek architecture, and to some extent the arts also gained by the exertions of the members. The purchase of paintings and of the Elgin Marbles were due to the training of painters and sculptors, but there was no such assistance forthcoming for architects. They were to be trained at their own or their relatives' expense, when they had acquired knowledge and experience. The Government were slow in recognising them. Official architects in our time are rarely prized by their brethren, they have to depend on private practice with all its uncertainties. When WILKINS wrote his epistle to Lord ERIC in 1831 there was a different feeling. An official appointment was supposed to put a seal on a man's rank and to gain respect for him as the successor of WREN and JONES. A change which was then arranged became WILKINS's eyes a slight to English architects in general, and was lamented by him in a manner which now appears exaggerated:—

In consolidating the Board of Works with the department of Woods and Forests, the Government has abolished the appointment of three attached architects. These were the situations under Government to which architects looked

forward as the reward of a successful career in the profession. Whilst these existed there was always a stimulus to the honourable and arduous pursuit of the art, and they added considerably to the respectability of the profession. They could only be held by a few, but like the seats of the Bar, they had a very extensive influence on the character and conduct of the candidates for public employment. They might be improperly filled; so may the seats on the bench or at the bar; but to be beneficial to the nation and to the profession it was only necessary that the selection of persons should be directed by discernment and judgment. According to the plan intended to be pursued in future, the patronage of the Government will be more widely spread; the generality of the members of the profession will not object to the change, but the profession itself must necessarily be lowered in public estimation. Its effects, indeed, will be somewhat similar to those which would result from the abolition of the judges, leaving the business of the courts to be carried on by an increase of the magistracy.

It may seem to be unworthy of a noble profession, and especially in a country like England, to find a Royal Academician lamenting the reconstruction of a Government department because it involved the loss of a few appointments for architects. It should be remembered, as an excuse for WILKINS, that at the time municipal authorities were not disposed to undertake the erection of town-halls, while the war had interfered with the construction of private buildings. At the time of writing he had not constructed the National Gallery, nor St. George's Hospital, nor the Haileybury College, and he could not have anticipated that in a couple of years the Houses of Parliament would be destroyed, and that he was to be an unsuccessful and discontented competitor. Perhaps one of the reasons which made him desire the continuance of official appointments was the social rank which accompanied them. The members of the Government, he says, should set the example of paying homage to science and art by occasionally associating themselves with those who have distinguished themselves in their vocations. As to the general interest of the profession, WILKINS could have no ambitious projects. Although a university man and engaged in the enlargement of colleges, he could not imagine any necessity for a professorship of architecture in Cambridge and Oxford. The utmost he had the courage to suggest was a small pecuniary grant in order to provide models of the most approved specimens of ancient architecture, and apartments for the study and exhibition of works of architecture. Modest, however, as were the claims, it cannot be said that the Government has supplied either models or rooms.

The suggestion, although it failed to lead to the creation of an architectural museum, was advantageous to WILKINS. When he heard that the site of the king's stables at Charing Cross was to be used for buildings he proposed that it should be employed not only for architectural and academical purposes, but for galleries to exhibit the pictures then acquired to form the nucleus of a national collection. It would be more central than Buckingham Palace, which was suggested. NASH wished to have the ground used for a national gallery alone. COCKERELL would have a range of shops below and public galleries over them. WILKINS's plan was preferred to the others, but it was only partly realised.

The question remains to be asked whether out of all the millions which are likely to be expended in response to the requisitions of the followers of applied science a small fraction will be assigned to the advancement of architecture? It is true the claims for the contemplated outlay are based on the supposition that manufactured exports will be vastly increased in quantity and value. Architecture can hardly be considered as coming within the category of such productions, and is therefore likely to be ignored. It is only partially considered to be a fine art, and is no less dubiously regarded as a science. WILKINS used as an epigraph a sentence from NECKER, the French financier, which he considered applicable to his arguments:—"Learning and science repay the State with usury, the assistance which the State affords to those who profess and cultivate them." If considered broadly the influence of improved architecture, although it may be of an indirect kind on producers of industry, may not be trivial, and some architectural Academician of to-day would do well to imitate the example of WILLIAM WILKINS and to suggest how much more could be done for the art than was imagined by the designer of the National Gallery.

A DISMAL QUEST.

THACKERAY humorously suggested one of the weaknesses of archæology when describing the cathedral of Coire, in Switzerland. The building contains a statue of King LUCIUS, the founder of the church of St. Peter, Cornhill, which stood opposite the shop of Messrs. SMITH & ELDER, who published some of the author's books. The figure, with its "tight red breeches, a Roman habit, a curly brown beard, and a neat little gilt crown and sceptre," was regarded by THACKERAY with more interest than statues of personages who in a hierarchical sense were the British king's superiors. According to STOW, who ought to be an authority, LUCIUS is said by one chronicler to have been buried in London, while another asserts he was buried in Gloucester. "But, oh, these incorrect chroniclers!" exclaims THACKERAY, "when ALBAN BUTLER, and MURRAY's 'Handbook,' and the Sacristan at Coire all say LUCIUS was killed there, and I saw his tomb with my own eyes."

The efforts of archæologists are now directed not only to the revelation of antique remains which have long been concealed, but also to the scrutinising of the evidence accepted by their predecessors on which the authenticity of many objects depends. In numerous cases it is found that things and traditions which were accepted as veracious have no valid proofs to sustain them. At the present time there are apprehensions in great museums that some of the ancient treasures are of modern origin. The fears have extended to the little museum of Stratford-on-Avon that contains relics which SHAKESPEARE was not likely to have seen. But is not SHAKESPEARE himself believed by some sceptics to be only a substitute for the nameless poet who produced so many noble works? The truth is people are not circumspect in all their actions; care is rarely taken to make exact records of events, and when years pass and a new generation has to deal with the questions, then imagination is allowed to have its way and much is taken for granted which may never have existed. A striking example is just now presented in Dublin, and it affords an illustration of what too often passes for archæological and historical evidence.

Last Sunday the streets of Dublin presented one of those remarkable processions which seem to be an anachronism in the twentieth century. Trade societies, athletic clubs and the thousands of aimless people who are glad to participate in what they consider "national events" marched along a great part of the city. They were celebrating in that way the centenary of the execution of ROBERT EMMET. Thanks to the songs of THOMAS MOORE and the pathetic narrative in WASHINGTON IRVING's "Sketch Book," his name has reached the ears of people outside Ireland, and he is, perhaps, the best known of the revolutionaries who wished to co-operate with France against England. In 1798 the rebellion was quickly suppressed. But it was only for a time. The discontent again broke out in 1803. Lord KILWARDEN and a few other men were killed in one of the streets of Dublin, and then the insurgents fled. They were quickly captured, tried and condemned. EMMET made a speech in which he is reported to have declared that his epitaph was not to be written until Ireland became a nation. The next day he was hanged and after death decapitated. Some of the men who were his companions survived for many years, and the incidents of his life for some days before the outbreak were related with the utmost circumstantiality. The execution took place close to St. Catherine's Church, in Thomas Street, because it was near the scene of the murders. It was also said that his body was conveyed from the scaffold to St. Michan's Church, which is on the north side of the river, and was there interred. The ground had a reputation for preserving the bodies of the dead, and it was deemed to be a fitting place for the temporary repose of remains which one day were destined to be honoured. There happened also to be a gravestone without any inscription, and that was held to be conclusive evidence that EMMET's friends had laid it over his corpse as a memorial of his command respecting an unwritten epitaph. Thousands of people had seen the stone with their own eyes, and, like THACKERAY at Coire, were convinced it was the temporary memorial of

EMMET. It was true that MOORE in one of his songs suggested there was no stone:—

Oh! breathe not his name, let it sleep in the shade,
Where cold and unhonoured his relics are laid.
Sad, silent and dark be the tears that we shed,
As the night dew that falls on the grass o'er his head
But the night dew that falls, though in silence it weep,
Shall brighten with verdure the grave where he sleep.
And the tear that we shed, tho' in secret it rolls,
Shall long keep his memory green in our souls.

MOORE should have known all the circumstances. He was patronised and protected by EMMET in Trinity College. He contributed to the journal partly owned by EMMET. He was supposed by the university authorities to be acquainted with the plot of a rebellion. But by a strange coincidence MOORE in 1803 was appointed Registrar to the Court of Admiralty in Bermuda. The Irish people could not believe in his topographical accuracy, and a grass-covered grave was taken to be a poetic fancy.

Some of EMMET's family were implicated in the rebellion and fled to America. There they were respected and gained success as lawyers and physicians. Of their descendants, THOMAS ADDIS EMMET, has recently visited Dublin for the second time in order to discover possible where ROBERT EMMET was really buried. There was no reason why the body should be conveyed to a churchyard devoid of associations with the EMMET family. His father had been interred in the preceding year (1803) in the graveyard of St. Peter's Church, which was close to the residence of the family in Stephen's Green. According to Dr. MADDEN, whose "Lives of the United Irishmen" is supposed to be flawless, "Dr. EMMET was buried in the graveyard of St. Peter's Church, in Aungiers Street, on the right hand of the entrance, close to the wall on the north side." The inscription on the stone covering the tomb vault was also given. Dr. T. A. EMMET in 1880 visited St. Peter's, but could not discover either the vault or the covering. In July of this year, when he again went to the spot, some of the headstones which before had been out of order were ranged in order. But he was again unsuccessful.

On this last occasion there was more general sympathy with his efforts, and all possible facilities were granted for the investigation. The Archbishop of DUBLIN, his legal adviser, who is one of the Irish judges, the rector of St. Peter's and Mr. J. F. FULLER, architect of the representative Church Body, gave their aid, and to this especially Dr. EMMET expresses his gratitude. At first the churchyard was enclosed, and at an early hour the exploration commenced. In the position where the burial-place was assumed to be a vault was discovered containing four coffins. On two were plates, but they bore different surnames. After searching for five days no body was found to recall a member of the EMMET family. Another attempt was made in the vicinity, and it was less a failure. For various reasons the Doctor had been that ROBERT EMMET's body was finally placed with the remains of his father, mother, brother, sister and other relatives in the family burial place at St. Peter's; but the theory had to be abandoned.

It happened that the family of Mr. FULLER was connected to the mother of ROBERT EMMET. Like the majority of people in Dublin, he had come to the conclusion that the insurgent chief was buried in St. Michan's. As a representative of the family he had assumed the care of the supposed grave, which he had enclosed and covered with a slab bearing only the inscription, "September 20th, 1803." In other words, he was substantiating an illusion. Dr. EMMET was obliged to return to America but considered it would be a tribute to Mr. FULLER's confidence in him with the exploration in St. Michan's churchyard. When the time for excavation was arranged, the president of the College of Surgeons, Sir LAURENCE ORMSBY, attended with the intention of examining the remains. He was accompanied by the Professor of Anatomy in the college. A skull and bones were found in the grave which evidently formed part of one. But the body must have been that of an old man over 6 feet high. At the time of execution, EMMET had not reached his twenty-fifth year, according to tradition, he was short in stature. A belief was accepted by hundreds of thousands of intelligent people

during a whole century was thus dispelled in a moment by the knowledge of anatomy possessed by two surgeons.

As it was well to have the investigation completed, attention was next directed to the parish churchyard of Glasnevin, in the suburbs of Dublin, which was one of the sites that had been imagined by a few as EMMET's burial-place, and where there stood also an uninscribed stone which was concluded to have some mystery attached to it. Excavations were carried to the depth of 6 feet without meeting with any remains, and, indeed, the particular stone which was supposed to be a clue had been put in position by a former rector who found it in another place, where it could not have indicated a grave.

Dr. WHATELY, who was at one time Archbishop of Dublin, wrote a sarcastic refutation of HUME's theory about miracles, which he called "Historic Doubts respecting NAPOLEON BONAPARTE." If the certainty with which the grave of ROBERT EMMET in St. Michan's Church was accepted is taken into account and compared with the barren results, would be easy also to say that not only EMMET, but the resurrection of 1803, formed another example of an unlikelihood. History, for once, is correct. The archaeologists, one, and we include among them the multitudes of enthusiasts of a humble class, have been in fault. It was summed by them that the bodies of traitors were allowed to be removed by their friends, and hence there was nothing extraordinary in carrying off EMMET's, either to St. Michan's, or to the family vault, or to Glasnevin, or elsewhere. That the body was buried by the authorities near the scaffold or in some obscure corner where it was not likely to be identified was believed to be improbable.

The whole case becomes therefore a remarkable example of the ease with which theories are adopted, though unsupported by evidence. It is, however, only one of many instances which Ireland affords. The Stone of Destiny, which has become a necessary part of the Coronation Chair, is another case. There are few people in Ireland who accept the round towers as post-Roman structures, and the majority still believe they were erected for sun or fire worship. May we not also add that the gold ornaments lately removed from the British Museum were transferred to Dublin because it was supposed they were of Irish manufacture? But Ireland is not alone in allowing imagination to supersede logic. The people see objects with their own eyes or they hear of them, and straightway theories are constructed which are as unsubstantial as any fairy vision. But Ireland is not alone in the creation of archaeological phantasies. There are few countries in Europe where the same weak practice is not practiced; and as for America, there are more sham antiquities, more works of old masters by modern hands to be seen in the private as in the public collections than are to be found in Europe. Everywhere the love of the past which is inherent in man ministers to delusions.

THE ESSENTIALS OF SCHOOL BUILDINGS.

A REPORT was presented to the British Association on the conditions of health essential to carrying on the work of instruction in schools. The following relates to buildings:—In drawing up the following remarks upon school buildings in relation to health the sub-committee had before them the regulations issued by the Board of Education both for elementary and secondary school buildings. As these are open to all, and give a large amount of detailed instruction as to planning and fitting-up of both classes of schools, it seems better to the sub-committee to confine themselves to some general observations applicable to all classes of school buildings, avoiding as far as possible details applicable to particular classes of schools, which can be readily obtained from the regulations mentioned above.

Generally.—The plan or general scheme of the building should be arranged with a view to providing for the particular system of organisation and routine that is intended to be carried out in the school.

The main points to be kept in view are simplicity and compactness—that is to say, narrow corridors or passages are to be avoided; all parts of the building and playgrounds should be easily overlooked, so that the duties of supervision may be reduced to a minimum. There should be no buttresses or projecting parts of the building to form corners or places screened from observation.

Every part of the inside should be thoroughly well lighted. The staircases should be planned so that there is easy and direct access from every part of the building to the open air,

and so distributed that no part of the building can be cut off by fire; they should be arranged to discharge into open places of sufficient size to prevent jostling or crowding in case of two or more classes being dismissed at the same time. The general scheme must provide for rapid and orderly movements of large numbers and easy accessibility to every part of the building for the principal.

In the case of large boarding schools the residential buildings should be kept separate from the educational block; in this way each boarding-house may be placed so as to have the most favourable aspect, can be more easily isolated in case of sickness, and the air can be allowed free play all round.

The objection to arranging a school in the form of a quadrangle is that there will necessarily be a certain amount of stagnant air, and that only two sides can have a favourable aspect.

Site.—A damp or low-lying ground should be avoided—if possible a position on the top or side of a hill facing south with a gravel, sand or chalk soil, sheltered to the north and east by trees, preferably pines. Ground water should not come within about 10 or 12 feet of the surface. The advantages of a good soil, such as sand or gravel, may be entirely neutralised by an impervious layer of clay a little below the surface.

The erection of a school building upon made ground is very undesirable.

In towns care should be taken to place the school away from main or noisy thoroughfares, the neighbourhood of railways, factories or any industries causing dust and smell. A wide street with the houses on the opposite side low should be chosen, both for light and the avoidance of noise. Otherwise, unless the building can be put at least 60 feet back from the street there will be disturbance to the work. In any case the room where noise is of less importance, such as studios, laboratories, cloak-rooms, staircases, corridors and the assembly hall, should be placed on the street side, aspect having been taken into consideration. Double windows should only be allowed where there is an effective and complete independent system of ventilation. The places that the children may have to pass on the way to school should also be considered when settling the position of a school.

Aspect.—The building must be placed so that the sun has free access to every part that is in constant use. The best aspect is probably south-east; this allows the morning sun to shine into the room, while it is off before the hot part of the day. Rooms facing due west will be very hot in summer, and should if possible be only used in schools where work is not carried on in the afternoon. It is suggested that on a free site the best plan will be to place the side of the hall in which the windows are (in a school on the central hall plan) to the north-west, placing the studio at the north end and grouping the classrooms on the south and east.

Entrances.—In arranging the entrances regard should be had to the prevailing wind in order to provide shelter; there should be covered space for early comers to wait in on wet mornings. They should not open directly into the hall nor be used for cloak-rooms. A strong draught is produced when two entrances open opposite to each other with a straight corridor between. In mixed schools there must be a separate entrance for boys and girls.

Cloak-rooms must be large, airy and well lighted, and placed so that they are under easy observation from outside. They should be easily reached from the main entrances, and the doors so arranged as to allow the various forms of cloak-room drill that are customary in the elementary schools. The stands should be some distance apart with 12 inches between the pegs, of which there should be only one row, so arranged that the clothes can hang clear away from the wall and allow of the proper circulation of air. In the case of boys' schools less space will be required. The best umbrella-holders are the "turnstiles." Cloak-rooms should be warmed and special attention be paid to their ventilation. Lavatory basins should not be placed in the cloak-rooms.

Classrooms—(a) Area. The area of the floor-space to be occupied by the pupils should be not less than 18 square feet per child. (b) Lighting. The main light to be from the left, other windows being subsidiary and for the purpose of ventilation.

The transparent glass surface should be if possible one-quarter of the floor-space to allow for the dark days, and should never, even on the south side, be less than one-sixth. The sill of the window should not be more than 3 feet 6 inches from the floor, but if higher should be bevelled off.

The glass should be carried as near the ceiling as may be constructionally possible. The piers between the windows should be as narrow as possible, and splayed or bevelled off. The back row of desks must not be placed behind the last window. Transoms or heavy mullions should not be allowed even if the requisite amount of glass area is provided, as they cast shadows. The colour of the walls is important with regard to lighting. The light yellows and buffs often found and recommended are not satisfactory, yellow in particular producing fatigue and nervousness in a marked degree as compared with other colours. Some light shade of green or

grey seems on the whole the most satisfactory colour. Black-boards placed at a height within easy reach of the children should run round the walls.

Sleeping-rooms.—The most satisfactory arrangement is probably that of open dormitories containing a moderate number of beds. The cubicle system is less to be recommended, while that of having rooms for two or three should be unhesitatingly condemned. Not less than 65 square feet of floor area should be provided for each occupant.

Playground.—Every school should be provided with sufficient open space immediately round the school building for the purpose of a playground; this should in no case be less than 30 square feet per head. In the case of secondary schools this should be in addition to the playing field for regular games. Boarding schools require considerably more space than day schools.

Ventilation.—The committee while feeling to the full the enormous importance of the subject of proper ventilation in regard to the success of the school, both as to the mental and physical development of the pupils, feels some difficulty in offering any suggestions as to how a satisfactory result can be secured. Many schemes are put forward, both "mechanical" and "natural," each of which claims to secure perfect ventilation, but all of which in actual practice fall far short of their promises. The committee would, however, like to utter a word of warning with regard to certain systems that rely on the introduction of hot air both for the warming and ventilation of the rooms. Such a system may work well enough in the case of one or two large rooms, but in a school with its large number of rooms with an always varying number of occupants, the difficulty of adjusting the pressure becomes very great. The continual movement and opening of doors is also apt to interfere with the proper working of the system; in addition to this there is the breathing of the warmed air. In winter the incoming air must be raised to a considerable temperature to allow for the cooling effect of the windows, walls, &c.; and although somewhat cooled down by the time it reaches the pupils it must, it would seem, lose most of its invigorating qualities, even though it has not been heated sufficiently to burn the organic particles present. Rooms heated by hot air are apt to have an enervating and debilitating effect. In order to warm and ventilate a room by hot air only it is, of course, necessary to introduce the fresh air at the top, extracting the foul air at the bottom. This, again, is open to several objections: those sitting near the outlets are in a continuous stream of all the bad air in the room; the breathed air is brought down again past all the people in the room (as are the products of combustion if artificial light is in use); the windows can never be opened, because if they were the whole working of the system would be upset; finally, in summer, when the incoming air is cooler than that in the room, there is a tendency for the entering air to fall straight down to the outlet below. This system has undoubtedly many strong supporters, but the unsatisfactory state of things existing in many schools where it has been installed has induced the committee to urge that a good deal more experiment and experience of it is required before it can be safely recommended. On the whole, it seems that the solution is likely to be found in some plan by which the fresh air (warmed when the weather is cold so that it can be freely introduced without discomfort and maintained at a temperature of not less than 55 degs.) is brought in at a low level, the foul air being taken off at the highest point (mechanical power being used to make sure of sufficient movement) and the actual warming of the room being done by some form of direct radiation.

Sanitary.—The sanitary conveniences in boys' schools may well be placed outside the main building; but in girls' schools and where there are very young children they must be provided in the main building, but should be cut off by a properly arranged ventilating lobby. This part of the school building should be thoroughly well lighted, so as to insure its being kept properly clean. Deodorants or disinfectants should not be allowed, as they take away one certain and easy means of detecting anything wrong. To prevent unpleasantness reliance should be placed on perfect cleanliness. Frequent inspection by the principal is of the greatest importance, as when these matters are left entirely to the school-keeper it is not uncommon to find in schools otherwise splendidly equipped and managed a very undesirable state of things. In planning a school great care should be exercised as to the position of lavatories, &c. No windows in the main building should overlook the approach to them.

Lighting of Classrooms.—I A. A classroom is considered to be sufficiently lighted by daylight in all parts in which a portion of the sky is visible by the scholar; by artificial light when small type known as brilliant can be read in any part of the room at the distance of 18 inches from the normal eyes. In place of blinds a sliding screen covering only part of the window should be arranged so that sunlight may be prevented falling directly on the scholars, and that with a minimum loss of daylight. Windows should always be carried as near to the

ceiling as possible so as to secure the largest amount of sky. The height of the window-sill from the floor also requires careful consideration. It should never be so low as to cause dazzling of the scholars' eyes. The window glass should be perfectly clear without any muffling or clouding, but only on account of securing the largest amount of light, but to save the check to the eye-nerve of thwarted vision. Windows ought not to be broken up by bars where these are to be avoided, and plate-glass is preferable, where possible, being a good non-conductor. It retains the heat of the fire in the room and also takes the heat out of the sunlight entering the room. Careful attention should be paid to the distance between window area and floor space.

2 A. The correct position for a child, when sitting at a desk to write, is such that his feet may be firmly planted on the floor or foot-rest, the seat of his chair reaching forward to the knee, the back of the seat supporting both middle spine and shoulders. The front of the desk should come well over the knees and be at such a height that both arms can be laid on it easily without raising the shoulders. The slope of the desk should be about 30 degs., and this position will be found to bring the paper at about the distance of from 18 to 20 inches from the eyes of the normally proportioned child. In reading the slope of the book should be 45 deg., and this exercise should for the most part be taken sitting rather than standing in order not to dissipate nervous energy from intelligence and eyesight, and great liberty of movement must be allowed within these requirements, either when standing or sitting, to avoid strain upon the delicate nervous organism. Desks and seats must be so placed that light falls from above (disappearing light causing no shadows) or from the left. Light must be steady and not flickering, and must fall upon the work and not upon the eyes of the worker.

AN AMERICAN GARDEN ARCHITECT

ON August 31 there passed away at Waverly, Mass., a man who, says the *Engineering Record*, was a true benefactor of the people and a model citizen of a type rarely indeed in the bustling life of the present time. Frederick C. Olmsted loved nature in all her manifestations, knew her secrets as it is given to few to know them, and had the earnest habits of thought that come only to those who commune with all the wordless voices of the fields and forests. But unlike Thoreau, White and others of a similar type, he was a man among men when the call came, quick to put in practice the plans his clear intellect produced with astonishing rapidity, inspiring all about him with confidence and with energy, and sacrificing his health if need be for the attainment of a noble aim. He was a great artist, and no Americans realise better the skill that is required to paint on canvas with pigments, but on the natural landscape of trees and shrubs, gardens and lawns, roads and paths, fountains, then his memory will receive some measure of praise his ability deserved.

Mr. Olmsted was born at Hartford, Conn., on April 26, 1822. When fourteen years old his eyesight was injured by poison ivy, and private tutors were engaged for his education. But he spent most of his time in the open air for a number of years, and thus began in his youth that acquaintance with nature which was not only a delight to his sensitive spirit but the secret of his great success as a landscape architect. At 18 he took a long voyage to the East, and came back with his health renewed. He studied engineering at Yale but did not graduate, and then became a farmer at Saybrook, Conn. In 1843, when he was 21, he came to Staten Island, New York. In Andrew J. Downing's garden at Calvert Vaux he found congenial friends, and he made the acquaintance of George William Curtis, Charles A. Dana and other young literary men in New York, who recognised the vigour of the free fields and the charm of the artistic temperament. He travelled a number of times in Europe and on horseback through Europe and in the Southern States examining the works of landscape architecture, and observing with sympathetic clearness the conditions of life of the people in the fields. His accounts of these journeys will doubtless remain among the best examples of American contributions to the literature of travel. "Walks and Talks of an American Farmer in England," which first appeared in 1852, ran through many editions. His letters to the *New York Tribune* from the South had a deep influence on the feeling concerning slavery, and were reprinted in several books—"The Seaboard Slave States," "A Journey Through Texas" and "A Journey to the Black Country." Their historical value as the records kept by a man of true insight and thought is enhanced by the charm of their style.

By this time Mr. Olmsted was about thirty-four years of age. His wide travels, his successful career as a practical farmer and the cultivation of his artistic tastes by observation and study had prepared him for the great responsibility which were thrust upon him suddenly. In 1856 the city of New York bought a great tract of land in the

Manhattan Island for about 5,000,000 dollars, and called plans for its improvement. Thirty-three competitors designs, and from among them that of Olmsted & Vaux was selected. Mr. Andrew H. Green was then the president of the commission in charge of the work, and with energetic backing construction was pushed with great energy. It was a period of great financial depression, and the work gave relief to thousands who would otherwise have been dependent on charity for the bare necessities of life. "The making of even a fairly sightly park of the land acquired by the city seemed a hopeless undertaking to those who knew the district in 1857. It was a region of squatters, desolate, mean, studded with swamps, rocky, altogether unattractive. The splendid achievement of Mr. Olmsted, with the assistance of Calvert Vaux and Mr. Wrey Mould, can only be appreciated properly by people whose recollections go back to that period in the history of New York. A marvellous transformation was brought about by skill and genius in an unpromising region in the course of a very few years. When the Civil War broke out each side expected but a short struggle and inadequate preparations for the years of conflict were made. There was much scraping of lint and ringing of havelock caps and other well-meant but useless efforts. Chaos soon reigned, as can be well understood by those who recall the conditions soon after the outbreak of the relatively insignificant war with Spain. The plight of the volunteer soldiers, unused to the hardships of warfare, became appalling, the National Sanitary Commission was organised to relieve them. The work was of great scope, reaching from practically every home in the North to the long line of camps and hospitals in the South. Mr. Olmsted was interested in it from the start. His clear insight into the needs of the soldiers, his intimate knowledge of Southern conditions and his sound judgment soon made his counsel influential, and his services invaluable. He became the executive officer of the commission, throwing every particle of available energy into the great work, and by 1863 was able to hand over to his associates the management of a practically perfect relief organisation of a kind never equalled before or since. But the perfection of his details had wrecked his health, and he went to the Pacific Coast to recuperate. Even during this period of recuperation he found work to do for which Americans must always remain his debtors, for he established the system of forestry for the Yosemite and Mariposa reservations. In 1865 he returned to New York and resumed practice in landscape architecture in a partnership with Mr. Vaux and Mr. Wither. Withers which lasted for eight years. He very soon undertook a work which some competent critics considered by even greater genius than Central Park, namely, Prospect Park in Brooklyn, a demonstration of the possibility of a complete duplication of the most beautiful aspects of the growth in the heart of a great city. The formal gardens and small parks, the arrangement of little breathing-spaces for the people in the congested districts of large cities, the improvement of country estates, which make up the greater part of the work of a landscape architect, often offer problems which require the exercise of the highest grade of practical knowledge, but Prospect Park represents something higher—a deep acquaintance with nature's own art and a creative spirit which could not only reproduce but improve without one false stroke. From the close of the Prospect Park work until his retirement from active practice in 1895, Mr. Olmsted's career is practically the story of the advancement of his art or profession in his country. His personality was so strong as to make him a man in whatever enterprise he undertook, resembling his friend the late Richard M. Hunt in this respect. Indeed, he is gracefully shown in one of the most noble creations of his time, the Biltmore estate near Asheville. There, in a conspicuous place on the walls of his château, Mr. Vanderbilt hung their portraits as an acknowledgment that, as he has expressed the sentiment, these buildings and parks are theirs as much as his. Other noted works which he planned are many in the parks in and about Boston, the grounds about the hotel at Washington, including the marble terrace and the stairway, the park at Niagara Falls, the State House at Hartford and the grounds of the Columbian Exposition. A complete list of his works need not be given. Suffice it to say that it covers every part of the continent and shows a catholic taste and the broadest range of æsthetic, artistic technique. It is probable that the final judgment of his work, when rendered after time has completed its pictures—his mind conceived and an accurate estimate of his achievements can be safely drawn, will show that his best work was achieved in the largest undertakings, where the scope of his knowledge and skill found an opportunity to assign a system or style of treatment just those parts of the total scheme they were most adapted to develop. About 1878 Mr. Olmsted moved to Boston, and later to New York, and there established the offices which his sons have managed since his retirement. There he drew about him

the same class of young men who gathered about H. H. Richardson. Art for art's sake was taught in a business-like manner, if such an expression may be used, and landscape architecture had a training school unequalled anywhere because of the ability and experience of its director. In a criticism of his work which appeared in the *Century* about ten years ago, Mrs. van Rensselaer stated this very clearly as follows:—"It should not be forgotten that he had to teach himself how to do such work as this (Central Park). I do not think there are any large parks in Europe which offer such varied facilities for the refreshment and recreation of the great mass of the people as do the best of ours; and, moreover, most of the European parks which at all resemble ours are, at least in their present state, younger than Central Park. Catholicity is another distinguishing mark of Mr. Olmsted's art. Despite his preponderant love for the naturalistic style in its broadest, simplest developments, he is quick to see when the formal architectural style puts in a valid claim, and he realises that even the most naturalistic landscape work should not strive to appear actually natural, and should even incorporate distinctly formal elements when they are required for use or for the right explanation of art as art."

CROSRAGUEL ABBEY.

FOLLOWING upon the principal works which were several years ago carried out for the preservation of the ruins of the Scottish Crosraguel Abbey, situated midway between Maybole and Kirkoswald, a number of further minor works, with the same object in view, and which have been going on for some time, have now been completed. The principal preservative works comprised the roofing in of that part of the buildings which contained the dormitories above and the sacristy and chapter-house, with their fine ornamental arched ceilings below and the roofing in of the gate tower, these being the best preserved of the abbey buildings. These principal works were carried out with money supplied by Viscount Dalrymple from the surplus funds of the Ayrshire and Galloway Archaeological Association, and the supplementary works have been continued as far as the funds admitted. The work of preservation is not complete, and until funds are forthcoming from some other source it will remain incomplete. A good deal has been done in this supplementary way, however, and what has been done will serve to greatly prolong the existence of those buildings that are roofless and exposed to the weather. These additional works, as also the principal portion, have been carried out by Messrs. Milligan, builders, Ayr, under the direction of Mr. J. A. Morris, architect, F.S.A., Scot. Ayr. The abbots' tower at the south-east corner of the abbey, through which runs the small rivulet, giving the water-power for the driving of the abbey mill, a building of curiously complicated internal arrangements, is in a very dilapidated condition, and parts of the existing walls are very frail, particularly the western wall, which is like a sieve from the effects of the weather. It is a moot point how the burn came to have its course through the building, but whether it was brought there intentionally, or came there by accident, there can be little doubt that to its agency is to be attributed the disappearance of the whole of the east wall, and the greater part of the north wall. So far as possible the depredations of the burn when in flood on the foundations of the remaining walls have been counteracted. Recent excavations at the west gable of the nave outside have revealed a very fine Gothic arch filled in with masonry, in which there is a square or rectangular niche. This arch was a doorway, but why it had been filled up cannot now even be conjectured. The arch was buried deep in an accumulation of débris. The complete fragment of arch left standing over the parlour next the chapter-house has been secured against further deterioration. There is room for further preservation work, however, and if the funds were forthcoming no doubt the operations would be completed.

BOMBAY IMPROVEMENT TRUST.

THE majority of the trustees for the improvement of the city of Bombay, who at a special meeting appointed Mr. J. F. Watson, a candidate from England, as assistant engineer on 400 rs per mensem, are to be congratulated, says *Indian Engineering*, on their good sense. The opposition championed the cause of another applicant, who was presumed to possess the qualifications of an architect, and by raising the pay of his post to 600 rs. thought to obviate the necessity of sanctioning the appointment of an architect as such. Mr. Rebsch, the president, however, soon disposed of this absurdity. At present the board have under construction buildings of their own of the value of 12 lacs of rupees, and their lessees are constructing others of the total value of 30 lacs. To prevent a recurrence of accidents of the nature of that for which the builder has been committed to the sessions, the appointment of a qualified architect is imperative. The majority accepted this view, and endorsed the President's selection of Mr. Watson to be assistant engineer and nothing more.

NOTES AND COMMENTS.

A FEW years ago Sir HENRY IRVING in conjunction with Mr. DARBISHIRE, of Manchester, prepared a plan of a safe theatre, of which we gave a description. But the project of M. COQUELIN, the French comedian, goes infinitely further. He believes he has been inspired with an idea by which a theatre can be constructed which will be absolutely unflam- mable. What is more, he has consulted M. BINET, archi- tect, on the subject, who is also confident about the result. Both have brought their courage, not to the sticking-place as was advised by Lady MACBETH, but to the burning-place, for a theatre is about to be constructed at Pont-aux-Dames into which M. COQUELIN and M. BINET will enter. It will be set on fire, and the worthy pair expect to make their exit when they please as fresh and sprightly as when they entered. The details M. COQUELIN declines to explain until he has obtained his patent. He does not profess to aim at making money by his inspiration, but it is only right he should have the magic house protected. The actor is no *fumist*. He has erected a refuge for his fellow players at Pont-aux-Dames which was declared to be impossible, and who knows whether he may not have invented fire- proofing of a novel kind?

THE present town of Argos exemplifies beyond most other places the thoroughness of the destruction of which Greece was the victim. From the old descriptions it must have contained some of the noblest works of architecture outside Athens. It was also a school of sculpture, and POLYCLETES belonged to Argos. Travellers have often testified to the absence of ancient work with the exception of parts of Roman walls. On that account much interest is attached to the efforts of members of the Dutch Com- mission under the direction of Dr. VOLLGRAFF, who are at work in Argos. Some steps were lately revealed which were cut out of the rock and have a width of over 30 feet. At the foot was a large altar of stone, and it is concluded there was formerly a large building in the vicinity. The director is sanguine enough to believe that traces of the ancient Kriterion of Argos may reward the labourers.

IT is devoutly to be wished that the allegation about the modernity of the silver plate which Baron EDMOND DE ROTHSCHILD presented to the Louvre as samples of Roman work of the first century is groundless. The so-called tiara of SAITAPHARNES was in excellent condition when first presented for sale, but the vessels from Bosco Reale were in a dilapidated condition. It would be necessary to believe that a modern artist first produced them in a perfect form and, then battered them out of recognition. We cannot imagine any speculator would waste skilled labour to that extent. Nor is it likely that the credulity of amateurs, and more especially one like Baron EDMOND DE ROTHSCHILD, would be more easily imposed on by so absurd a manipulation.

THE British Consul-General reports that for years the condition of the German Portland cement industry has been most unsatisfactory, owing to the prevailing disproportion between supply and demand. The inland consump- tion is estimated at 14,500,000 casks per annum, whereas the works can produce close on 29,000,000 casks. This enormous disproportion is due to the numerous extensions and new works erected in 1895 and the following years, partly on account of the activity in the building trade, but chiefly in the expectation that the Great Midland Canal would be built. Repeated attempts to form a German cement syndicate, and to regulate the prices and the production, have proved unsuccessful. The numerous local organisations compete severely against one another. Under these circumstances very few other than the old- established works, whose brands are well known, are re- munerative. The South African war and the influence it exercised on the Transvaal gold-mining industry has also severely affected the trade, as very large consignments of cement were formerly sent to that country. German cement is practically excluded from the principal European markets by reason of prohibitive duties, and while it is exempt from

duty in Germany the import duties, including clearing expenses, per 10 tons amount to 8*l.* 10*s.* in Russia, 5*l.* 5*s.* in Austria-Hungary, 6*l.* 10*s.* in Roumania, 5*l.* in Italy, 3*l.* in Switzerland and Sweden, and 1*l.* 5*s.* in Norway. Thus only the transatlantic markets are available for the expan- sion of German cement.

IN Scotland excellent building can be executed. There are peculiarities of construction and planning, partly owing to the nearly general employment of masonry and partly to differences in social arrangements. It seems extraordinary that Scottish students in technical and other schools should have to depend on manuals prepared for English use. A thin folio entitled "Elementary Building Construction and Drawing for Scottish Students," by Mr. CHARLES GOURLAY, B.Sc., the professor of architecture and building construction in the Glasgow and West of Scotland Technical College, has been published by Messrs. BLACKIE & SON, LTD. A preference is given to Scottish customs. For instance, Glasgow bricks are about 9 inches long, about 4½ inches broad, and the width may vary from 3 to 3½ inches. In laying them it is expected to be careful in "keeping the perpends," or having vertical joints in right lines. Scottish bond is laid more quickly than English, and is cheaper. Mr. GOURLAY'S pages will be found interesting reading in English offices. The plates are produced in the style of working drawings, and there is no doubt the colouring will make the details more easily comprehended by novelists. The publishers have long since gained a reputation for printing, which this latest example supports.

ILLUSTRATIONS.

THE ROYAL VILLA AND GOLF PAVILION AT LE COQ-SUR-MER, OSTEND.

RESIDENTIAL FLATS, TUFNELL PARK.

THESE flats are built upon made ground, and consequently they were constructed upon steel girders resting on concrete piers which were carried down about 15 feet until a good foundation was found. The blocks each containing eight flats, cost about 3,500*l.* per block, not including the cost of the land. There are eight blocks. The contractors were Messrs. JOHNSON & Co., of Wandsworth Common. The original drawing was exhibited at this year's Royal Academy.

HOUSE AT WIMLEEDON.

THIS house is situate in the Raymond Road, and is built of red bricks with hanging tiles on the roof floor. The contractors were Messrs. J. & C. BOWYER, Upper Norwood. The drawing appeared in the Exhibition at the Royal Academy this year.

PROPOSED RESIDENCE, HAMPSHIRE.

THIS building was intended for a shooting-box in Hampshire. This design was also exhibited at the Royal Academy this year.

CATHEDRAL SERIES.—EXETER: WEST END OF LADY CHAPEL.

THE monument seen on the left of St. Gate's Chapel, which opens out of the lady chapel, is the tomb of WALTER BRONSCOMB, who was Bishop of Exeter from 1257-58 until 1280. He was a native of the city and of humble parentage. There was expedition in his appointment, for, according to a manuscript in the Lambeth Library, "within the short space of fifteen days he was elected bishop, admitted by the king, confirmed by the archbishop and consecrated bishop; circumstances both that period unheard of in this country." He had either reconstructed the chapel for a place of sepulture, or annual commemorative services at which fifty poor people were to be fed. He appropriated the lands of Buckerey for the purpose. The corresponding chapel of St. Mary Magdalene was also his work. The beautiful tomb was believed to belong to a later period, especially since the inscription mentions BRONSCOMB as the first bishop of the name of WALTER, and there was another WALTER who presided over the see from 1307 to 1326, with which period the character of the work would correspond.

EXETER CATHEDRAL.

By E. W. GODWIN, F.S.A.

THE late Edward Godwin had often and closely studied Exeter Cathedral while he lived in Bristol. The following exhaustive article on the building, which he contributed to an early number of *The Architect*, is likely to have more interest now in connection with the series of plates of the cathedral which are in course of publication in the present issue.

In the early days of the Gothic revival, when men roused themselves to declare war against "old fageyism," when zeal itself heard and overcame for a time the calculating, tempering, cold-blooded spirit which has ever been the bane of architecture, there was necessarily much said that we may now wish to see unsaid, much done that we would like to see blotted out.

It is the misfortune of all zeal that it tends to feverishness and excitement, and thus to a condition in which anything like inquiry is exceedingly difficult and sometimes altogether hopeless.

It was the chief misfortune that befell that particular zeal which gave life to the Gothic revival. It followed its natural unchecked, unbridled; that which should have been the strength of virtue became the weakness of vice, and instead of fighting we had excitement tyrannising.

The result of that excitement was a natural reaction, so that self is now looked upon as a doubtful good. The cause was once worth battling for with something like organisation still exists. There is still plenty of "old fageyism," though much of it is disguised in the latest fashions; but men weary: some turn the battle of life into sorry jokes, some go over to the enemy; all are ready to compromise anything and everything "for a quiet life."

Another result of the feverishness brought about by the blind zeal of the revival was the blind, unreasoning and unbounded praise lavished on all Mediæval work. Foreign objects of this wild, indiscriminating worship were our English minsters. The critic who objected to certain varieties in them, and want of rhythm, was scorned as a man, blind to the picturesque; and it is quite possible that yet in the rooky close of Cloisterham anyone who should attempt to dissect the local lion—to distinguish between good and bad—to separate the art-wheat from the art-chaff, would be taken up as a "very dreadful person."

Now my object in writing this article is undoubtedly iconoclastic; but inasmuch as I believe a true estimate of the value of the mighty works as our cathedrals can only be ascertained by selection and comparison, and that to seek for a true estimate of them (if haply it may be found) is the best reverence to pay to those who built them, and the best service we render to those who study them, I shall take my chance of all the hand-lifting and nose-upturning of a world of rhaps. Before, however, we begin to criticise, it may be well to inquire somewhat concerning the history of the cathedral of our criticism. A.D. 1050 is the first date we can start with. The actual removal of the see from Crediton to Exeter took place in that year. Like most changes it had been contemplated for some time. Leofric had made application to the king and had moreover given to the church of Exeter, about the year 1046, certain vestments and vessels, amongst which were silver chalices and "one silfrene pipe," that is, a pipe used in early times to draw the wine from the chalice, so that none of the sacred element might be accidentally spilled, a custom now, I believe, only observed by the Benedictines. Then, again, Leofric is described as a great builder of churches, and as, in his official capacity of chancellor, he was among the busy ones of his day, he would doubtless be acquainted with all the building fashions of the time. It is quite possible therefore—may we not say probable?—that he had directed a church, or at least the eastern part of one, to be prepared for him before moving to Exeter. From the evidence of the present building, I have very little doubt as to the nature of the lower portions, or foundations at least, belonging to Leofric's church, and that the towers mark the site of small churches in the Saxon church, for in the ground-plan of this cathedral one of the most important features to be noticed is the position of the towers. These are practically free of the Norman influence, and whilst we know that the Saxons built them in this manner (opposed to the Saxons in most things) opposed them in particular, and built their towers within the walls, overhanging or over the ends of the aisles. Again, in the charter of the year 1286 the sum of 2s. 3d. is charged, "in ostendendo sub archam in turre Sti. Johannis." Now, as it seems to me, is only capable of one interpretation, that before 1286 the aisles of the church flanked the altar, and that in order to open the latter and join them to the body of the building, so as to form transepts, it was

necessary to remove the walls under the Norman vaults in the towers. This necessarily implies a separation of the latter from the aisles, so that if this interpretation be right, it is clear that the towers could never have been originally designed as Norman transepts. We have, therefore, a basilican plan to start with, flanked by towers, placed similarly to those which Edmer the Singer describes as having seen at Canterbury:—"Dein sub medio longitudinis aula ipsius duæ turræ erant, prominentes ultra ecclesiæ alas." Moreover, this basilican plan is clearly traceable in the existing structure, in despite of all the mighty changes which have been made; and not alone in the mother church, but strangely preserved in almost every parish church in the diocese, we mark the tradition of this early Christian arrangement in the absence of a constructional chancel, the continuous roof, and the simple unbroken ground plan. Of Leofric's church nothing remains, unless we except the walls of the towers up to the first arcade. One may be disposed to make this exception, first, on account of the plan; and second, on account of design, which appears to change at this point. I am not inclined to regard the masonry in this case as any great criterion, for we may be sure that such a man as Leofric would take care to adopt the latest and best method of construction; besides which the walls may have been refaced. The upper stages of the towers—which, by the way, are not alike—are built chiefly in Late Norman work, with all those elongated proportions and slighter detail which were introduced during the second quarter of the twelfth century. We may, therefore, safely ascribe the general design of these towers to William Warelwast (1107-37), and refer the difference which exists to the interruption of the works caused by Stephen's siege in 1136, and the reparation and continuation of the works by Bishop Chichester, who succeeded Warelwast in 1137. Warelwast is regarded as one of the founders of the church, but his plan seems only to have been completed during the episcopate of Marshall, between 1191 and 1206 (the delay arising doubtless from the troublesome times of Stephen and the fires of 1136 and 1161). This completed plan can mean, I take it, nothing else than a nave and aisles, with the greater part of the present towers; that is to say, it was the completion westward of Leofric's church. Of this completion, the door to cloisters and the consecration crosses on the south wall of nave are probably the only remnants. Following this we have the fine tomb of Bishop Marshall, who died in 1206, and that of Bishop Simon, who died in 1224, together with some most interesting misereres, all executed within the first quarter of the thirteenth century. The lower part of the chapter-house shows a continuation of the same style, but later in detail; it evidently belongs to the second quarter of the thirteenth century, and may probably have been left unfinished by Bishop Briere at his death in 1244.

We have now arrived at what is called the Decorated style. The chapter-house at Westminster was commenced in 1250; that at Salisbury a little later. I need scarcely say that these buildings exhibit well-developed simple Geometrical tracery. In 1277, according to the bursar's account, the high altar of Merton College chapel was dedicated, and there we find the windows varying in design, exhibiting compound Geometrical tracery; that is to say, spherical triangles and other forms are used as well as circles. If we keep this in mind, and occasionally refresh our memories with the fabric rolls, the ground plan will, I think, soon convince us that the Decorated work of this cathedral—which, at first sight, seems of one style and date—is, indeed, nothing of the kind. The fabric rolls begin in 1279. Bishop Bronescomb died in 1281, and although his successor, Bishop Quivil, is generally regarded as the author of the first or earliest Decorated work, yet I cannot help thinking that the evidence is in favour of Bronescomb, and that to him we owe the idea of the present cathedral. Thus, from all we know of Bronescomb, he appears to have been a building bishop. Most Mediæval bishops worth anything had a hobby of some sort; one indulged in the chase, another in war; there were baron bishops and saint bishops, king bishops and people bishops. Bronescomb, like Poore of Salisbury, was unquestionably an architect bishop. He began by building a college; this was followed by a palace; and, finally, he turned his thoughts to his own church. The fabric rolls date from two years before his death, and begin rather abruptly, in September 1279, with an entry concerning three windows in St. James's Chapel. From this alone we might fairly argue that Bronescomb had begun to interfere with the old work before 1279; that then, having housed himself in a new palace, he provided a new field for his hobby of no less an extent than a new cathedral; and that, foreseeing the large amount of money which from time to time would be expended on the undertaking, he began to keep accounts of the same.

Now let us look at the ground plan. The first thing which ought to be noticed is the general similarity to Salisbury Cathedral, which we know was consecrated in 1258, or the very year of Bronescomb's election to the see of Exeter. Again, the side walls of the lady chapel, instead of being in line with the arcades of the main building, are considerably within

them, and the lady chapel is separated from the *via processionum*, or retro-choir, by arches having large wall-piers between them, and thus the difference of width between lady chapel and presbytery is unobservable. This alone would have led me to conclude that a plan for a new church had been prepared, and the lady chapel commenced before what I may call the Saxo-Norman church had been taken down, and that in the new plan the width of the central division of Leofric's church was retained. We have, however, corroborative evidence in the windows of the lady chapel, for it is to be noted that the simpler Geometrical forms are used in the tracery, circles and spherical triangles being there more abundant than in the other windows; and anyone who takes the trouble to look closely will also discover a change in the jointing of the masonry, a bolder expression in the sectional forms of the mouldings, &c., and in the subordination of the tracery bars; but above all is visible a strange pulsation, so to speak, of thought through Bronescomb's work, hardly to be described, but especially noticeable in the sedilia and its conventional trefoiled leaves.

All these things indicate an earlier and better description of work. It will be seen, on examination of the building, that the Decorated windows of the tower are somewhat more elaborated than the windows we have been considering. These are dated 1285, and are amongst the first works of Bishop Quivil. In 1286 the interior of the towers were metamorphosed to their present shape, and Quivil may safely be regarded as the destroyer of the rest of Leofric's work. Eastward of the towers the building shows us three distinct works:—(1) Bronescomb's work, as far as the middle of the eastern bay of the choir, where the masonry changes. This was finished at a later period by Quivil. (2) Stapledon's work, consisting of four bays of the presbytery to the middle of the third bay from the crossing, after which there is an increase in the circumference of the piers of 2 feet, narrowing the aisles 9 inches. Changes are visible in the level of the bases, the base-moulding and the vaulting of the aisles, whilst the triforium is also altered both in detail and depth of recess. Grandison was probably the author of these changes, and to him we may attribute the three bays of the choir from B westward, and, indeed, the greater part of the church westward of the towers. Leaving the Decorated work, we have very little to detain us. The east window of the presbytery is a dated example, and was put up in 1390. The upper part of the chapter-house was finished some time in the second half of the fifteenth century, although surveyed as early as 1412 and commenced in 1439. The east window "was made" by Bishop Neville, and the roof by his successor. There are one or two trivial repairs and a chantry, which are of still later date; but these are of very little consequence, either historically or architecturally.

Turning now to the architectural design, the first thing to be observed in this cathedral is the effect of conservatism. The retention of Warelwast's Norman towers has evidently exercised considerable influence on the Decorated rebuilding of the great church which stands between them—an influence which has resulted in a series of grand monotonies; whilst the Decorated building has, in its turn, produced an enormous effect upon the towers by sinking beneath the ridge of the crossing two of the most important of the tower stages, which were formerly altogether free of the church. Yet even now there is a grandeur about these towers which English towers rarely possess; much more grand must they have looked flanking the shorter and lower building, unencumbered by any of the high roofs which now butt against them. I shall not detain my readers by any criticism of the Norman towers, for they have been far too much tampered with by Quivil to enable us to give them a fair judgment. Turning from the Norman work, the first thing which arrests attention is the main roof, with its continuous ridge of more than 300 feet in length, suggestive of railway sheds and Great Exhibition buildings. It gives undue emphasis to the length of the building, and undue emphasis is always vulgar. Another great defect of the exterior is the composition of the west front. It is true that the outlines of the western façades of most of our English cathedrals are clumsily designed; in fact, they appear to have been the great stumbling-blocks of the Mediæval architects. The west end of Salisbury is nothing but a square screen and a gigantic sham. That at Wells, with its unfinished towers, is not much better; but to Bishop Grandison was reserved the unenviable distinction of being regarded as the founder of a façade second to none in sheer ugliness of form and proportion. This ugliness was produced chiefly by continuing the gable proper over the aisles, so as to hide the flying buttresses and give a vulgar, because this also gives undue emphasis to the roof line. The beauty of the tracery in the circle of the great window is certainly one redeeming feature, so far as it goes; and if we can be satisfied with hand-labour only, the elaborate portal-screen may also tend to abate censure by virtue of its lavishness. For myself, however, I am bound to acknowledge that I find very little to admire in this much bepraised façade. The composition of the masses is singularly feeble. It has no more design in it than the simplest barn-end, and consists of nothing

more than one huge gable of a breadth nearly equal to the total height, divided into three parts horizontally and vertically. (See diagram.) The vertical lines AA are formed by buttresses and pinnacles. The horizontal

lines BB are marked by cornices and battlemented parapets, the middle and upper divisions being set back a few feet within their respective parapets. One result of this is that in foreshortened front views the gable BCD drops behind the parapet BD, and the whole façade consequently becomes heavier and more dumpty in its proportions than I have shown. If we examine further, we shall see the same poverty of mind displayed in the relations of solids to voids. The three portals are quite unworthy the name; they are more like ways to chantries than the western portals to a cathedral. Their jambs and architraves are so miserably cramped that they may be said to have no constructional existence, an applies also to the whole framework of the screen, the texture of which seems to have been handed over to the mercy of some sculptor's assistant, who has made an patch of the niches and a confectionary of the battlements. This last is particularly marked in the side portions FCW, where little figures are introduced looking through the embrasures of diminutive two-storeyed merlons. There is no visible reason for one can scarcely apply such a term to the chamfer which takes its place. Indeed, the whole of the lower part of this front—in other words, the whole of the western front (commonly called the screen)—is an instance of the capriciousness of the sculptor at the expense of the architect, a capriciousness which might have been excused, only that this was not worth glorifying at any expense; those figures are not dead and lumpy being afflicted with an energy too enormous to describe.

The windows of the side aisles are altogether lost in this extravagant display, and even the great west window is far covered as to present little more than tracery, whilst the upper part of the west window is a heavy mass of almost pure masonry. It is needless to say that the contrast between the lower and middle divisions is consequently violent. The circle of the west window is in itself admirable. It is composed of an inner circle containing five spherical triangles arranged upon the intersection of two isosceles triangles. Beyond this exquisitely beautiful central figure is a ring of tracery, composed of six cusped quatrefoils and six cinque-foliate arches alternating. The design of the rest of the tracery is crushed by the upper part, and the spacing of the mullions below is crippled. The jamb and arch mouldings are almost as deficient as those of the doorways; some of the designed flowing tracery occupies the roof gable, and the toy-like on the hood moulding a figure in a pinnacle-niche gives a perpendicular line just where it is not wanted. The sins of omission are almost as grievous as those of commission; thus, had the dividing buttresses been carried up to the pinnacles above the upper parapet, and some placed on each side of the arch of the great window, these slight additions would have given some dignity to the raw and imperfect design.

In the side elevations the absurdity of the clerestory is manifest to anyone who will give two thoughts about the boldness of the buttresses and the varied tracery of the windows are well worth studying; the latter not only for their intrinsic merit, but for the suggestions which they may give, because, although in much the same style as those of the College chapel, they are mostly far from attaining their purpose, and very far from fulfilling the great problem of the tracery, viz. equality of space in the openings, and in the examples this is rendered more glaring by the lack of elevation, all the tracery bars of many of the windows being in the same plane. Before leaving the windows for which the cathedral is so celebrated, it should be noted that there are forty varieties of tracery, and of these the windows of the chapel and towers are exceptionally good.

On entering the west door the critic is silenced for a moment by one vast and almost overpowering impression of space. There are three things which above all others contribute to this impression, viz. the colour, the long vista and the proportions. These latter constitute the most important elements in designing cathedral interiors, and I shall not refer at some length to them. And first of all, I think that the great characteristic of a cathedral or minster, as distinguished from an ordinary parish church, is the division of the height into—first, the main arcade; second, the triforium; and third, the clerestory. There are all

churches which partake strongly of this character and each very nearly to the minster form, as in the case of St. Redcliffe. There are also minsters in the ecclesiastical or ritual sense which, in their architectural design, are strongly of the ordinary parish church, such as the churches of Sherborne and Wimborne, but these are buildings of the twelfth century. Of this, however, we may be sure, that the cathedral character follows in proportion to the development of the division. This appears to me the main consideration, though it must not be forgotten that the element of size and comparison of the bays by vaulting shafts have considerable influence in the minster effect of a design, but they do not seem to be absolutely essential. Now the question arises, is the degree of development which the building before us exhibits in its triple division? To answer this question it is necessary to ascertain the limits of the proportions met with in the best works of Mediæval art. To narrow the inquiry, I shall pass by all Norman buildings with the exception that, as a rule, the triforium was rarely less, and more, than one-half the height of the main arcade. With the introduction of the Pointed system, and the general tendency to increased height which it encouraged, the great vault was raised at the expense of the triforium: thus, in the choir of St. Albans and the presbytery of Worcester, the height is between 2 and $3\frac{1}{2}$ feet less than a half; at Salisbury and Lincoln choir it is reduced nearly to a third; at Westminster it is almost an exact third, and at Tintern and Chartres less than a third. From the evidence of these widely-known examples we may conclude that the proper development of the triforium is bounded by a proportion of not much more than a third, and not more than a half, the height of the main arcade. Here at Exeter the triforium space is less than half, even including the parapet of quatrefoils in front of the clerestory windows; without this, the proportion is reduced to less than a sixth. Those who are accustomed to visit the cathedrals will easily discover in this example that the character of a triforium as an architectural feature distinct and independent in itself, because uniting and reconciling the single arch below to the lighter work above, is sacrificed. I may call the big-window scheme. It is not therefore the relative proportions of these vertical divisions—main arcade, triforium and clerestory—that we must look for the use of the grand effect attained in the interior of a cathedral. We come now to another important point, and I use the word without any hesitation. At Exeter where the triforium is nearly half the height of the main arcade, and at Salisbury, where it assumes a more developed character, the vaulting shaft is reduced to a corbel, and the horizontal idea is followed—to an excess, perhaps, but an excess which is redeemed by the proportions and character of the triforium, although we lose the independent vertical divisions. Here, however, although the vaulting shafts are carried down to corbels immediately above the capitals of the great piers, there is even a greater lack of vertical effect, because of the flatness of the shafts themselves and the greater proportional breadth of the building everywhere arrests the eye. That this breadth is conducive to some grandeur is quite possible, but the result would not be seen in every respect greater had the vaulting shafts been carried down to the floor. Now if we turn to the transverse section of a cathedral we find it founded on a double square of the height of the piers being just more than half the height of the arches are wider than usual; these proportions no doubt conduce mainly to the grandeur of expression and undeniably belongs to this interior—an expression also enhanced by the large size of the clustered shafts, the grey colour of the stone and the jointing of the

work. I only call attention to the vaulting in order to obtain a fair admiring. The student will not fail to note the simplicity of its construction, the broad regularity of the ribs, the elegance of curve and boldness of detail of the ribs, and especially the opposing severity of the longitudinal and transverse ribs, and the almost equal spaced ribs of the bosses on these ribs. Before concluding, I direct attention to a few minor but interesting features: the exquisite altar tomb of Bishop Marshall, the ritual accessories to the effigy of Simon de Apulia, and the carving in the miserere. Less powerful in design and execution, but yet of considerable interest, are the bishop's pure fourteenth-century work, but said to be of the fifteenth century, the minstrels' gallery and the galleries. I have no space to treat as they deserve examples of those three great decorative arts, tile pavement, glass and mural painting, which are preserved in Exeter Cathedral. There can be no doubt that floor, roof, and wall once served as fields for colour decoration. Architects of our old cathedrals lived in the self-same way, but it was not enough for them merely to disfigure the relation of solid to solid, or to rest satisfied with the multitude of form to be eliminated from square, circle or

triangle; the triumphs of proportion and construction, and all the wealth of carving and sculpture, only made them feel more and more their deficiencies and shortcomings, and so taking courage in the very thought of their unworthiness—in the confession of their weakness—they expressed in their works all the delight they felt in the works of Him who has spread His mosaic of flowers on the earth, and has recorded His promise in endless arches of never-dying colour.

A PREHISTORIC SETTLEMENT.

A REPORT was presented at the meeting of the Cambrian Archaeological Association describing the investigation by the Rev. S. Baring-Gould and Mr. Burnard at Tre'r Ceiri. On June 29 they visited the place along with the Rev. J. Fisher and Mr. Harold Hughes, and there sketched out a plan of procedure. According to their commission, they confined their attention to the cytiau and left the fortifications to be investigated on a later occasion. The number of cytiau within the inner walls—an area of about five acres—could hardly be determined with certainty, but probably the huts numbered considerably over a hundred. The highest point of the site within this area was east, where the ground rose to 1,591 feet above sea-level and fell somewhat abruptly to a lower terrace, and then sloped gradually to the western limit of the inner wall. The highest point had a cairn-like appearance, but they believed it to be mainly natural. The extreme summit was evidently artificial. The cytiau were situated in groups on the terrace and on the slope, and also under the inner face of the walls. In the latter case each hut had a wall built against the rampart with, in some instances, a narrow intervening space. The forms and sizes of the huts were varied; some were circular or pear-shaped, and others again were oblong and rectangular. In a few instances the doors of the cytiau opened out of a small space or hall entered through a common doorway. The entrances faced various points of the compass. Occasionally the huts were double, one chamber leading into another. In a few instances an outer curved wall protected the entrance. The entrances varied in width from a little over 2 feet to 4 feet. The walls of the huts, which were very rudely built, were usually 4 feet wide, and varied in height from 3 feet to 6 feet. The subsoil of the site was a mild clay, and resting on this was a crust of peaty earth of varying depth, carrying on its surface a luxuriant growth of heather and whinberry plants. This peaty earth carried a certain amount of water which it retained, and in this it was assisted by the clay subsoil. This rendered the hut sites damp, for wherever a hole was sunk into the subsoil water accumulated in small quantities. To minimise this disadvantage the builders of the huts excavated the greater portion of the interior down to and into the subsoil, and then filled the pit with rubble and roughly paved the floor with flat stones. Sometimes the excavated portion of the hut was filled with flat stones placed vertically, and in one case regularly built drain-like cavities acted as catch-pits under the paved floor. There was no drain to carry the accumulated water out of this hut. So long as the floor was raised sufficiently above the drainage water-level, the occupants must have been satisfied. The roofs of the huts were probably of thatch, made with rushes or heather; they were certainly not of stone, for the accumulation of this material in the interiors represented wall ruin only, while the shape of the greater portion of the huts would have made a stone roof impossible. Where practicable all the huts examined were explored right down to the subsoil so as to make sure that domestic objects had not found their way between the rude paving stones down to and beyond the stone packing. It was not practicable to do this in all cases, owing to the ruined condition of the walls. Having referred to the injury done to some of the cytiau as the result of an old woman's dream, that a copper cauldron full of gold was buried in Tre'r Ceiri, Mr. Baring-Gould gave a detailed account of the thirty-two cytiau examined and of the finds made therein. In No. 1 coal only was found; in No. 3 a dozen pieces of dark pottery, some pebbles and a small fragment of pointed iron were found; in No. 4, some charcoal, two spindle whorls (one broken) and pebbles, both large and small; in No. 5 a spindle whorl, pieces of ox tooth and some charcoal; in No. 6, a combined adze and hammer of much corroded iron, a part of an iron blade, some small fragments of bone and ox teeth; in No. 7 a spindle whorl, two iron objects—one about 3 inches long, the other a crescent-shaped piece, both much corroded—and some small fragments of bone; in No. 8 a bronze triskele and a large ribbed melon-shaped broken bead of blue-glazed porcellaneous paste; in No. 10 a bronze fibula plated with gold, highly ornamented, a much-corroded iron ring, with a diameter of 2 inches, and another ribbed melon-shaped bead of blue-glazed porcellaneous paste; and in the others pieces of charcoal, fragments of red and black pottery, lumps of corroded iron, a bone comb, a few sling stones, pebbles and bits of bone. Continuing, the report

stated that the exploration lasted ten working days. Of the thirty-two huts examined twenty-three yielded charcoal or objects indicative of human occupancy, and the remaining nine were blank. The pottery found was wheel-made and late Celtic in character, excepting the tiny fragments of thin red pottery found in two of the huts. These were undoubtedly Roman. Continuing, Mr. Baring-Gould said they had come to the following conclusions:—“(1) That the fortifications were erected and occupied by that people to whom the finds appertained. There was no evidence of any further occupation, not a trace of flint tools or weapons, not a fragment of pottery of the Bronze Age, nor were there any indications, with a possible exception of the bone-comb, of a later occupation. (2) That Tre'r Ceiri was only temporarily, and that for a short time, occupied in the summer season alone; as the amount of charcoal found was remarkably small, and some of the cytiau seem not to have been occupied at all. The exposed position of Tre'r Ceiri and the excessive dampness of the site would render it impossible of occupation during winter. (3) That the race which erected the walls and constructed the huts was Celtic, probably British, and that the period to which they belonged was the first or second century of the Christian era. Our reasons for coming to this conclusion are as follows:—(a) The pottery is wheel-turned and distinctly Celtic, but along with this was found a small amount of what is certainly Roman pottery; (b) the amount of iron found proves that the tenants belonged to the Iron Age, but there was nothing in the character of the tools and weapons found to determine the precise period in that age; (c) however, the fibula is unmistakably Celtic, and resembles one found at Esica on the Roman wall; (d) the two porcelain beads are of Egyptian manufacture—one of them is the finest that had been found and recorded in the United Kingdom, and by its shape, paste and glaze reveals its origin as either Alexandria or the basin of the Nile (these must have been imported probably during, or even slightly preceding, the Roman occupation); (e) the distinguishing Celtic ornament of the fibula practically ceased or became degraded after the second century in Britain. During the first 200 years of the Roman occupation the originality and elegance of Celtic ornament influenced decoration in Britain and even in Rome, being so totally different from the stiff and conventional character of Roman ornamentation. (4) The extraordinary rudeness and clumsiness of construction of the walls and huts seemed to show that the builders had not been influenced by the Roman art of wall building, and this, in their own opinion, pointed to the erection of the fortress at an early period of the first century.” Concluding, Mr. Baring-Gould and Mr. Burnard offered some suggestions for continuing the investigations and making a thorough exploration of the fortress. They also recommended Mr. Wood, the owner of Tre'r Ceiri, to decide on some public museum, under the charge of a competent curator, where the relics found or to be found might be carefully preserved for the sake of their great importance as a contribution to the knowledge of the arts of the British at the dawn of the history of our island.

MUNICIPAL ENTERPRISE.

THERE are few municipalities in England in which the debt has not been vastly increased during recent years. It can be admitted that in many cases advantages to the inhabitants have resulted. But grave doubts have arisen about the wisdom of expenditure which must impose an onerous burden on ratepayers. One aspect of the case was suggested by a paper on “Depreciation and Sinking Funds in Municipal Undertakings,” by Mr. Stanley Horsfall Turner, M.A., which was read at the meeting of the British Association. According to him, as all municipal undertakings are started with borrowed capital which must be repaid within statutory periods, it is important to understand how this initial burden should be distributed as between the present and the future. No decisive answer has at any time been given to the question whether depreciation funds should be kept, with the result that municipalities differ very widely in their methods. A few have adequate depreciation funds, others have either inadequate ones or none at all. According to the latest returns the annual average depreciation fund for municipal tramways in England and Wales is only just over one-half of 1 per cent. on the capital borrowed, and tramways show the largest percentage of any municipal industry. It is urged by those municipalities which have no depreciation fund that the sinking fund, being based upon the life of the subject, is the depreciation fund, and that if the loan is entirely repaid when the plant is worn out or obsolete the present has done all that is necessary. Their successors must borrow to reinstate the works. The only alternative, as the law now stands, is to have a depreciation fund in addition; and if this were a true depreciation fund it would be too great a burden upon the first generation, since the life of the subject is taken into account twice over. Those

municipalities which voluntarily lay aside a full depreciation fund urge that once an undertaking is started its value should be maintained, as in a private company working an undertaking, and that the sinking fund is an extra requirement enforced by Parliament because it is deemed undesirable to allow any permanent local debt. While this second recommendation is the sounder finance for representative undertakings, there are serious objections to it so long as the sinking fund is fixed on the present principles. The first generation is burdened twice as much as the second and succeeding generations. It not only repays the whole cost but also builds up an equal capital for future generations which have no sinking fund to pay because their capital is not borrowed. The difficulty arises because the statutory provisions, which contemplated none of the recent extensions of municipal activity, are not suited to some of the present undertakings, and in these cases a depreciation fund should be obligatory, while the sinking fund should be entirely dispensed from the life of the subject.

A GERMAN TOWNS EXHIBITION AT DRESDEN.

LITTLE notice has been taken in England, by our correspondent of the *Manchester Guardian*, of the German Towns Exhibition which has been open in Dresden during the summer. The Germans take the development of their towns seriously. As in England, though to a lesser degree, the population is more and more concentrating in the towns, creating problems of administration, of health, of education which demand the attention of the best talent available. In Germany the service of the town is regarded in the highest degree honourable. There is a highly professional class who fill the higher posts, in municipalities, elected to the position, but giving their whole time to the work and receiving salaries. There are, in addition, unpaid councillors, as in England, among whom are to be found prominent business and professional men.

The object of the Dresden exhibition is to show the development of German towns at the beginning of the twentieth century to give those interested an opportunity of comparing the development of the various municipal services. The organiser was the Oberbürgermeister of Dresden, Herr Bentler, assisted by a committee which includes the chief German towns. Each department of the exhibition is under the control of a special committee of experts in that department. Invitations to exhibit were sent to all the towns, and exhibits have been sent by 128, of varying importance. Firms and companies which contract for municipal services or supplies were also offered space for exhibits and they are well represented in a special pavilion for separate buildings in the grounds. The main exhibition is divided into eight sections:—(1) Town Engineering (street construction, bridges, harbours, waterways, &c.); (2) Town Extension, Building Regulations and Housing; (3) Public Art; (4) Health, Police; (5) School Organisation, including exhibits for those beyond school age; (6) Poor Relief, Care of the Sick, Charitable Institutions; (7) Finance and Administration, including savings banks; (8) Registration and Official Papers and Appliances, Statistics and Literature. There are, in addition, three separate exhibitions—the trades exhibition (already mentioned), a gas and waterworks exhibition, and an electrical undertakings exhibition.

One cannot in a brief article deal with all the exhibits which deserve attention. I may, however, refer particularly to the sections dealing with streets and with town extension and housing. The continental mind, perhaps from the influence of military influence, seems more awake to the need for well-made streets in towns, both from considerations of safety and of public health than the English mind. From the time when Baron Haussmann drove straight lines of communication through Paris there has been an evident tendency to regard the modern need of rapid transit in a similar way. But the necessity of the street is not everything, by any means. It must be wide enough for its traffic, and possibly different widths of traffic will have to be provided for in one street. If the traffic of the town is to be preserved or increased trees must be planted, and advantage should be taken of natural slopes and perspectives. The surface should not only be able to stand the traffic, but should be capable of rapid and effective cleansing. Finally, it is along the street lines that the drainage, gas and electric-supply system run, and a well-organised municipality will arrange these so that access can be had to them without disturbing the street. Such are some of the matters which a street engineer has to consider. There are here many diagrams showing streets in plan and section, often with photographs and models. In the exhibition grounds one finds by side every possible variety of paving material, and also actual street sections to show the arrangement of the ground works. Apparently wide streets are to be the

towns. Judging from the exhibits, the whole tendency is in this direction. Separate tracks for slow traffic and for traffic, for foot passengers, for cyclists and for riders are constructed in several towns.

Other than "Haussmannising" is to foresee the growth of towns and to make provision beforehand for the streets that will be required. Perhaps nothing in the exhibition is more striking than the plans (many of which are large-scale relief maps) of the German towns, showing the streets and roads that are not yet made. The officials of the chief towns have learned from their past difficulties, and now insist that their towns shall grow on scientific principles.

The housing question is often acute in German towns. In many cases the municipalities are themselves building dwellings for the working classes, although co-operative building societies and private firms, with the assistance of public funds and under the supervision of the town councils, are the main agents in providing for the needs of the community. The building regulations are conceived in a statesmanlike way to meet different circumstances. The town areas are mapped into zones, within each of which different building by-laws apply. Thus in London there are five zones and as many sets of regulations. The zone nearest the centre of the town four-storey blocks are permitted, and these may be continuous, and in certain circumstances the whole of the plot may be covered by buildings. In the second zone the buildings may be grouped, but the plot may have more than 60 metres frontage. The number of houses allowed is three, and not more than half of the plot may be built on. In the third zone the houses must be no more than one and a half storeys; they may have three storeys, but only one-third of the plot may be built on. In the fourth zone a wider space between houses is necessary, and only one-fourth of the plot may be built on. Houses in the fifth zone must be still further apart, only one-fifth of the plot may be built on. The zones are concentric; apparently allowance has been made for the lines of growth of the town. But it will be seen that the regulations of this sort, which provide for a thinly populated "city" zone on the outskirts of the town, where land is abundant and where there is every inducement to the builder to use every available inch of his ground with buildings, do not insure the pleasantness and healthiness of the town. The principle, at least, might well receive the attention of municipal reformers.

The wide-spread interest in the exhibition, which, be it said, is practically without popular attractions, speaks well for the strength of civic feeling in Germany. The exhibition committees do what is possible to increase the interest of the towns by arranging lectures by experts in the various subjects. To-day an engineer is describing gas and water supply and a medical officer the treatment of consumptives in the exhibition-rooms this forenoon there were at least a dozen classes from the high schools, under their teachers, studying the organisation and working of the town services. Germany prepares to face the problems of town life in the twentieth century.

NATIONAL ART COLLECTIONS FUND.

It is proposed to found a Society analogous to those already existing in Paris and Berlin with the object of presenting to the nation and other works of art to the national collections. Such an organisation is needed in this country to meet the increasing competition of private collectors and institutions, both in Europe and America. A provisional committee has been formed to promote this object in the United Kingdom. A meeting will be held during the autumn, when proposals will be made, and supporters of the movement will be invited to nominate a Council and an executive committee. The scheme has received sympathetic encouragement from the heads of the national collections. Broadly speaking, the proposal is to enrol as many members as possible in an annual subscription of one guinea will be paid. Anticipated, however, that members may be willing to make donations in proportion to their interest and means, and will be from these sums that the bulk of purchases will be made. Such donations may be allocated to any of three funds:—(1) For ancient pictures and drawings, (2) for modern works of art, (3) for modern works of art. The committee will appoint purchasing committees, in whom a discretion will be vested. From time to time it may be necessary to issue appeals, inviting contributions to the acquisition of objects of unusual importance. It is hoped that the fund may become a further channel for the gifts, bequests and memorial presentations made to the national collections. The difficulties and obstacles caused through large committees having to sanction the purchase of any single work of art—which, of course, may be sold at short notice and in some foreign country—have been who are responsible for this scheme to provide that the purchasing committees shall appoint honorary buyers, to whom

the maximum of discretion will be delegated. Among those who have already expressed interest in and sympathy with the movement are the Marquis of Lansdowne, the Marquis of Londonderry, the Earl of Crawford, Viscount Peel (chairman of the trustees of the National Portrait Gallery), Viscount Knutsford (trustee of the National Portrait Gallery), Lord Windsor (First Commissioner of Works), Lord Avebury, Lord Aldenham, the Bishop of Rochester, Lord Balcarras, M.P., Sir E. J. Poynter, P.R.A., Sir J. Stirling-Maxwell, M.P., Sir L. Alma-Tadema, R.A., Sir W. B. Richmond, R.A., the Speaker of the House of Commons, Sir A. Henderson, M.P., Mr. J. Morley, M.P. (trustee of the British Museum), Mr. Bryce, M.P., Sir F. Mowatt, Sir Hubert Parry, Mr. E. W. Beckett, M.P. (treasurer *pro tem.*), Sir C. Purdon Clarke (director of the Art Museum, Victoria and Albert Museum), Mr. Lionel Cust (director of the National Portrait Gallery), Sir J. Evans (trustee of the British Museum), Lord E. Fitzmaurice, M.P. (trustee of the National Portrait Gallery), Mr. W. E. H. Lecky, Sir W. H. Tate, Sir E. Maunde Thompson, Sir E. A. Waterlow, R.A., Mr. Humphry Ward, and Mr. Isidore Spielman and Mr. R. C. Witt (hon. secretaries *pro tem.*).

SARSEN STONES.

ACCORDING to a paper read by Mr. Horace Woollaston Monckton at the British Association, the blocks of sandstone or quartzite, known as Sarsen stones, are found in many parts of the South of England. They occur at or near the surface of the ground as well as in or at the bottom of the gravels. They are usually believed to be derived from the Bagshot or Reading beds, but there does not seem to be definite evidence of the discovery of a Sarsen stone *in situ* in these or in any other formation.

Sarsens are very abundant in the neighbourhood of Bagshot. They have been observed by the author firstly, and most frequently, at the bottom of or close to the bottom of beds of gravel; secondly, and rather less often, at or near the surface of the ground where there is no gravel; and, thirdly, but only seldom, in gravel some height above the bottom of the gravel. The author has never seen a Sarsen stone *in situ*, for though he has seen many partially uncovered stones, they have in every case shown signs of wear by either water or weather. At the same time, he has noticed that the corners are frequently angular, and many of the stones have been very slightly worn and certainly not rolled by water currents or streams. The country around Bagshot is formed of the Bagshot beds, largely of Upper Bagshot beds, which are shown by their fossils to be of Lower Barton age, and the author suggests that soon after their deposition this part of England rose somewhat above sea-level, and remained as a wide, fairly level and low-lying flat covered with marsh and vegetation for a very long period. The Sarsen stones are, he believes, indurated portions of this old land surface. If this is correct it accounts for all the above-mentioned facts and also for the presence of numerous rootlet tubes in the stones, and for the absence of marine shells or of casts thereof. If after a long period of repose an elevation of the land took place, the streams would rapidly cut channels in the sandy soil and leave the indurated fragments of the old surface scattered about at various levels, and many of these would become buried in the beds of gravel, thus accounting for the presence of the Sarsen stones in the gravels. It was suggested long ago by Mr. Hudleston that the concretionary action which formed the Sarsens was due to the decomposition of vegetable matter, and a somewhat similar opinion has been expressed by the Rev. Dr. Irving.

THE PALÆOKASTRO SANCTUARY.

A PAPER on "A Pre-Mycenæan Sanctuary with Votive Terra-Cottas at Palæokastro in Eastern Crete," was read by Mr. John L. Myres, M.A., F.S.A., at the meeting of the British Association. This sanctuary, he said, stands on the summit of the hill called Petsofa, which bounds the bay of Palæokastro southward, and was excavated in April 1903. A massive retaining wall of large rudely shaped blocks encloses to south and west a roughly rectangular space, the northern face of which is bounded by a precipitous descent, and the eastern face by low ridges of natural rock. Within the enclosure were found (from the bottom upwards) (1) a layer of undisturbed soil resting on the southward shelving rock surface; (2) a layer of blackened ashy earth, apparently the remains of a large hearth or bonfire, full of whole and broken terra-cotta figurines, with painting of the Minoan (pre-Mycenæan) technique; (3) a layer of disturbed soil obliterating the ashy layer and containing fragments of its figurines; (4) over all a rubble building of early Mycenæan date, like those of the settlement site at Palæokastro, one room of which still retained its plastered and whitewashed floor, with a plastered bench round three sides, and the remains of a door. A column base from an earlier

building was found built into its foundations. The terra-cottas include figures of men and women in characteristic pre-Mycenæan costumes, analogous to that shown on the frescoes at Knossos, and completed in the case of the women by gigantic and very stylish hats, a quite new feature. Other terra-cottas represented miniature oxen, rams, goats, pigs, dogs, weasels, hedgehogs, birds, chairs, miniature vases and other objects of daily use, together with the horns and legs of a larger series of oxen the bodies of which appear to have been completely cleared away from the ash-heap from time to time. A very large number of quite plain clay balls of about the size of a marble seem to be votive like the other offerings, but are not so easily explained. They may, however, represent occasions of prayer or thanksgiving which defied the ingenuity of the modeller.

STONE CROSSES.

A PAPER on "Some Points about Crosses, chiefly Celtic," was read by Miss A. A. Bulley at the meeting of the British Association. It dealt with certain details only, and had nothing to do with the general question of origin. In considering the form of the crosses, however, regard is had to the feeling underlying the treatment, so far as this can be gathered from a general survey of the examples. Argument from form alone is necessarily imperfect, and may be fallacious, though it may suggest lines of investigation. In default of historic data, however, it is the only method possible.

1. *Celtic Crosses*.—From a survey of examples from Cornwall, Wales, the Isle of Man, Scotland and Ireland the author infers that in Celtic crosses (i.) the circle (whatever its meaning and however related eventually to the ends of the arms) is not a mere adjunct (such as a glory or a support for the arms) but is of at least equal importance with the cross. The persistence of such a form without meaning points to an earlier period when the form represented an idea of primary importance. The circle is therefore inferred to be here a root-idea. (ii.) The long-shafted or Latin type appears to be an independent development from the cross with circle and equal arms. The author does not attempt to decide whether or no this development was influenced by the introduction of the pure Latin cross from outside.

2. *Non-Celtic crosses*, on the other hand, exhibit lesser importance and weaker treatment of the circle, *e.g.*:—(a) Coptic crosses, though often enclosed in a wreath, are often without. Later the ankh symbol is confused with the cross. (b) Roman (catacomb) crosses in their earliest form are equal-armed, but the circle is optional. The long-shafted or Latin form is later, and possibly developed (in Italy) from processional use. The treatment also of these early crosses is not realistic but symbolic, whereas the course of development is never from symbolic to realistic, but the reverse. (c) Syrian crosses resemble catacomb crosses, but are even more decorative in treatment. The extant examples, however, are chiefly architectural ornaments, which may account for this. The circle is optional.

RIBCHESTER, OR BREMETTENACUM.

RIBCHESTER, on the Ribble Valley, has long been known. Roman remains, some of them exceptional in character, have been found there since the beginning of archaeological record. One object in particular, a bronze ornamental helmet, the head probably of a deity, now preserved in the British Museum, is specially noteworthy. The fame of this Roman station has been increased by an old tradition of buried treasure, which seems to have been based actually upon an event of post-Roman date, and has been shown recently by a distinguished numismatist to have probable reference to the Cuerdale hoard of Saxon coins.

Excavations made in 1898-99 have now shown, says Mr. John Garstang, that the station at Ribchester conformed with the general scheme of frontier defences of the Roman empire. It was one of a series of such fortresses in methodical arrangement which with the wall of Hadrian formed the northern frontier defences of Roman Britain against the hill tribes of the north. It is analogous in plan and constructive details with other forts of the same system and period. It is to be distinguished primarily from the camps of a moving army the disposition of which is well known from literary sources, just as the name *castellum* is different from the word *castra*. Latin historians were careful of this distinction, and it behoves English archaeologists to be equally on their guard. The Roman fort is hardly treated in contemporary literature, but its character and military organisation are now clearly defined by the results of archaeological research. This fort is to be distinguished secondarily with the class of which it is an example from the later type of Roman fortress, familiar from ruins on the south-eastern coast line, built in the fourth century to oppose the dangers which threatened the Saxon shore. These

later strongholds have external buttresses and towers generally larger and with higher walls, and exhibit types of some of the Mediæval details of fortification.

But the class of fortress to which Ribchester belongs is entirely of the earlier character, severe rectangular shielded by internal buttresses and mural towers, magnificent arched gates, a stout wall not very high, with parapet guard chambers upon its length. In large examples of this class, of which Ribchester is one, the interior was filled with stone-built barrack-rooms and stables, arranged in regular rows and streets. In the centre was the large pile which constituted the headquarters of the commander of the division who constituted the garrison. On one side was commonly a storehouse or granary, and at Ribchester (quite exceptionally) there seems to have been a temple within the walls. A sub-class of this period is found to be of smaller area, about 3 acres only—with the outer walls and *prætorium* of stone.

The inception of the idea of a series of frontier fortresses in the north was due to Agricola, but the scheme elaborated and perfected with Hadrian, and much activity in building evidenced from the inscriptions under the Antonines.

It was about this period probably that Bremetennacum was finally built. There is no definite evidence of its earliest date, but it is known that a detachment of the Sixth Legion (York) completed some building work under Calpurnius, in the middle of the second century. It was garrisoned one time by a wing of Sarmatian cavalry (auxiliaries) was connected in the military scheme by roads into the stations at Manchester (*Mancunium*) and at Wigan (to the south, with Overborough (*Galacum*) and *Ilkley* (? *Rigodunum*) to the north, and directly with the headquarters at York (*Eboracum*) by the road over the hills through Ilkley (? *Olicana*).

A GILBERTIAN PROJECT.

ACCORDING to the *Morning Post* Mr. Alfred R.A., has now completed his arrangements for an establishment at Bruges of a school for the study of the branch of the fine arts on entirely practical lines. Several reasons for choosing Bruges as the site of the school, or rather art colony, for Mr. Gilbert's scheme, wider and more comprehensive than the word "school" suggests. An ancient city of noble traditions, beautiful and with its peacefulness undisturbed by the rush and modern life, Bruges impressed Mr. Gilbert from the first as an ideal place for study. Again, it is one of the cheapest in Europe to live in, a great recommendation to the student, who is almost invariably poor, and its centrality makes it within comparatively easy reach of England, some of the chief art centres of the Continent. The school will be divided into three sections:—The elementary rudimentary drawing and modelling and still-life painting to be taught; the middle, where, besides drawing, painting and modelling from the life, the students will be called on to do daily exercises in composition, and learn the arts of etching and chasing and the making and tempering of tools; and the advanced, where they will be engaged in carrying out individually or in collaboration, some specific design. In the advanced class Mr. Gilbert proposes to obtain the assistance he may need in the execution of his own work, which will be carried on in the presence of the whole. Both male and female students will be received and will live in houses managed by the nominees of Mr. Gilbert, who himself supervise their arrangements.

Some idea of the great scale of Mr. Gilbert's plan is gathered from the fact that the group of buildings thus acquired at Bruges cover an area of 3 acres. One-third has been portioned off for the school studios, one-third for a great number of private studios, which will be at the disposal of the students on very moderate terms, and the third for the laundry, dairy, &c., of the colony of artists. Houses for the male students will be part of the town, and Mr. Gilbert can arrange for the accommodation of two hundred, who will sleep in cubicles unless they prefer a different arrangement. All will be lodged and boarded on inclusive terms, and there will be a club for the men managed by themselves on the principle of a naval mess, which will supply all additional wants. Every encouragement will be given to social as well as to the art side of the colony's life, and there will be in each common room, and it is hoped that a musical society will soon be formed among the students. There is yet another interesting feature. A permanent exhibition in a large gallery will be attached to the school, this exhibition artists of all nationalities will be invited to contribute. The whole will be, or at least Mr. Gilbert hopes to be, a self-contained colony of artists, in which the means of studying all that appertains to the

ment of a craftsman. Mr. Gilbert will have the good of all English artists in his venture, and his pupils have the privilege of working with a man who is not only the first masters in the world of his own chosen craft, but has besides an extraordinary gift of sympathy, which enables him to understand as few can how hard is the task that confronts every sincere student. Mr. George is the secretary of the new school.

TESSERÆ.

Fitzwilliam Collection, Cambridge.

The Fitzwilliam collection of paintings was bequeathed to the University of Cambridge by Richard, the seventh Earl Fitzwilliam, of the kingdom of Ireland, who died on May 4, 1816, in the seventy-first year of his age, having been born in August, 1745. There are few instances on record of amateurs so devoted to the pleasures to be derived from the study of art as Lord Fitzwilliam. This taste he seems to have inherited, with the nucleus of his collection, from his maternal grandfather, Sir M. Decker, Bart. The two gems by Peter Paul Rubens, the "Schoolmaster and Scholars" and "Portrait of a Woman," were, with the Vandervelde and several others, formerly in the possession of Sir M. Decker, whose lordship he inherited, and upon which he latterly also resided at Richmond. For the last twenty years of his life he lived in almost complete seclusion, not seeing even his most intimate friends, and absorbed in the pursuits of study and learning. His collection of engravings was unrivalled, and his library was of a princely character. His latest horror was to see a fine collection dispersed, and he lamented to those who had access to him that there was no public depository for works of art to which amateurs could bequeath their treasures. He therefore determined to leave such an one at the University of Cambridge, of which he had formerly been a member. This he accordingly carried out, bequeathing the paintings and drawings he had collected, nearly 200 in number, and, with a few exceptions, of extraordinary excellence. When the Orleans collection was offered for sale, he offered £35,000 for the whole, but three speculators, having joined in bidding £40,000, the pictures were sold to them without any intimation being given to Lord Fitzwilliam. His lordship's anger at this is described to have been beyond all bounds, he declaring he would rather have sold the collection for £25,000 than have lost the collection; nor was his vexation diminished by observing the paintings divided between three parties in the spirit of trade, while a boast was made that the division of what was conceived the best, the remainder would be sold for more than the original cost of the whole. Of the pictures offered for sale, Lord Fitzwilliam did not hesitate to select for himself, and some of the choicest of his paintings will probably be observed to have been selected from that collection. The dispersion of which seems to have still more strengthened his determination to found a gallery where choice works of art might be gathered and preserved inviolate. He accordingly made the bequest before mentioned, and added to it £100,000 South Sea annuities, the interest of which (£10,000 per annum) was to accumulate for the purpose of erecting an appropriate building.

Cyclopean Builders.

Cyclopeans are rescued by Strabo from the pages of history and placed in those of history. He gives them, in connection with the Lestrygonians, the regions of Mount Etna, in Sicily. The walls of Tirythos, in Greece, were built of Cyclopean work. Pausanias describes these walls as equally admirable with the pyramids of Egypt. All barbarous and uncultivated nations gave magnificence to their cities from their great solidity. We find it in the works of the Cyclopeans and in the Peruvian walls at the town of Tusco. Strabo gives them the epithet of "well surrounded with walls." Pausanias finds in Apollodorus that the Cyclopeans inhabited Sicily and says they lived in Greece under the reign of Jobas. Jobas is a contemporary of Bellerophon, who lived in the third century before the Trojan war. Prætus, for whom the Cyclopeans built these walls, was turned out of Argos by his enemies and went into Lybia, where he formed an alliance with Jobas, and was by him restored to his country. On his return he occupied Tirythos, and when he had fortified this city by the means of the Cyclopeans he agreed with Acrisius to reign there. The Cyclopeans whom Prætus is said to have brought from Lycia for the purpose of building the walls were seven in number. There are three species of Cyclopeans distinguished by ancient grammarians: those who built the walls of Mycenæ, those whom Homer mentions, and those spoken of by Hesiod in his "Theogonia." It is said that the Romans were very near adopting a similar system of building, and it might almost be imagined that they derived from them the idea which they acted upon to construct their roads. The irregular polygonal shape of the stones

which form the cyclopean wall prevents any perpendicular motion of the great masses, and acts, although perhaps in a less degree, in the Roman roads by preventing their being moved horizontally out of their proper place; stones of the common parallelogrammic form would be much more easily deranged. The force of the shock and the action of the stones on one another while any heavy vehicle passes over them is diminished by the number of angles which act in different directions, and these polygonal stones are still more firmly kept together by large blocks which are placed edgewise on each side, and extend throughout the whole length of the roads.

Georgian Churches.

In the period which followed Waterloo more attention was given to the condition of England and the dearth of churches was quickly realised; grants were made by Parliament for the erection of new buildings. Wordsworth described the zeal of the time in a few words, "The time is conscious of her want; through England's bounds, in rival haste, the wished for temples rise." A great many of the buildings could hardly be considered as temples or as fitting for solemnities. The defects were owing to the lax system of the Church Building Commissioners. All regard to propriety and unity of design was disregarded by them. Their sole object appears to have been directed to vary the means of acquiring a certain quantum of accommodation for the smallest sum. The surveyor-general was added to the Council, and had he been an architect by profession instead of a field-officer, might have guided the taste of the Commissioners; but he seems to have been placed there for the sole purpose of releasing the Commissioners from all responsibility on points of taste. Indeed, the appointment of that officer to the situation was a matter of some surprise, for although a committee of the House of Commons recommended that the surveyor-general should not be an architect, there could be no impropriety in the appointment of a person who had been one. The recommendation of the committee seems to have arisen from the inconvenience of appointing an architect in full practice, which was experienced in the case of James Wyatt, whose dilatory habits and extensive engagements rendered his appointment objectionable. The Commissioners limited their inquiries to the practical details of the buildings, and to this object only the attention of the architects in the surveyor-general's department was directed. The result of these measures was really most unfortunate. The selection of architects being left to local committees and country vestries gave rise to a system of cabal and jobbing that disgusted the more experienced professors of the art, who left the field open to young and unpractised competitors. It had, too, the effect of creating a number of architects who were left without employment when the casual demand for their services ceased, and it was no uncommon occurrence to find them applying to established architects for employment as drawing clerks. There were some very creditable exceptions from the general run of designs, but in the great majority the architectural characters of every age and no age at all were combined.

Early Painting.

The principles of painting comprehend those of all the other arts of design, and, indeed, of everything in which the imagination or the passions are immediately addressed through the organs of sight. In this art (the simplest in its means, and the most powerful in its effect), by the mere application of lines and colours, a flat surface is made to recede or project at the will of the artist; he fills it with the most agreeable appearances of nature, and sets before our eyes the images we hold most dear. The empire of the art extends over all space and time. It brings into view the heroes, sages and beauties of the earliest periods, the inhabitants of the most distant regions, and fixes and perpetuates the forms of those of the present day. It presents to us the heroic deeds, the remarkable events and the interesting examples of piety, patriotism and humanity of all ages; and, according to the nature of the action depicted, it fills us with innocent pleasure, excites our abhorrence of crimes, moves us to pity, or inspires us with elevated sentiments. Nor are its powers limited by actual or bodily existence; the world of imagination is all its own. It ascends the brightest heaven of invention, and selects and combines at pleasure whatever may suit its purpose. All that poets yet have feigned, or fear conceived, of uncreate or unembodied being, is subject to its grasp; and most truly may it be said to "give to airy nothing a local habitation and a name." Painting, we are told, consisted in its infancy of mere outlines, and probably for a long time very little exceeded what we now see scrawled in a nursery by children who have never been taught to draw. The next step of the art was to monochrome, or the addition of some parts within the contour; from thence it advanced to the monochrome, or paintings of one colour; and to this quickly succeeded the polychrome, or the application of various colours, performed by covering the different parts of the picture with different hues, and beyond this the art has never advanced among some nations of the East.

German Exports of Iron.

The development of the German export trade in iron and iron goods between 1900 and 1902 is especially noteworthy. During the boom the inland manufacturers were not able to satisfy the demand of the home market, and at the same time to maintain their position on the world's market. Imports rose rapidly and exports receded in proportion. With the turn of the tide the exporting industries again became anxious to export, the inland consumption having proved insufficient. The figures for German trade abroad clearly illustrate this. Imports receded step by step, as the home market no longer needed them. It is very remarkable, however, how quickly the German manufacturers succeeded in regaining their former position on the world's market, which they had abandoned of their own free-will. They were assisted, it is true, by favourable circumstances, more especially by the heavy demands from the United States. Important articles of German manufacture went to the United States in considerable quantities. The syndicates, too, came to the rescue of the iron industry; under cover of the protectionist duties the syndicates were enabled to keep up prices at home, in spite of the limited demand, whereby the several works were placed in a position to reduce their prices for the world's market and were enabled more easily to compete. The difference of prices, however, fixed by the same works for sales at home and sales abroad became so great that it produced very strong comments even in the Diet. Among all the syndicates those controlling raw material and half-finished goods proved themselves the most powerful and the hardest masters. They sold raw material and half-finished goods abroad at low prices, so that the home industries which worked off such raw materials, &c., were severely handicapped.

GENERAL.

The Newcastle-on-Tyne City Council have adopted a scheme for the improvement and extension of the river quay at a cost of 559,000*l.*, of which 246,000*l.* is for the improvement of the existing quay and 313,000*l.* for extensions. The water at the existing quay is to be deepened and the extension is to be carried out for 1,050 feet. It will provide three berths for vessels.

The Stratford-on-Avon Town Council accepted last week the tender of a local builder for the erection of a public library in Henley Street. This building, it will be remembered, has been a fruitful source of controversy in literary circles during the present year. Mr. Carnegie has made a payment on account of 1,000*l.*

The First Commissioner of H.M. Works and Public Buildings has appointed Dr. Louis Parkes to succeed the late Professor Corfield as consulting sanitary adviser to the department.

Mr. G. F. Watts, R.A., has presented to the National Portrait Gallery a portrait of the late Lord Salisbury, painted in 1884. In the case of the portraits painted by Mr. Watts for the nation the Trustees had on a previous occasion agreed to suspend their usual rule as to the expiration of ten years from the date of decease.

The Annual Valuation of the city of Glasgow for the current year is 5,423,448*l.* The estimated rental of ordinary heritages is 483,972*l.*, an increase of 130,725*l.* Railways, tramways, gas and water undertakings show an increase of over 177,000*l.* The total estimated increase of all subjects is 308,542*l.*

The Dutch Government, it is stated, is about to invite an international competition for plans for the new Palace of Peace, in connection with The Hague Tribunal, which is to be erected out of funds granted by Mr. Carnegie.

Several Members of the Royal Commission on London Traffic, including Sir David Barbour and Lord Ribblesdale, have left for America to make certain inquiries as to street railways and tramways in Boston and New York. Sir Francis Hopwood, who was to have accompanied them, is detained by pressure of official business.

The Following Appointments have been made to the position of diocesan surveyors for the diocese of Bath and Wells, in accordance with the provisions of the Ecclesiastical Dilapidations Act, 1871, for the ensuing five years:—Mr. C. R. Wainwright, of Shepton Mallet; Mr. E. M. Hippisley, of Wells, and Mr. A. B. Cottam, of Bridgwater. Messrs. Wainwright and Hippisley have held the office for many years, and Mr. Cottam succeeds Mr. Samson, who has resigned the office after holding it for twenty years.

The Court of Common Council adopted last week a design for reconstructing and lowering Southwark Bridge between 7 feet and 8 feet, and raising the level of Upper Thames Street, at the intersection with Queen Street, to a height not exceeding 3 feet (and the neighbouring streets and lanes proportionately), at an estimated cost of 350,000*l.*

Mr. Albert Toft, the sculptor, is to be invited with the Nottingham Queen Victoria Memorial concerning the kind of statue most suitable. The total of the fund available is 1,830*l.*

Messrs. Hayward & Maynard inform us that they are changing their offices from 47 Museum Street, W.C., to 122 Strand, Adelphi, W.C., thus combining the Adelphi estate (hitherto carried on at 7 John Street) with the Strand. They are, however, retaining a small office at 47 John Street for the present, where they can see clients by appointment.

The Foundation-stone of the new science building in connection with the King Edward VI. Grammar School, Louth, which are being erected in the lodge field, is laid. The total cost of the building, of which the contract is secured by Messrs. Mawer Bros., of Louth and Lincoln, is 1,500*l.* The architect is Mr. E. E. Bentley, of Luton and Grimsby.

Mr. F. W. Pomeroy, the sculptor, has been commissioned by the Scottish Associations of New South Wales to erect a bronze statue of Robert Burns for erection in this domain on a site to be given by the State Government. The statue will be mounted on a pedestal of granite and on the sides will be depicted scenes from the poet's works. It is expected that the monument will be finished and set up before the end of next year.

The Sites and Schools building committee of the Louth City Council have submitted a return of new school buildings and alterations to existing municipal schools, which are the result of schemes approved by the late School Board. The schemes are in various stages of progress, although in four cases has building commenced. The total estimated cost is 192,350*l.*

A New Methodist church was opened last week at Louth. The estimated cost is 3,600*l.* The edifice is of brick with stone dressings, and a large carved stone pediment surmounts the front gable. The accommodation is for 1,000 worshippers, 311 on the ground floor and 270 in the gallery, which occupies three sides of the building. In addition to the church, there are vestries for the choir and minister, and a large band-room under the organ recess. The cost of the work was Messrs. W. J. Morley & Son, of Braintree.

M. Emile Troncy, the French painter, has been commissioned by the Municipal Council to undertake the decoration of the new theatre in Cette, of which town he is a native. Some of his paintings have been purchased by the Government.

A Prehistoric Cemetery has been discovered at Louth, in Belgium, near the frontiers of Holland. About 100 funeral urns, besides objects in bronze and silex were found in it.

Dr. Hermann Board, architect, has received the appointment of conservator of the collections and libraries of the Academy of Art in Düsseldorf.

The Exhibition of the Sheffield Society of Architects opened on Wednesday and will close on November 20.

An Excursion of members of the Devon and Exeter Architectural Society is arranged for to-morrow. Dartmouth will be visited, and Mr. Aston Webb, R.A., will show the plans of the new Naval College buildings.

The Secretary of State for India is prepared to receive applications (by letter only) for six appointments of engineers for service in India during a period of five years. Applicants must not be under twenty-three or over twenty-eight years of age on October 1, 1903, and must have passed with credit through a three years' course of training in a recognised engineering college, and must have had at least two years' experience in practical work. Forms of application are furnished by the secretary, Public Department, India Office, London, and should be returned with full particulars to training and practical experience not later than October 1, 1903. Selected candidates only are required to submit certificates of age, character and diplomas or degrees.

Arrangements have been made with the directors of the International Fire Exhibition, Earl's Court, for members of the British Fire Prevention Committee to visit the exhibition, also the historical pageant and modern fire service exhibition known as "Fighting the Flames" on the afternoon and evening of Wednesday, October 7.

Two Brothers, Biscayan painters, who went to Spain in order to paint studies after the monuments have been arrested by the police as spies.

M. Alfred Rebouveau, a well-known Parisian, who recently has bequeathed 100,000 francs in his will to the Académie des Beaux-Arts for the purposes of excavation by the French school at the site of the ancient city of Carthage, has bequeathed 10,000 francs to the Society of Painters and Sculptors, and 10,000 francs for the Orphanage of the Arts.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

RIGHTON.—Nov. 9.—Designs are invited for a new school. Premiums of 50l., 30l. and 20l. will be paid to the second and third premiated designs respectively. Particulars up to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. Secy., Brighton and Hove Hospital for Women, 76 West Street, Brighton.

DUBLIN.—Sept. 30.—Designs and specifications wanted for men's cottages, semi-detached or terraces, each cottage to exceed £100. The successful plan to become the property of the company on payment of £20. Mr. Francis B. O'Connell, Great Southern and Western Railway, Kingsbridge Road, Dublin.

FOLKSTONE.—Oct. 7.—For sewage disposal of the village of Folkestone. Report, plan and estimate of probable cost. Premium 30 guineas. Further particulars, Mr. R. Lonergan, Folkestone Place, Folkestone.

CASHEL.—Designs are desired by the subscribers to the Dean Kinane Memorial Fund for an ornamental drinking fountain, to cost about 100l. (with suitable inscription). Plans, &c., will be received by Mr. A. P. Spain, hon. Secy., Town Hall, Cashel.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75l. for design placed first, and one of 25l. for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100l., 50l. and 30l. respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SHEPTON MALLET.—Oct. 15.—For the erection of a hall to be used as drill hall and for musical purposes, cost not to exceed £1,200. Plan of site and copy of conditions on payment of £1 1s., which will be returned, from Mr. H. Charles Budd, 12 Commercial Road, Shepton Mallet.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100l., 50l. and 25l. will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20l., 10l. and 5l. will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

CONTRACTS OPEN.

BIRMINGHAM.—Oct. 5.—For the erection of a police-station in Bloomsbury Street. Mr. John Price, city surveyor, Council House, Birmingham.

BOOTLE.—Sept. 30.—For the extension of present boiler-house at the electric-light station, Pine Grove. Mr. J. Henry Farmer, town clerk, Town Hall, Bootle, Lancs.

BRADFORD.—Oct. 1.—For the erection of office, store, shed, &c., at Gouthwaite Lodge, near Pateley Bridge. Mr. James Watson, Town Hall, Bradford.

BRIDLINGTON.—Oct. 3.—For the erection of a shelter round the bandstand on the Prince's Parade. Mr. E. R. Matthews, borough surveyor, Town Hall, Bridlington.

CAIRO.—Feb. 1, 1904.—For the construction of three bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CLACTON-ON-SEA.—For the erection of detached residence in Clacton-on-Sea. Mr. George Gardiner, architect, 111 Marine Parade, Clacton-on-Sea.

CREWE.—Oct. 3.—For plastering the walls of the mortuary chapels at the Crewe cemetery. Mr. G. Eaton-Shore, borough surveyor, Crewe.

EXETER.—Oct. 2.—For the erection of a pair of cottages at East Woodley farm, Newton St Cyres. Messrs. Ellis, Son & Bowden, surveyors, Bedford Chambers, Exeter.

FULHAM.—Oct. 7.—For the erection of two lodges, with refreshment-rooms, lavatories, &c., attached, situate in the South Park, Fulham. Mr. Francis Wood, engineer, Town Hall, Fulham, S.W.

GOOLE.—Oct. 3.—For the erection of a public library in Carlisle Street, Goole. Mr. H. B. Thorp, architect, Aire Street, Goole.

LIVERPOOL TO LLANDUDNO.

ACCORDING to the *Liverpool Courier*, it is proposed to construct a light railway from the railway terminus at West in across the Dee to Rhyl, Colwyn and Llandudno, bringing the latter resort within an easy hour's journey of Liverpool and thus reducing the distance from a chronological point of view by more than one-half. The proposal will involve the construction of a span bridge over the Dee between five and six miles in length, and the intention is to carry it straight from the Cheshire side over the Tanskey Rocks or Little Barningham, joining Flintshire between Mostyn and the Point of Amlwch at the South Sluice. The route will then proceed along the side of the road through the centres named, and the locomotion will be by electricity throughout.

The project is by no means in the inception stage. The engineering side of the undertaking is one of no ordinary responsibility or difficulty, but it has been entrusted to C. H. Davison, of London, who has recently been out to Africa to report on engineering matters for the Government. The scheme will, of course, involve a large expenditure, and it is understood that so far as the money is concerned a well-known London financial house has taken the proposal up. The matter of the bridge construction across the Dee, and the Liverpool firm of engineers will probably be asked to make arrangements, and it is to be hoped that powers will be obtained by Parliamentary Bill possibly in the ensuing session.

TRADE NOTES.
India Office have decided to strip the present puttying off the large iron roof over the inner courtyard at the India Office and replace same with Helliwell's & Co.'s, Ltd., "Perfection" system of glazing without putty, are carrying out the work at the present time.
WITH characteristic thoroughness and determination to give realism, the Drury Lane management have spared no pains to insure that the incidents of the new autumn production, "The Flood Tide," shall take place in attractive and appropriate surroundings. The saloon deck of the home-going steamer has been made tasteful in satinwood and comfortable with richly tapestried couches; the Hôtel Métropole at Brighton is luxurious in Indian red plush with quaint smoking tables; the house in Mayfair is in old oak with handsome draperies and decorative details in Benares ware, and the room in The Angler's Rest is snug in old red oak—all of which were supplied by Messrs Oetzmann & Co., of Hampstead Road, W.

CATHEDRAL SERIES.—EXETER: WEST END OF LADY CHAPEL.

THE importance of a good and entirely reliable saw guard is too obvious for special remark to be necessary. Statistics prove that the rate of accidents with circular saws has much decreased during the last four years, and persons formerly very prejudiced against saw guards now freely admit that saws are best guarded, and those who have adopted "best" guards have saved the few shillings difference in price scores of times over in extra convenience and efficiency, apart from the saving of lives and limbs made more certain by really efficient guards. The highest-class design, workmanship and materials are put into the new patent "Ideal" saw guards manufactured by Messrs. M. Glover & Co., of Leeds. It is claimed that these guards give greater protection than any other guard for the following amongst other solid reasons:—1. By means of the special construction the sliding hood protects the front of the saw as far down as the wood being sawn will allow, thus saving hands and fingers which slip when pushing the wood. 2. The sliding hood protects the sides of the teeth of the saw as well as the tops. 3. The angle section of the hood makes it very rigid every way. 4. There is nothing liable to shake off or be affected by the constant vibration, which are points of positive danger in some other guards. 5. This patent guard possesses mechanical and accurate means whereby smaller or larger saws can be perfectly protected in less time than the saws themselves can be changed; hence the danger of a badly-fitting guard is obviated.

ELECTRIC NOTES.
THE contract for electric-light and power wiring at Queen Anne's Chambers, Westminster, has been placed with the British Electric and Telephone Company. These buildings which, when completed, will be one of the largest blocks of offices in the world, occupy the greater portion of the site

bounded by Broadway, Tothill Street, New Tothill Street and Dacre Street, Westminster. The electric passenger elevators are being erected by Messrs. Waygood & Otis. This work is being carried out to the specification, and under the direction of Mr. B. H. Rolfe, M.A., consulting engineer to Messrs. Rolfe & Matthews, of 3 Adelaide Street, W.C.

A PARTY of members of the Civil and Mechanical Engineers' Society visited the Council's temporary generating station at Loughborough Junction on Saturday afternoon, and inspected with interest the up-to-date machinery there laid down. The station supplies about nineteen miles of tramways with electric power, the current, generated at a voltage of 625, being taken by feeders to three substations at Clapham, Brixton and the Elephant and Castle, where it is connected with the line. A switchboard, whereby the power can be cut off from any of the substations, meters showing the consumption at each, and cranes capable of lifting twenty-five tons each were among the apparatus which attracted attention. Mr. Miller and Mr. Sonnenein, of Dr. Kennedy's staff, and Mr. McCartie, of Messrs. Ferranti (Ltd.), were in attendance, and rendered all the assistance in their power to the visitors.

VARIETIES.

WE regret to announce the death of Mr. George Alexander Dick, chairman and managing director of the Delta Metal Company, Ltd.

THE Jubilee Primitive Methodist chapel at Burnley is practically completed. The new buildings, for they comprise chapel and school premises, will cost 4,500*l.*, but eventually the school is to be enlarged, and a manse and a caretaker's house erected at an additional cost of something like 2,000*l.*

THE next examination for certificates of qualification for appointment of sanitary inspector or inspector of nuisances under section 108.(2)(d) of the Public Health (London) Act, 1891, will be held in London on Tuesday, January 19, 1904, and the four following days. Particulars will be forwarded on application to the honorary secretary, Wm. R. E. Coles, 1 Adelaide Buildings, London Bridge, London, E.C.

THE inauguration took place on Wednesday of a new school which has been built in connection with the circuit work of George Primitive Methodist chapel, Chester, in Hamilton Street, Hoole. The new buildings comprise a large classroom, seven smaller classrooms and minister's vestry. These form

but the initial part of a more ambitious scheme, which embraced the erection of a new chapel on an adjoining site. The project now opened cost 1,750*l.*, but the total expense when the work is completed will be about 4,000*l.*

IN a small Russian village where a post-office had just been erected it was felt that a lightning-conductor would be a useful addition, and accordingly a request that one be provided was forwarded to the departmental headquarters. There was a long interval of waiting, during which the letter went the rounds of the various departments, and finally a notice was sent to the village postmaster asking him to state, with regard to the request for a lightning-conductor, how often lightning had done any damage in the neighbourhood during the preceding five years, and furthermore how close and how often in the vicinity of the post office.

CONSIDERABLE wilful damage has recently been done to the ancient parish church of Hillesden, Bucks. A portion of the masonry has been deliberately knocked off a buttress by the side of the tower, leaving an unsightly projection, while on the south doorway a chisel has been used to disfigure the inserted sun-dial. The most serious damage, however, has been done to a delicately-wrought niche at the principal entrance, of which a large piece has been broken off. Missing pieces have been found lying in the hedge surrounding the church. Steps are being taken to discover the perpetrators of the mischief.

THE opening lecture of the senior architecture class in Glasgow and West of Scotland Technical College was delivered on Tuesday evening by Professor Gourlay, the subject being "The Christian Churches of Athens." The lecturer began by referring to the way in which the Parthenon and other temples were altered to serve as Christian churches. He divided the churches erected by the Christians into Byzantine style into three distinct types—(1) Those possessing a large central dome, as may be seen in the church of St. Nicodemus; (2) those having a small dome at the crossing of the four arms of the Greek cross, as in the Cathedral or Metropolis; and (3) those with the basilica or western type of plan, as in St. Mary's of the Great Monastery. The names of the various parts of a Greek church with their uses to which they were put were explained. Finally the methods of building used in the churches of Athens, with the architectural results obtained, were studied. The lecture was illustrated by means of photos collected and by sketches drawn by the lecturer while on a recent visit to Athens.

BUILDING AND BUILDERS.

A reference to the proposed new technical school for Liverpool, which is to be erected on the Raikes Hall estate, and has been paid for, competitive designs have been submitted and the prize awarded.

THE foundation-stone has been laid of the new chancel which is being built in connection with the old parish church of Westerton. The new chancel will extend 14 feet eastwards from the present one, and will be extended westwards up to the old chancel. The alterations also include the refurnishing of the chancel with oak screens and stalls. The cost will be £1,000.

THE work of erecting the King's Sanatorium at Midhurst commenced last week, a large gang of men being employed on the foundations of the building. The various portions of the work have been let to different contractors. Sir John Aird, of London, is possible for the water supply and road-making, and Messrs. Longley, of Horsham, have secured the contract for the foundations. The contract for the superstructure has not yet been placed.

THE Stourbridge Board of Guardians' meeting on the 18th inst. tenders were received for the erection of a new workhouse on the site of the old workhouse at Wordsley, and for the erection of cottage homes at Norton. The tenders for the workhouse ranged from £123,000 to £95,500, and that of Mr. J. Mans, of Nottingham, for the last-named sum, was accepted. The cottage homes the tender of Mr. Griffiths, of Lye, for £10,000 was accepted.

ON Monday afternoon, while some workmen were engaged on the rebuilding of the premises of Messrs. Tonks, Ltd., 15, Ley Street, Birmingham, a scaffolding 35 feet high gave way, and two bricklayers' labourers, named Fred Branscomb, of Spring Lane, Acock's Green, and Anthony Claridge, of St. Martin's, 3 house, Upper Trinity Street, Birmingham, fell to their deaths. Both men were seriously injured. They were removed to the Queen's Hospital and detained.

WORK at Stockhaven Harbour was resumed this week after having been stopped for nearly twelve months. The cause of the stoppage was a dispute between the contractor and the harbour trustees, which is now before the Court of Session. Some time ago the trustees terminated the contract, and at a meeting last week they resolved to proceed with the work themselves under the superintendence of Mr. Barron, C.E., the

engineer, Mr. Law being re-engaged as clerk of works. As several years have elapsed since the harbour extension was commenced, the hope is felt that no further delay will take place.

SIR A. M. RENDEL met a joint committee of Kirkcaldy Town Council and Harbour Commission on the 17th inst. regarding the proposed harbour extension, and produced plans showing the existing harbour and wet dock converted into one large wet dock and an outer harbour, six acres in extent, with detached breakwater 500 feet long, for summer steamers and trade in good weather. The total cost he estimated at £100,000. The engineer was authorised to prepare a written report on the scheme, plans to be distributed amongst the members before next meeting for discussion in time for obtaining Parliamentary powers.

THE Dover Harbour Board's proposals for the accommodation of the Transatlantic traffic have been put before the Dover Corporation by Sir William Crundall, acting chairman, pending the appointment of the new Lord Warden of the Cinque Ports. Previous to the building of the marine station the Board have arranged to connect the Prince of Wales Pier with the railway system by a line carried across the docks and over a bridge to the harbour station. They have arranged with the Board of Trade and they now ask for the consent of the Corporation. Contracts have been invited, returnable in a fortnight, and the line can be built in time to meet the requirements of the Hamburg-American service next July. At the same time railways are to be constructed round the docks, Parliamentary sanction having been granted last Session. The Corporation have favourably received the scheme.

AT last week's meeting of the Buxton Urban District Council the gas and water committee recommended the acceptance of the tender of Messrs. Fisher & Le Fanu, of Belfast, for £101,500 for constructing the new Stanley Moor Reservoir, subject to certain alterations in the schedule as the engineers may think fit. Mr. Hulme proposed, and Mr. Garlick seconded, the adoption of the report. Mr. Smithurst protested against a town with a population of 10,000 spending £100,000 on water. He said the Council had listened too much to interested parties rather than exercise their own common sense. The scheme altogether would cost £140,000, and a town of 10,000 population was not justified in spending it. The report was adopted, all except Mr. Smithurst voting in its favour.

THE Linlithgow Town Council have had submitted to them a report by Messrs. Warren & Stuart, Glasgow, to the effect

that what is known as the division in the tank at the sewage-disposal works connected with the new drainage system has proved not to be watertight, and that the subsoil water has burst open the floor of the tank. The engineers recommend the laying of a drain to carry off this water at a cost of 367, and that this expense should be borne by the Town Council. A special meeting having been called to consider the matter, it was resolved to inform the engineers that the Council declined to accept responsibility in regard to the steps to be taken to make the tank watertight, and that they looked to the engineers to see that the work was repaired and properly executed before being taken off the hands of the contractor.

SIR ROWAND ANDERSON, LL.D., has prepared designs for the reconstruction of Dundee College buildings on a definite plan and in order to secure that the space available shall be utilised to the best possible advantage. According to the design prepared the new building will be almost coextensive in length with the frontage of the present buildings, and it has been planned to accommodate the departments of zoology, botany, geology, mathematics, law and all the subjects of the arts curriculum, including languages, philosophy, history and education. It will contain also a library, a museum, a hall and the necessary administrative offices. The total cost is estimated by the architect at 85,000, but provision has been made for undertaking the work in three sections, beginning at the western end, where the conditions of the existing buildings are at present the most unsatisfactory. The hall, library and offices will occupy the central portion, and the biological sciences will eventually be accommodated in the eastern wing.

THE memorial-stone was laid on Saturday of the new church of St. Barnabas at Bitterne Park, Southampton. The church is of very simple plan, it being a parallelogram divided into three parts by two arcades. Its length is 115 feet and width 51 feet in the clear of the walls. There is no chancel arch, but the nave arcade is continued one bay beyond the dwarf stone wall dividing the chancel from the nave, the sanctuary extending some 12 feet further east. The church is entered from a porch in Lodge Road, and from Rose Road by a doorway on the north aisle. It contains seating accommodation for 600 worshippers and a choir for about thirty, good organ chamber, small morning chapel and vestry, and in the basement there is a large heating chamber and storage space. Each of the entrances will have draught lobby, and at the west end three arched recesses have been formed between the projections of the west buttresses and under the sill of the west

window, the central opening or recess being intended to receive the font. The interior is of a very simple character. It is well lighted from aisle and clerestory windows, and in addition there are two larger five-light windows to the east and west ends. The roofs are open and boarded and left to the plane, and the walls are plastered, with stone dressings to the reveals and windows, arcades, &c. The glazing is with tinted cathedral glass in pale tints, being mostly in simple squares, a little ornamental work, however, being introduced into the tracery of the window heads. The exterior of the church is faced with coursed Swanage rubble, with the dressings to quoins, &c., in soft stone, and the roofs are tiled with a dark colour red tile. The church is rather severe in outline, the flèche it was intended to have, turret and other features at first contemplated, and which would have broken the sky-line, having been omitted from motives of economy. The architectural character of the church may be described as Gothic of a late period. The seats will be of oak on a wide block floor and the choir stalls and other chancel fittings will also be of oak. The heating will be by hot-water pipes and radiators and the lighting by electricity. Messrs Jenkins are the builders, and the architects are Messrs. W. H. Mitchell Son & Gutteridge, of Portland Street.

GLASGOW SEWAGE WORKS.

THE annual inspection of the Western District Sewage Works now in course of construction by the Corporation of Glasgow took place on the 15th inst. On the invitation of the Lord Provost the chairman and the committee on sewage disposal about one hundred gentlemen comprising members of the Glasgow Corporation and other public bodies interested in the undertaking, met in the City Chambers at 11 o'clock, and twenty-four carriages proceeded to visit the works.

The drainage scheme for the city embraces three sections each distinct from the others and with separate works for the disposal of the sewage. The first of these, authorised in 1896 and doubled in extent in 1901, comprises about eleven square miles, one-half being within the city and the remainder in the landward district of the county of Lanark. The works for the treatment and disposal of the sewage of this area are situated at Dalmarnock, and the drainage is collected and conveyed there by a main sewer constructed at the cost of the Caledonian Railway Company. The second section was authorised in 1896, and includes

al area on the north side of the river not provided for the burghs of Partick and Clydebank and intervening the counties of Renfrew and Dumbarton, the whole being 14 square miles. The works for the disposal of sewage derived from this area are situated on the river at Dalmuir, about 7 miles below Glasgow. The third authorised in 1898, comprises the whole of the al area on the south bank of the river, the burghs of Partick, Pollokshaws, Kinning Park and Govan, as well as residential and rural districts in the counties of Lanark and Renfrew. The extent of this section is 14 square miles, may be enlarged by the inclusion of the burghs of Partick and Renfrew. The works for the disposal of the sewage of this area will be situated on the river bank at Braehead, about one mile eastward from Renfrew.

The principal features of the western scheme, which was authorised yesterday, are the construction of an outfall sewer to the drainage of the higher levels of Glasgow and to the works at Dalmuir; the construction of an intercepting sewer to collect the drainage of the lower levels of the city of Glasgow; the construction of an intercepting sewer to collect the sewage of the lower levels of the burgh of Partick, and a further intercepting sewer to convey to the Dalmuir works the sewage of the burgh of Clydebank. The levels of the Partick intercepting sewer are sufficiently depressed to collect the drainage of the upper district of Renfrewshire, to the west of Glasgow and Partick and to the east of Glasgow, and negotiations are in progress for adjusting the levels, and the inclusion, in accordance with the provisions of the Sewage Acts, of that territory within the main drainage system.

The Glasgow and Partick intercepting sewers will be pumped into the outfall sewer at Partick Bridge, the lift being 37 feet. The pumping engines, three in number, will be of the triple-expansion inverted marine type, with pumps, each capable of raising 11,250 gallons of water, or 16 million gallons per day. Steam is supplied to the engines by four boilers, working at a pressure of 100 lb. per square inch. The Clydebank intercepting sewer will be pumped at Dalmuir, the lift being 21 feet. The smaller intercepting sewer at Dalmuir will be of the centrifugal type, and power will be transmitted by electricity. The whole contents of the outfall sewer will be delivered into the precipitation tanks above tidal level. The purified

effluent from the tanks will pass by gravitation over a discharge weir into the river, and the sludge will be pumped into specially constructed barges and conveyed to sea. After careful deliberation and much patient investigation, it was resolved to adopt at Dalmuir the same method of sewage treatment as that which has for the last seven years been in successful use at Dalmarnock, with this exception that the sludge presses, which by the compulsion of the situation of Dalmarnock works have been employed there, are to be dispensed with, and the liquid sludge carried out to sea. The precipitation tanks at Dalmuir, which are to be worked on the system of under-surface continuous flow, are more favourably situated than those at Dalmarnock, each being about 750 feet in length, thus allowing opportunity for more complete precipitation than is afforded in the shorter tanks at the Dalmarnock works, and effecting a saving in the reduced proportion of chemical agents required for the process. The work that has been completed up to the present time represents a large proportion of the whole undertaking. The western outfall sewer is constructed, the Partick and Clydebank intercepting sewers are virtually finished, the Glasgow intercepting sewer is being vigorously advanced, the Partick pumping station is nearing completion, the precipitation tanks, dock, wharf and outfall works at Dalmuir are constructed; and the sludge tanks, pump-house, machinery and other works are in active progress, and sufficiently advanced to warrant the hope that the greater part of the sewage derived from the western area will be undergoing purification during the course of next year.

HOUSE PAINTERS AND DECORATORS' ASSOCIATION.

THE tenth annual convention of the National Association of Master House Painters and Decorators of England and Wales was opened at Nottingham on Tuesday. It was attended by a large number of delegates and others, including the Mayor of Nottingham, Lord Henry Bentinck, M.P., and the presidents of the Irish and Scottish associations. In connection with the gathering an exhibition of decorative art as applied to manufactures was also held. The Mayor, in the name of the city, welcomed the Association to Nottingham, and Lord H. Bentinck, in appropriate terms, formally declared the exhibition open. The president of the Association (Mr. John Riley, of Notting-

ham), in his inaugural address, congratulated the Association upon its interesting prosperity. He denied that they were united to combat labour, for they were actuated by much higher motives. They wished so to educate their lads that they might cope successfully with any form of decorative treatment required. The necessary instruction was not provided in the ordinary technical schools, but they had taken matters in hand themselves and established technical classes in nearly every town where there was a local association. Their ambitions in that direction, however, were not yet attained, but they had almost completed a scheme for the establishment of a national training school in which their lads could be educated instead of having to study on the Continent. The reading of papers followed. The social side of the programme included a reception by the mayor and mayoress and a dinner. The president-elect of the Association is Councillor J. Higson, of Manchester, and next year's convention will accordingly be held in that city.

REFUSE DISPOSAL.

A PAPER on "Twenty-five Years' Progress in Final and Sanitary Refuse Disposal" was read at Southport by Mr. W. F. Goodrich. He said for a long time past it had been generally conceded that the only system of disposal which was at once final and sanitary was that of the disposal by fire. Other methods had been tried, such as tipping on land, tipping at sea, sorting and utilisation, and in America a process of garbage reduction, but it might be fairly said that real progress had only been made with one system—disposal by the agency of fire. Tipping refuse on to land, and accumulating hundreds, and in some cases thousands of tons of filthy decomposing material was perhaps the most ancient method of disposal. That the hoarding up of filth in this manner was detrimental to health, and at times serious in its consequences, was shown by the several deaths in the neighbourhood of Portsmouth about a year since. Medical officers of health from Land's End to John o' Groat's, likewise from Dan to Beersheba, condemned the accumulation of refuse. The Local Government Board had but little sympathy with the practice; indeed, early last year they declined to sanction a loan of 300,000 required by the Corporation of Bury St. Edmunds for the purchase of land for tipping purposes. Little need be said regarding the tipping of refuse at sea, having in mind that such a method of riddance can only be employed in the case of towns on or in close proximity

to the seaboard. There was ample evidence available clearly show that this system of disposal was not satisfactory. Many years ago the refuse of Liverpool, dumped overboard miles out, was constantly washed up on the beaches of board resorts on the North Wales coast. Even last summer bitter complaints were made because of beaches defiled the north-east coast with refuse from large manufacturing towns on the seaboard. The tipping of refuse at sea has aptly termed "a fair weather system," by which was meant that in favourable weather only is it possible for the vessels to proceed to sea. Such a system cannot by any stretch of imagination be called sanitary, its irregularity conducing to nuisance, and was at once a fatal weakness. Sorting and utilisation, once a favoured method of disposal, was now rarely heard of. With a keen appreciation of the commercial value of the system was elaborated, and every effort was put forth the endeavour to popularise it, but without avail; while those who would still favour the tipping of refuse (so long as it is not tipped anywhere near their own particular residence), do not favour the loathsome and degrading practice of sorting. As already stated, in America a system of reduction has been extensively tried. In the main this process might be described as a process of cooking and chemical treatment of the garbage only; but as garbage comprised only about 13 per cent. by weight, or 18 per cent. by volume, of the average American civic waste, it must at once be admitted that this system was weak, leaving as it did the bulk of the waste still to be disposed of otherwise. As with sorting so with reduction, the commercial element had ever been the dominating factor. Such a system did not appeal to those who were in the main bent upon making money. They confined their attention to that proportion which offered a possible profit, while the bulk of the waste had still to be dealt with. The process of reduction was productive of nuisance, so much so that the necessary works had always to be erected well outside of a city, and even the inhabitants had on more than one occasion very forcibly shown their disapproval of the travelling odours. Although an immense amount of money had been subscribed and lost in the development of reduction processes in America, there were distinct signs that the system was becoming unpopular. It was likewise evident that destruction by fire was likely to greatly develop in the near future. Furthermore, American experts freely expressed the opinion that real progress was possible by following closely on British lines. Alluding to the method of disposal by fire, he said while many valuable improvements

es had been introduced in connection with destructors, it always be admitted that the really vital improvement the introduction of high temperature working, and only in as this had been recognised had real progress been made. In the burning of coal, a poor draught, with constantly low furnace temperature, involved imperfect ignition of the gases, a serious waste of fuel and the emission of black smoke. So with the refuse destructor, a low temperature in the furnace must result in the mere cooking of the refuse, and the gases must inevitably result in nuisance. The smoke was admittedly a nuisance, but noxious low temperature gases distilled from stewing refuse presented a nuisance probably without parallel. The modern high temperature system had rendered nuisance practically impossible. Improvements in design had been such as to effectually prevent the escape of dust; the residuum or clinker now produced was of a vitreous and perfectly inoffensive nature, and was used for a variety of purposes. Only with the high temperature system had the production of power become possible. It was idle to introduce a steam boiler to intercept low temperature gases, firstly because the temperature was practically useless for steam-raising purposes; secondly, because the primary duty of the destructor was, and is, to destroy, and unless this be done, and done in a manner above all else, steam raising should be left severely alone. Any attempt to secure and maintain a high combustion temperature had at the same time clearly demonstrated the value of the destructor as a power producer, and it had been established beyond all question that as the destructor was perfected for the performance of its primary duty, so did it become more satisfactory in the performance of its secondary duty—the production of power. The combination of a destructor with an electricity works had been the subject of much discussion, and had been very severely criticised. It might, however, be submitted that the most eminent critics had not stemmed the tide; on the other hand, the public had done not a little towards removing misapprehension and popularising the combination. If proof of its necessity be needed, then it might be found in the fact that as recently as five years ago destructors had been combined with electricity works in two towns only. Now sixty-one other towns had adopted the combination, while still many more had decided to combine the two works. It had been urged by some critics that the combination was only suitable for small towns, and this in the main because the amount

of power available from the refuse was not likely to meet the ultimate power requirements of the generating station, but surely such a line of argument must apply equally well, if not more strongly, to large towns where, for obvious reasons, the demand for current increases more rapidly. The striking progress which had been and was being made in large as well as in small towns was perhaps the most conclusive reply to such critics. In the city of Liverpool destructors were still being erected, arranged to supply power for electric traction, and this after most exhaustive trials. The unmistakable success of the combination had warranted the repeated extensions, and it must not be forgotten that for many years before it was decided to combine destructors with electricity works in Liverpool that city possessed its own electricity works of very large capacity. In conclusion, he said, twenty five years ago twelve destructor cells only were in use in two towns; to-day 1,650 destructor cells are either in operation or in course of erection in 180 towns in Great Britain, together with no fewer than 300 steam boilers. Nor was progress confined to these islands. On the Continent some large British destructors had been erected, also in Australia and New Zealand. There was every indication that the disposal of refuse would develop along these lines, and lastly, that in this particular branch of engineering, at any rate, Britain would be easily pre-eminent for many years.

NORWICH NEW CONGREGATIONAL CHAPEL.

A NEW Congregational chapel which has been erected in Magdalen Road, with a return frontage to Clarke Road, was formally opened on the 17th inst. The main elevation to the eastward consists of a large gable, with a Latin cross at the apex. It is divided by enriched buttresses, which terminate in octagonal pinnacles. The oak doors, which constitute the principal entry, are set in the stone jambs, and are flanked on either side by a three-light window. Immediately above the doorway runs a broad band of diaper in alternate brick and stone, and immediately above that is a fine segmental-headed window with three mullions. The side elevations have each six transomed windows with elliptical heads. Seats are provided for 700 worshippers—about 400 on the ground floor, and the rest in the galleries. A large iron roof spans the whole width of the church, and supports an elliptical-shaped plaster ceiling, with moulded ribs and

plaster enrichments. The main entry to the church is by way of two oak doors, behind which is a vestibule giving access both to the floor and galleries, the galleries being also approached from outside. There are four emergency staircases, each gallery having one at either end. The pulpit and the platform beneath it have been handsomely worked in teak. Beyond the pulpit is ample space for an organ, which will be provided as soon as funds permit; and also at the west end are deacons and minister's vestries. The fronts of the galleries are modelled in plaster. In the basement, or rather in the fall of the ground, the church having been built on a sloping site, are a choir assembly-room, a heating chamber and lavatories. The architects are Messrs. Edward Boardman & Son, Queen Street, Norwich.

PRESERVATION OF TIMBER.

A PAPER was read at the last day's meeting of the British Association by Mr. W. Powell on the preservation, seasoning and strengthening of timber. After dwelling upon the importance of timber to man, he said he might show how some kinds of timber, at present valueless, may become exceedingly useful; how timber used for structural purposes may be so strengthened as to bear a much greater load or strain; how our streets may be cheaply paved with sanitary wood-blocks which will neither absorb surface water nor give out disagreeable effluvia; how we may combat the ravages of dry-rot, and finally do all this simply, naturally and at comparatively small cost. He found that by boiling timber in a thin saccharine solution until most of the air in the timber was exhausted, and then by leaving the wood in the syrup to cool, a certain amount of sugar was absorbed by the timber, in some cases as much as to cause the timber to sink. After the wood has become sufficiently saturated it is put into a drying-stove and the moisture driven off at a fairly high temperature, until the wood is thoroughly dry and ready for immediate use. That process differed from others mainly in the fact that before drying is attempted the interstices of the timber are filled in with a viscid glutinous solution, which takes the place of the natural sap and air which the wood has been forced to part with, and so, when the moisture is driven off by stoving, the sugar which remains in the wood acts like a strong binder and holds the fibres together, just as cement or mortar binds the stones or bricks in a wall. There are thousands of square miles of land

in the States and Canada covered with timber which at present is of little commercial value. This class of timber is especially amenable to the Powellising process, and the results are somewhat astounding. Very remarkable results had recently been brought out at Silvertown, where some timber processed by Messrs. Burt, Boulton & Haywood's works showed the following results in increased strength:—Pitch pine, from 14 to 32 per cent; white pine, from 29 to 39 per cent; yellow pine, from 56 to 107 per cent. If this silvertown process could increase the strength of yellow pine from 100 per cent, then it follows that such timber would be able to bear a corresponding greater strain, or that 25 to 50 per cent less timber would be required to bear the same strain. The question as to the effect of the process on the flammability of wood—especially of such wood as the pines—has naturally arisen, for many persons imagine that because sugar is introduced into the timber it would become more inflammable. A little reflection, however, will show that the reverse should be the case, which, indeed, is borne out by tests. Timber properly processed will stand very high temperature in drying and be all the better for it, but each class of timber naturally requires modified treatment in each stage of the process. In all timber, and especially in walnut, oak, beech, box, maple, mahogany, &c., where there is a feather or grain, the process brings out the ornamental character of the wood more distinctly, and thus even some of the commoner woods may be used for ornamental purposes, as the appearances when cut and polished are much improved. By this simple and inexpensive process it is probable (1) that some varieties of timber now at present merchantable, especially some kinds growing in Canada and the United States, may be made of considerable commercial value, and thus an important addition be made to the world's stock of useful timber. (2) That such timber may possibly furnish us with an ideal paving block at once cheap, tough and sanitary. (3) That the lighter timbers used for structural purposes may be made to bear much greater strain without increasing their weight appreciably, and at the same time be rendered less inflammable and impervious to the attacks of dry-rot. (4) That hard woods, such as beech, birch, elm, ash, maple, mahogany, &c., have their valuable qualities enhanced, their liability to split or crack diminished, and their appearance when polished or varnished much improved; (5) that timber may be rapidly dried and seasoned, and that an enormous amount of capital now locked up may be released.

CONSTRUCTION OF TALL CHIMNEY SHAFTS.

Importance of constructing tall and safe chimney shafts suggested by the instructions concerning them introduced by the Metropolitan Building Act. Work of the kind is claimed by engineers as well as architects. In many parts of the country the manufacturers believe in local specialists who are guided by empiric rules. In consequence there is a great variety of proportions in different parts of the country. The Building Act orders that for 20 feet below the top the thickness be at least 8½ inches, and the increase a half brick for each additional 20 feet measured downwards. The width of the base of a shaft be square is to be at least a tenth of the proposed height and if round a twelfth of the height. The brickwork and mortar are to be of the best quality. It cannot be said the conditions are too severe for the cheap building which is now in vogue throughout the country exemplifies its worst qualities in brickwork which is found in the flues of houses, because it is generally concealed, and there is no doubt similar conditions have found their way into factory chimneys.

It is therefore an advantage if instead of the common method which requires both skill and care on the part of the builder when used in the construction of shafts, bricks or terra cotta blocks of special shape are employed. The principle of the latter is the essential principle of the Alphonse system, which has been adopted for about thirty years in Germany and also in the United States, Russia, Austria, Belgium, Norway, Sweden, &c., and two for the Elsa station of the Nile irrigation works. Four thousand at least, have been constructed, and their permanency is the best testimony to the qualities of the material and of the method they exemplify. Believing that round chimneys are effective not only for draught, but for resistance to wind pressure, the blocks are formed of radial shape, that is to say, the outer and inner lines become parts of the circumference of a circle while the sides tend towards a centre. They resemble in extent the voussoirs of an arch. They are made of various sizes, and therefore in construction the thickness of the chimney shows a break of joints, the mortar or cement being continuous. There is no need of the cutting of the blocks, or, in one word, the "fudging" unavoidable with a brick. The blocks are perforated, which not only lightens them, but allows of a more efficient bond than is possible by the ordinary "frog." As trained workmen only have employed the process of erection is carried on with all the

regularity of machine work. Economy is also secured, as there is no need of external scaffolding. A special lining has been invented to suit chimneys where gases or excessive temperature have to be contended against. From the arrangement by which the lining is supported on corbels it complies with the regulation of the Building Act, by which lining material is to be independent of the thickness of the brickwork, and not to be bonded therewith. There are coloured blocks which can be used in cases where it is considered desirable to impart variety to the exterior by ornamental patterns, initials or names.

In England and Scotland many tall chimneys on the Custodis patent system have been raised. It is remarkable that the majority of them are in connection with municipal undertakings, where, as the employment of any new system affects the reputation of the borough engineer, care is taken in the selection. Blackpool, Hornsey, Birmingham, Tunbridge Wells, Wimbledon, Watford, Bournemouth, Swindon, Reading, Worcester, Eastbourne, Mansfield, Wrexham, Maidenhead, Hanley, Taunton, Southampton, Coventry, Malvern are among the places in which Custodis chimneys are to be seen. In each of those cases there have been tests and investigations, and they form collectively the most remarkable collection of material testimonials to the efficiency of the peculiar construction which could be devised. The works for public and private companies are no less satisfying. While so many examples exist in this country, varying in height from 60 feet to 275 feet, further commendation of the Custodis system is unnecessary.

The system is protected by two patents in this country. The claim is for "A chimney having a lining built up in tiers or sections on internal corbels, so as to leave an air-space between the main body of the chimney and each lining, which air-spaces communicate with the outer air and the interior of the chimney through adjustable ducts."

FORESTRY IN GERMANY.

THE German forestry academies have developed in course of time out of the so-called "master schools" (Meisterschulen), which were founded during the second half of the eighteenth century. None of these schools now exist in the districts in which they were originally founded, but during the nineteenth century other academies and institutes for forestry were founded in their stead. At the present day the German empire possesses the following schools of forestry:—Tharandt, in Saxony; Munich and Aschaffenburg, in Bavaria; Eberswalde

and Münden, in Prussia; Tübingen, in Württemberg; Giessen, in Hesse; Karlsruhe, in Baden.

Students of forestry in Germany are generally divided into two distinct classes, *i.e.* into fully-qualified students and into extraordinary students or not fully-qualified students. The former, who generally form the majority, possess the full preliminary educational and other qualifications, and pursue their studies with the object of obtaining official positions in the State forests; the latter, who do not possess the full qualifications, are allowed to attend the academies and institutes if they can show a reasonable degree of preliminary education, but they cannot enter the State service.

In one respect, however, all the academies and institutes for forestry agree: they require, without exception, the leaving certificate of a "gymnasium," "real-gymnasium" or "upper real school." The courses in these higher preparatory schools are arranged for a period of from nine to ten years.

The object of the Eberswalde forestry academy is threefold and embraces (1) instruction in forestry; (2) the supervision of the forestry experimental stations in Prussia; and (3) the management of the Society of German Experimental Forestry Stations.

There are thirteen professors besides private lecturers, assistants, officials, foresters and servants. The course of instruction in forestry consists of two courses of one year each.

The instruction given in the lectures is supplemented by practical work of every description, for which a large number of scientific institutes, collections and other facilities for practical work are available; amongst these the following may be mentioned:—(1) Extensive woods of over 40,000 acres, containing oak, beech, birch, fir, pine, &c.; (2) forestry and chase collections; (3) botanical collection; (4) zoological collection; (5) physical and meteorological collections; (6) geodetical collection; (7) mineralogical collection; (8) library of 16,000 volumes and 300 maps; (9) various experimental gardens; (10) institute for pisciculture; (11) meteorological station; (12) various laboratories; (13) vegetation house; (14) dog-breeding establishment; (15) seed-testing institute.

A special feature of the Eberswalde academy consists in the great number of excursions arranged for practical work, inspection and scientific observation. These sometimes amount to seventy or eighty during the year, and range from smaller excursions of one-half or a whole day to longer excursions of two days, and in August to excursions of from a week to ten days. They are almost without exception conducted by pro-

fessors of the academy or some member of the scientific staff. The department for experimental forestry includes branches for special forestry, for meteorology, for the physiology of plants, for zoology, for the chemical investigation of soils and for mycology. Amongst the scientific publications issued by the academy during the year the following may be mentioned:—(1) Editing of the "Review of Forestry and the Chase" and of the annual publications in forestry and chase legislation and administration; (2) The results of the experiments made in the cultivation of foreign woods in the Prussian State forests; (3) Critical comparison of the most important forest-technical and forest police regulations of German and foreign forest administrations; (4) The atmospheric conditions of the single months of the year 1900; (5) On the extermination of rooks; (6) The occurrence of noxious animals in Prussian State forests; (7) Annual report on forest zoology; (8) Chemical processes in sterilised yeast cells; (9) Chemical problems and exercises for agriculturists; (10) Investigation on the warmth of soils; (11) Forest produce in the German Tariff Bill; (12) The representation of the interests of forestry in the Agricultural Chambers; (13) Planting experiments with various trees; (14) The value of wood-litter for forest protection.

Persons desirous of commencing the study of forestry at the object of obtaining positions as higher forestry officials in the State forests must prove that they are in possession of the following preliminary qualifications:—(1) The leaving certificate of a "gymnasium," "real-gymnasium" or "upper real school," with specially good marks in mathematical subjects; (2) age under twenty-two; (3) that they do not suffer from hereditary, aural, visual or vocal defects and are of a strong and healthy frame of body; (4) certificate of good conduct; (5) possession of the necessary means for studying.

After having satisfied these conditions, candidates are required to undergo a period of practical forestry work of at least one year under the supervision of a higher forestry official. This is followed by a period of study of at least two years at a forestry academy or at a university forestry institute. The examinations which are then required are in number.

The application for admittance to the first examination must be sent in not later than six years after the period of practical forestry work, and must—in addition to the school and academy or university certificates—be accompanied by the following:—(1) Certificate of one year's practical forestry

TO BOROUGH ENGINEERS, SURVEYORS, ARCHITECTS,

Hassall's Patent Water Closet.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE, 1902.

Excelsior and Rawdon Potteries.

(2) a "curriculum vitæ" written by the candidate; (3) a detailed map, drawn by the candidate, of an area of at least 100 acres, based upon the results of a practical survey made out by the candidate himself, together with field notes and tables of co-ordinates and measurements. This must be performed with the aid of a theodolite and a level; (4) a coloured map detailing the principal features of an area of at least 1,250 acres on a scale of 1 to 25,000; (5) a plan of a length not less than 1½ miles, with the candidate's field-book and calculations; (6) a declaration on oath that the work indicated under 3, 4 and 5 has been performed by the candidate himself without external aid.

The following standard of knowledge is exacted in the subjects of the first examination:—

Forestry.—Thorough knowledge of the whole science of forestry with reference to forest cultivation, forest management, forest valuation, utilisation of forest produce, forest protection and police, history and literature of forestry.

Pure Mathematics.—Knowledge of arithmetic and algebra including equations of the second degree, logarithms and their practical application and the theory of series; geometry of planimetry, stereometry, plane trigonometry and spherical trigonometry as well as linear and angular co-ordinates.

Surveying.—Knowledge of plane surveying, levelling and the construction of geodetical instruments; barometrical measurements; proficiency in the manipulation of all levelling and levelling instruments; proficiency in drawing up the details of simple survey work; knowledge of Prussian survey regulations, with special reference to survey work.

Statistics and Mechanics.—Knowledge of the elements of statistics and mechanics.

Zoology.—Acquaintance with the systematic classification of the animal world, and knowledge of the most important animals, birds and insects for forestry and the chase; thorough knowledge of the systems, nomenclature, anatomy and habits with special reference to noxious insects.

Botany.—Acquaintance with a recognised good system of classification, practice in the classification and description of plants with the use of suitable terminology; special knowledge of German varieties of wood and other plants of importance for forestry.

ance for forestry; acquaintance with the general laws and theories of the anatomy and physiology of plants.

7. Mineralogy.—Knowledge of geognosy and geology as far as is necessary for the purpose of a general and clear comprehension of the formation and structure of mountains, &c.; total and most important constituents of the latter with special reference to their action upon the growth of vegetation; knowledge of the rocks, minerals and soils of the most importance for forestry.

8. Chemistry and Physics.—General properties of the elements and principal compounds; principal chemical theories and laws; heat, light, magnetism and electricity; special reference to forest technology (preparation of charcoal, lamp-black, &c.).

9. Law.—Knowledge of the historical development and the general elements of Prussian and German material and formal law, and of the principal chapters of civil and criminal law regarding the administration of forests.

After passing the above examination the candidate is accorded the title of forestry "Referendar," and is now required to undergo two further years of practical forestry work, during which time he must keep a careful daily record of the work performed. He may then enter his name for the second or State examination, accompanying his application with the following papers:—(1) "Curriculum vitæ;" (2) leaving certificate of higher preparatory school; (3) certificate of the first period of practical work (one year); (4) forestry academy and university certificates; (5) certificate of the second period of practical work (two years); (6) military and other personal papers.

This final examination embraces the following subjects:—(1) All branches of forestry science and economy; (2) Prussian and German law, especially administrative, constitutional and private law; (3) political economy; (4) financial science; (5) organisation of forest administration, official duties, forest budget and accounts, regulation of the chase, &c.

Those forestry "Referendars" who pass this second examination successfully are promoted to forestry "assessors," and their names are placed on the list for available positions as higher forestry officials (Oberförster, upper forester). Until they obtain such definite positions they are generally occupied by the State at a certain scale of daily remuneration.

The entire area of the German empire amounts to about 135,000,000 acres, of which about 126,000,000 acres are devoted to agriculture and forestry. Of the remaining 9,000,000 acres,

which consist of waste and barren lands and of land used for industrial purposes, about 2,000,000 acres might perhaps still be reclaimed for agricultural and forestry purposes by means of bog-cultivation and drainage.

Of the entire agricultural area of 126,000,000 acres, about 35,000,000 acres, or more than one-quarter, consists of forests or forest land. About 18,500,000 acres of the total forest area are cultivated as purely forest holdings, and about 16,500,000 acres are attached to agricultural holdings. The total forest area is distributed amongst 950,000 holdings, of which the greater number are only of small extent; of the larger ones, about 2,000 belong to the States and Crowns, and possess a total area of about 12,500,000 acres; of the small holdings 97 per cent. are attached to agricultural holdings, so that, to a certain extent, they may be considered as agricultural holdings. It would seem that the number of agricultural holdings, with forests lands attached, is gradually declining, most probably owing to the increased efficiency of farming. On the other hand, forest land shows a gradual but distinct increase.

Although the example of the German empire shows that it is possible to reap a substantial annual benefit from instruction in forestry and the consequent rational cultivation of forests, mere pecuniary gain is by no means the sole factor which ought to justify the solicitude displayed on their behalf by far-seeing governments, as there exist many other reasons, dictated by other motives and considerations, for the cultivation and preservation of forests.

The forests of a nation are closely bound up with the lives of the people in legends, poetry and history. In olden times they were protected by laws and statutes under pain of severe punishment, and they are still preserved in some countries with the greatest possible care, not only by the State, but by private landowners, provincial and municipal corporations and other bodies. An empire of the inland extent of Germany, for example, requires for social, hygienic and climatological reasons a larger extent of forest-land than countries with a less extent of inland and longer coast-lines. The proximity of forests acts upon those who dwell in or near them in a similar manner as the proximity of the sea exercises a healthy influence upon those who dwell on or near the coasts, and it may be asserted that, to some extent, a country without forests resembles a country without a coast.

The inhabitants of the forests, the foresters, wood-cutters and other forest workmen and dwellers are as regards health, strength and a certain native shrewdness and sagacity, as

superior to the peasants of the plain as these again are superior in health, strength and many sturdy virtues to the major inhabitants of the towns.

From an æsthetic point of view forests are also necessary, as necessary in their special province as da moors; heaths, rocks, mountains and even bleak lands, all form the necessary complement to cultivated land, and impress upon the beholder the infinite play of contrasts and variety displayed in all the manifestations of nature.

Finally, from a climatological and hygienic point of view the value of forests to a nation cannot be too highly estimated. The presence of large forests supplies the air with moisture and most probably exercises influence upon the regularity and extent of the rainfall; heavy and protracted rainfall might cause serious inundations is regulated to a greater or lesser extent by forests, which act as natural reservoirs for water storage and gradual supply. Air vitiated with dust and other impurities, chemical, physiological and mechanical, passes into forests to undergo filtration and chemical transformation, and issues forth again purified and revived with health-giving constituents. The fate of parts of Italy, which under rational conditions of forestry and agriculture, have been the paradise of Europe, is a warning example of the many others of the dangers that attend the practice of reckless deforestation, and the conclusions to be drawn therefrom have not been overlooked in Germany, where unruly forces are now being rendered amenable to control by afforestation of their sources.

The devastation caused by the recent floods in Silesia is a necessity of action of this nature in Germany.

In Switzerland, where the floods have wrought much damage during the rainy summer of this year, an influential party is advocating the diminution or prevention of floods by afforestation instead of by engineering works for the regulation and correction of the courses of rivers, to which latter the preference has hitherto been given. The Association of Foresters, which met lately at Schwytz, has expressed itself most emphatically in this sense.

Leaving aside the question of the relative efficiency of two methods of the prevention of floods by river regulation and afforestation, the former is certainly much more expensive than the latter. Between 1871 and 1901 the Swiss Government expended about 2,000,000 l. on the regulation of rivers by engineering works, and only about 125,000 l. on afforestation for the same purpose.

The Architect.

THE WEEK.

rumour that three such historical buildings, which at the same time remarkable examples of architectural art, the Villa Caprarola, the Villa Madama, outside Rome, and the Farnese Palace, in Rome, are in the hands of the same owner, is enough to startle all lovers of art. The Villa Caprarola stands on Mount Simino, and is at some distance from the road to Siena from Rome. It was designed by Bramante for Cardinal FARNESE, the nephew of PAUL III. It is recorded that St. CHARLES BORROMEO remonstrated with its owner about its magnificence. So much money, he thought ought to have been given to the poor. But the Cardinal's reply was that he preferred to let them earn it. The villa is pentagonal on plan, and surrounded by ramparts and bastions. The rooms are adorned with paintings by the school of Raphael. The history of the FARNESE villa is full of incidents in the history of the FARNESE family. English visitors are somewhat disappointed with the building, for in trying to combine a fortress with a villa the result seems to be expressive of neither. The Villa Caprarola is said to have been designed by GIULIO ARMANDO, but it is believed the plans were RAPHAEL'S. It is never finished, but the position is excellent, and the views by GIULIO and GIOVANNI DA UDINE are interesting. The Palazzo Farnese was mainly designed by SAN CARLO CARRACCI; the famous cornice is by MICHEL ANGELO, and the interior is by VIGNOLA. The owner wished, it is said, to make it a museum, who had been a footman, the architect. The rooms were partly derived from the Coliseum and the Theatre of Marcellus. At the present time the villa is occupied by the ambassador of France. It is considered to be one of the most important of the Renaissance buildings. Among the paintings is one on the wall, the *Triumph of Bacchus*, by ANNIBALE CARRACCI, which a large plate was published in *The Architect*.

EUGÈNE TRAIN, who died suddenly on September 20, one of the prominent official architects of Paris. He held the municipal service in 1853 as an overseer of the city, and he advanced step by step through merit alone he obtained one of the highest positions. Half a century's loyal service certainly deserved honours and rewards. As his colleague M. BOUVARD said in a speech at his funeral, M. TRAIN was one of the first who attempted the use of metal and ceramics in the decoration of buildings, the success of his efforts is shown by the Collège Rollin and the Lycée Voltaire. M. TRAIN was a nephew of the architect BALTARD, the architect of the church of St. Etienne and the Halles Centrales in Paris, and his body lies in BALTARD'S tomb. M. TRAIN was a member of the Council of architecture for the Prefecture of the Seine, and honorary professor of the National School of Decorative Art.

The session of the Liverpool Architectural Society will be held on Monday evening, when an address will be given by the president, Mr. JOHN WOOLFALL. The following papers are to be read at succeeding meetings:—MR. PETER COWELL, "Venice"; MR. W. CURTIS GREEN, "The Architecture, Formal or Irregular"; MR. H. FIELD CLARKE, "The Bill for Altering the Law of Light"; MISS ETHEL CHARLES, "Reflections on Architecture"; MR. E. BERTRAM KIRBY, subject to be decided; MR. E. GUY DAWBER, "Country Houses"; MR. MATTHEW HONAN, "John Wood of Bath"; MR. RYAN TANNER, jun., "Interior Woodwork in England"; MR. FRANK RIMINGTON, "Small Houses of To day and To morrow"; MR. G. GILBERT SCOTT, "Notes on the Liverpool Cathedral"; MR. HASTWELL GRAYSON, M.A., "The Domestic Flue." The annual general meeting will be held on April 4, 1904.

CELLULOID has for some years past been employed in the making of set-squares, scales and protractors. It has the advantage of lightness and smoothness of surface. Its cleanliness of paper is never soiled. White celluloid allows black or gold figures to be legible. It is, how-

ever, uncertain whether the material does not expand or contract to a degree which diminishes its use, especially when the utmost accuracy is desirable. Messrs. LONGMANS, GREEN & Co., the publishers, having a wide connection among educationalists, engineers, architects and men of science, have brought out a series of aids to drawing in the form of set-squares, protractors, scales, &c., in which all the advantages of celluloid are retained, and by using a very tough wood for edges the risks of shrinkage or other distortion will be avoided. They are the invention of Professor D. A. Low. One ingenious addition is an "adjustable protractor set-square." Imagine the long line or hypotenuse of a set-square to be formed as an arc of a circle and the material to be divided in order to form a groove. In this if another arc graduated is placed it will have motion and the chord will serve as a ruler for any angle desired. This protractor will be found useful not only in geometrical drawings but in laying bases for various ornamental forms. With all the improvements the prices are as low as for ordinary celluloid squares, and the appliances are the best substitutes which have yet appeared for those in ivory and boxwood which were once generally used.

THE GONCOURTS, who delighted to present literary celebrities with their wrong side outwards, were compelled to admit that DUMAS FILS was the possessor of a grand talent, that for women as well as men he idealised the commonplaces of their hearts, and that the man himself was superior to the dramatist. Women especially were the studies of DUMAS, and types of them are the most successful of his *dramatis personæ*. M. SAINT MARCEAUX, the sculptor who is entrusted with the memorial of DUMAS which is to be set up in Paris, has endeavoured to suggest his peculiar genius by representing him as listening to the appeals of a crowd of women who look up to him as if he were the redresser of their wrongs, or their advocate with posterity as well as contemporaries. They stand by the pedestal on which the dramatist is seated, clad in the unconventional costume he preferred when working. As his attention seems turned towards them, they are introduced only on one side, and the indifference to symmetry becomes a characteristic of the work, which is novel and not displeasing. M. SAINT-MARCEAUX has set up the model of his work in order to test its general effect. The treatment of the principal figure is true to nature. It would be absurd to represent DUMAS FILS as if he were in the "fine frenzy" of poets. He declared he was without imagination, and that all he did was derived from observation, reflection and deduction. For months he kept considering a subject without writing a single word. The labour of writing was fatiguing and suppressed his appetite, but he found compensation in being able to sleep better than at other times. A rigorous sobriety was necessary with his delicate constitution, and he avoided wine, coffee and liqueurs.

THE Council of the Victorian Institute of Architects, whose "Proceedings" are models of typography that put to shame those issued by European societies, has boldly taken the rôle of arbiter of taste for Australia. Even postage stamps are not considered too trivial to engage attention. A new stamp was lately issued and the Postmaster-General received the following protest:—"That this Council, representing the members of the Royal Victorian Institute of Architects, desires to place on record its deep regret that the first Commonwealth postage stamp should be so utterly weak and inartistic in design, and also to express the hope that it will be withdrawn from issue to prevent our Australian designers being held up to ridicule." The rebuke was received with good-humour, for the following reply was sent:—"I have the honour by direction to acknowledge the receipt of your communication of June 23, and to thank your Council for its criticism, contained in the resolution you forwarded, of the new Commonwealth postage stamp. I am to add that any design of greater merit that may be submitted to this Department will receive consideration." Will the members of the Victorian Institute accept the hint and design a model stamp?

ARCHITECTURAL EDUCATION.

ONE of the easiest ways of realising the extent of a change in manners and customs is to imagine a man of an earlier period returning to the world, and to ask ourselves how far he would be surprised by what he saw. Let us suppose an English architect who passed away some sixty years ago revisited his own country at the present time, when the educational sessions are about to open. Can there be any doubt of his amazement when he discovered the facilities which are being offered throughout Great Britain for the training of youths who are ambitious to become architects? In no other calling is there so much eagerness to obtain candidates. The recruiting sergeants do not put forth such temptations in their addresses as will be found in the programmes of courses which are especially intended for students of architecture. Lawyers give no sign of a desire to have their ranks strengthened. Medical professors do not provide courses or clinical lectures at popular prices. The churches are all said to be in need of pastors, but there is no seeking in highways and byways for them. Even in the Army and Navy it is not easy to secure recognition as a student without a liberal expenditure. But as regards architecture all the mysteries are revealed, not only in London, but in Manchester, Liverpool, Birmingham, Leeds, Glasgow, Dundee and other places for almost nominal fees.

If our ghost, after his sixty years' exile, were to return to his old office and to glance over the prospectuses and programmes which would find their way to him, he could hardly fail to ponder over the differences which exist between now and then. In the forties of the nineteenth century architecture might be called a close profession. The parents and guardians of youths understood there was only one way open to aspirants, which was by paying a premium for the privilege of entering an architect's office. It was not clear to outsiders what kind of training was to be followed. They had to take their chance as to whether after the specified time the youths were capable of building cottages and cathedrals. As there was no second means of approach, a good many PECKSNIFFS were able to gain a comfortable living by acting as toll-keepers. In London there were professors at that time in University College and King's College, but they were looked upon as no more than auxiliaries to the long-established system of producing architects.

It is remarkable that in the forties authors and publishers seemed to be afraid of meddling with the legitimate process of which so many worthy and wealthy men were the results. When JOHN WEALE, who as a bookseller was aware of the state of things, courageously published a shilling series of technical volumes like those used in France, he was encouraged by the approval of men of science and engineers. But having a liking for the art and knowing that people were interested in Gothic churches he brought out two or three little treatises on architecture. It is evident he did not calculate on receiving much support from architectural students. For instance, in the preface of LEEDS'S treatise on the Orders we read:—"Those who pursue the profession of architecture must, of course, apply themselves to the study of it technically, and acquire their knowledge of it, both theoretical and practical, by methods which partake more or less of routine instruction." In other words, no method of gaining knowledge outside the office was to be considered as of any use in the training of the English architects of the future. It would take us long to describe the events which have led to the change in policy. A great many architects still maintain that the old-fashioned system of education in an office continues to be the most effectual and is not to be superseded by lectures in colleges or by the reading of books. They would argue that an efficient architect can be turned out by pupilage or apprenticeship, while it is doubtful whether any architectural professor or teacher would have the courage to assert that an architect can be fully trained in their classrooms without any experience in an architect's office. There are certain essential duties called by some mere routine, and by others professional practice, which are of the utmost importance, and the training therein is only to be acquired by taking some part in the affairs relating to them. They may be treated as abstractions by professors, but they assume a different appearance in an office.

To all who have the least experience of architecture as a business or an art, what we have said will seem to be an unnecessary statement of everyday realities. We are a young people have a different opinion. SETH PECKSNIFF, to whom we referred, is still considered as being the best of large numbers in the profession rather than a fantasist of the imagination. His acquirements could easily be surpassed. In the numerous art schools where originally it was only professed to teach architectural drawing, the instruction has been generally described as "architecture." There is also, of course, a building instruction course, and to a young mind it seems hardly a combination of the two does not make an architect according to a Government standard. If, then, a more elaborate system of education is followed, and one in which professional architects take a share, it is allowable to suppose that no obstacles can arise to the perfecting of a student and that when the courses are over he will be competent to open an office, put a brass plate on the door and execute all manner of commissions.

It would be well if in all classes of the kind, but especially in those where architects co-operate, there were a little plain speaking at the commencement of a term. It should be impressed on students from the first that they can only be partially instructed in the classes of art schools, colleges or polytechnic schools. They might also be told that unless they are careful and attentive the knowledge they are about to receive may not be advantageous to them afterwards. In the course of the inquiries made from time to time into the working of Government art schools, it has often been declared by manufacturers that they find great difficulty in overcoming the defects of students, who in gaining various rewards come to them for employment, who by their incapacity, conceit and indifference to practical necessities become almost as unfitted for everyday duties as if they were untrained novices. A similar experience is found in architecture, and it is often said half seriously and half jokingly, that double premiums should be charged for students who have gone through a complete course of architecture in one of the new institutions. All knowledge is good, and, if rightly used, even a Government class should be beneficial, but what is to be considered is not the instruction as it stands before men of experience and how it can realise its partial extent, but rather as it usually appears to the imagination of the young, who have only insufficient means of testing its incompleteness in practice.

If adults would but recall their days of studentship they would own to their difficulties in seeing any connection between most of their studies and actualities. How can we have they discussed with their fellow students about the advantage of learning mathematics, dead languages, and so on? The pages before them constituted the dreary world with which they were concerned. In technical and art schools there is a like constraint. In the last report of His Majesty's Chief Inspector of Art Instruction we read:—"The study of architecture often shows too much reliance upon the text-book. Schools which have no architectural museum or a good collection of architectural casts are often near admirable buildings to which the student should more often resort for study. The profiles and mouldings are not seldom practically ignored, whilst the elaborate drawing of the enrichments of the mouldings is made." The defects of the architectural students are described only correspond with those in literary and other classes. The true relations of whatever engages them are overlooked, and what they perform is on that account rarely profitable to them.

A pupil who is a short time in an architect's office would acquire a more definite notion of what mouldings are and how far their adornment corresponds with their scale and profile. What is true of mouldings applies equally to other subjects. If employed to supplement the work of an office, the instruction offered in colleges and schools should be of service. It is not to be expected that an architect or his manager could afford the time to explain how strains in beams and roofs can be worked out, or could show the correspondence between the details of various styles. In the same way, many other questions arise which a pupil would wish to have answered, but which a press of business will prevent. In such cases it is well to have a friendly guide to whom recourse can be had, whether as a professional

a tutor. There are now a great many of the latter who are willing to resolve difficulties for slight remuneration. Students should be aware of these facts. If they suppose that by following a certain number of lessons they will be enabled to perform the variety of work which an architect in ordinary practice will have to do, then we fear they are preparing themselves for many disappointments.

CEILING DESIGN.

ON March 10, 1501, HENRY VII. incorporated the Plasterers' Company. The Master and Wardens to sue and be sued as "The Guild or Fraternity of the blessed MARY of Pargettors, commonly called Plasterers, London." The introduction of the two names is suggestive of the development of the trade. Parget is related to the Latin *paries*, a wall, and signified work on walls or partitions. A plasterer afterwards was less bounded in his operations, and could employ the material not only vertically but horizontally. Indeed, the London members of the guild were disposed to consider they could meddle with all trades. Before a century was over they were found working with the tilers and bricklayers, and at a later date the paper-stainers were compelled to obtain a special charter to prevent the plasterers from exercising the art or the use of painting with oil-colours as well as size-colours, the latter alone being permissible with them. The documents stated that they could procure for themselves and their families a convenient living and maintenance by nothing but lathing, daubing, plastering and lime-

work; it is remarkable that in Rouen, where more records relating to trades are preserved than elsewhere, although the statute of the plasterers is only dated 1478, there are still regulations which go back to 1289, and the statute in question was no more than a consolidation of earlier regulations which had become so numerous as to cause confusion. Most of the old houses in Rouen were of timber, and in consequence were liable to fires. Plaster was used as a supplementary material, especially in the construction of chimneys, and at the time there was no belief in its protective qualities. One of the objects of the statute was to prevent the introduction of plaster did not increase the risk of fire. It does not appear that in Rouen plaster was in use years prior to 1478 employed for ornamentation. The ceilings of rooms were of wood, and if figures, armorial shields or decorative panels were introduced on the ceiling, or they were generally carved in stone or wood. It may therefore be assumed that both in England and in France up to the end of the fifteenth century the use of plaster was limited to utilitarian purposes. The extension of its employment in decoration is evidence of a great change, which can be attributed to several causes.

One was undoubtedly the use of *stuc* or *carton-pierre* by Italian sculptors, and several examples of figures in that material have been preserved to our time. The Palace of Fontainebleau is supposed to have been one of the earliest examples in which plaster was employed for architectural decoration. At a later time it was introduced in the Netherlands, and GIOVANNI DA UDINE was ordered by MAXIMILIAN to decorate the vaults of the loggia with the material. The use of *carton-pierre* was supposed to be derived from the small figures and ornamentations in stucco then discovered amongst the ruins of the Palace of Pompeii.

Evidently the Renaissance artists had been desiring a cheap yet enduring means for decoration in relief. According to VASARI, they could obtain nothing better than a compound of gypsum, chalk, pitch, wax and red bricks, which they afterwards gilded. GIOVANNI, after many experiments, found that by mixing white marble dust into dust and sifted, with white travertine lime he was able to make stucco equal to that of the ancients. The success of the ornamentation was so manifest that commissions appear to have been given rather than the artist was able to execute. Some painters were so pleased with the results that they endeavoured to employ the material for figures in the foregrounds of their wall-paintings. PINTURICCHIO

and CARLO CREVELLI were amongst them. But the illegitimate combination of modelling and painting, although amazing to the ignorant, was soon discovered to be not deserving of approval.

Although the manipulation of stucco and plaster had been reacquired, there was some hesitation about applying it more than partially in the decoration of ceilings. The Moors, for instance, were admirable workers in plaster and stucco, but in the Alhambra they were careful to avoid showing large areas of the material. OWEN JONES, in the restoration of a part of the Alhambra at Sydenham, employed plaster ceilings, but he acknowledged that he departed from his model, where the ceilings are of wood, and sometimes, as in the Hall of Justice, the wood was allowed to exhibit its own colour. The earlier Renaissance ceilings, in which the Gothic arrangement was departed from, consist of mouldings or ribs in connection with wooden beams, and the plaster is therefore allowed to be only a subordinate accessory. Not only the main lines are joiners' work, but the subdivisions also, although not necessarily disposed in such a manner as to suggest a system of beams. SERLIO, the architect, appears to have introduced the system into France by which a series of compartments were left for decoration either by means of painting or stucco-work, and a great variety of arrangements became practicable. It is doubtful whether a Renaissance architect would not be horrified by the wide expanse of flatness, broken only by a centre-piece and a cornice, which is to be found in the majority of the rooms in modern buildings.

It is remarkable that Gothic architects endeavoured to resist the innovation in some places by compromising their own style with that of the Renaissance. VIOLETT-LE-DUC says that "in breaking away from the routine by which the masters of the fifteenth century were enslaved, they applied to new forms the resources of the art of building of the Middle Ages. At the beginning of the sixteenth century architects very frequently employed the system of vaults composed of slabs resting on ribs, which allowed them to decorate these vaults with rich sculptures and to obtain effects until then unknown. Arranging a sort of network of stone, with key pendants or floral ornaments at the points of intersection of the ribs, they placed sculptured slabs between them." But it must soon have been perceived that there was no advantage in having heavy stones and costly carving hanging over people's heads, when another arrangement was available which was light, cheap, yet effective.

In England there was at first a desire to have ribs arranged in geometrical forms, and to fill in the panels either with plastering or with a material resembling *carton-pierre*. There is little doubt that in the sixteenth century Italian artists had emigrated to England, it may be stopping on the way in France; and, in consequence, there is often more elegance in the ornamentation of the ceilings than in the carving. Strap-work perhaps could scarcely be considered as their work, but even with it there is a filling in of spaces which recalls the South.

The ceiling of a room presented a freer field than the walls or floor for the decorator. There need be no break in a design by the introduction of large pieces of furniture or other objects. The Elizabethan or later artist could therefore treat his ceiling as a whole, or adapt a series of panels to it. As a rule, in England there was a fear of the former system. We cannot always say which part was considered to be most important. The ceiling may have been planned in such a way as to allow of the use of some one pattern, but it is also possible the pattern was already in existence, and the space had to be accommodated to it. When we say a pattern, it may have been one of several elements that would by itself form a little ceiling. But whether simple or elaborate, it was repeated until the space at disposal was covered. The spectator must feel on looking at one of these ceilings that the ornamentation could be carried on over a far wider area; or, if necessary, vastly diminished without any loss of effect. There is neither a definite beginning nor ending. The elements may be formal, but from the manner of using them they lose much of that quality. Another peculiarity arises from the all-overishness of the ornament. There are no plain spaces to repose the eye,

and by force of contrast to enhance the effect of the ornament.

INIGO JONES brought the treatment back to the more pure continental manner then followed by Frenchmen and Italians. The ceiling was not apportioned out into divisions corresponding with one element or pattern. There appeared to be a systematic arrangement in which principal and subordinate parts were recognised. He realised also to some extent that the ornament of a plaster ceiling should be superficial, and there was no need to go back to ancient Roman examples when ceilings of temples were cut out of stone slabs or formed of bronze castings, and it was becoming to demonstrate that the material was no mere incrustation. When WREN came he had not the courage to insist on the rationale of ceiling decoration. He adopted French models, but in the selection he was hampered by want of sufficient acquaintance with the practice of the artists of that country. It would have been easy for him to discover that they were also partial to ornament that was in very slight relief and as delicate as if modelled by a *sucrière* or a lacemaker. He preferred the coffered style from its massiveness. WREN'S ornament also was inspired by GRINLING GIBBONS, a sculptor who could fashion lace cravats out of wood, but who liked to present images of substantial fruits which seemed ready to drop into the mouths of spectators. They are excellent if considered as representations, but something more appropriate in form is desirable in a ceiling.

ALBERY, GATTON AND MERSTHAM.*

WE have to-day visited three places, each possessing a peculiar interest of its own, and it is hoped that the following brief account of them will be worthy of your attention.

Albery was formerly a separate manor, though included within the parish and now amalgamated with the Manor of Merstham. The name is spelt in the Domesday Survey as Albery. It seems remarkable that a few years ago our Society visited Oldbury Moat at Enfield, under the leadership of Messrs. McKay and Harradence, and that the old earthwork we saw at Hedbourne a fortnight ago was situated on Aubrey Farm—the field inside is called Middle Aubrey and that to the north of the camp Long Aubrey—and that to-day we have seen a moat at Albery Farm.

These words, Oldbury, Aubrey and Albery are no doubt various ways of spelling the Saxon words designating an ancient dwelling-place, and it is significant that in each instance they indicate an earthwork of some kind. The county histories give the usual extract from Domesday Book and the list of persons who held the manor from time to time, but the following paragraph from Manning and Bray's "History of Surrey" is perhaps more worthy of your attention:—

"At Albery was formerly a capital mansion house, the residence of the Southcotes." The family had held to the old ideas and still acknowledged the supremacy of the See of Rome in this land, and in the reign of Charles II, when one of the family died, and was refused burial in the churchyard of Merstham, they abandoned the mansion house, and some years later—about 1750—it was demolished. It is said to be the Rector Sambourn, who held the living of Merstham from 1675 to 1723, who would not sanction the burial of this member of the Southcote family. We must remember, in looking at this incident, that in 1679 Titus Oates flourished, and in 1680 Lord Strafford was beheaded, and that it was a period when violent prejudices and strong passions held full sway on both sides.

Manning goes on to say of the house that it was called by way of eminence "The Place." It stood in what is now called the Great Meadow, through which runs the rivulet forming a paddock. On the opposite side of the road a field of three acres retains the name of the "Walks." The chapel is said to have been splendid. The family were very benevolent, and the last Lady Southcote is said to have taken her station at regular stated times on the garden terrace overlooking the road, in order that she might hear the petitions of those who were in distress and satisfy the claims of the indigent poor.

Here is no mention of a moat, but, from the allusion to the chapel and faith of the Southcotes, it seems certain that they were established here at a time when the majority of mansion houses were surrounded by moats.

Albery was not a very large manor, and it seems unlikely that within its limits there was more than one mansion house.

* A paper read by Mr. Jonathan Downes before the members of the Upper Norwood Athenæum.

The description of the Great Meadow from which the cuts off a paddock corresponds so exactly, that it is a reasonable assumption that the spot we visited this afternoon was the site of the old abode of the Southcote family.

Of Gatton Mr. Leveson-Gower, F.S.A., said at a meeting of the Surrey Archaeological Society in July 1879, "situated on what is called the Pilgrims' Way. Its name is Gate town, as Reigate may be Rige Gate—the Gate on Reigate (Gate, it may be said, is here used in its secondary or meaning of a way or road. "Gang your own gait—go your own way.") "Peculiar interest attaches to the road, as it is one of the earliest marks of civilisation that the county possesses, leading between two of the chief towns of England, Winchester and Canterbury." Mr. Leveson-Gower need not have limited its course. It might well have run from Dover or even Penzance, not only to Canterbury but to Dover. It may have been one of the old Ridgeways or Icknield ways, one meets in many parts of the land. Some of you will have heard King Alfred's blowing stone and seen the White Horse and Wayland Smith's cave, will remember that the road stands beside one of these very old Ridgeways. Indeed, it goes on to say that this part of it may have been a British road anterior to the Romans, but used by them to witness the remains of villas at Abingdon and Colley, and at Reigate; coins, &c., here at Gatton, and more villas at Icknield and Titsey."

These latter are also on the Pilgrims' Way, as it is marked on maps, and I should here mention that in the time, about sixty years ago, the lane turning out of the road to the east nearly opposite to Merstham Church was called Pilgrim Lane.

But Gatton was an ancient place before Thomas Becket was slain and before the pilgrims began to come this way to his shrine.

Brayley says that in the time of Alfred the Great a duke gave land at Gatetune to his son Ethelwald. There have been another place of similar name, but this is certainly the Gatone which is described in Domesday Book, and it was held by Herfrid of the Bishop (Odo of Bayeux). In the details in Domesday Book it is certain that no castle existed here then, although Aubrey, writing 600 years later (under the belief that there must have been a town here, there were members of Parliament), boldly invents a story of the town to the south-west of the house, on the site of which he says a castle formerly stood.

Odo forfeited the manor to the Crown when Rollo of Normandy, whose cause he had espoused, was defeated by William I., surnamed Rufus.

Hamo, who assumed from it the surname of De Catesby, then held the manor of the king *in capite* by service of a knight's fee and payment of castle guard to Dover Castle. It remained in his family for some 300 years. Then occurred a very memorable event in the history of Gatton. In the reign of King Henry VI. granted it to John Tymperley for his services and faithful services, in payment of 40s. a year, with licence to empark and with liberty of free warren. The licence to empark almost certainly precludes the existence of a town at that period. Two years later, says Brayley, Gatton was empowered to return two members to Parliament, and it is not improbable that even this privilege was granted to Tymperley's services, although their precise nature is unknown. There is here no mention of a Charter of Incorporation or of the appointment or creation of mayor, aldermen, burgesses, bailiffs, or the usual essentials of a borough. Elections at a later period were conducted by a corporation elected annually in the customary form at the usual court of the manor. Therefore, although Gatton was spoken of as being a borough, I think it is fair to infer that it was never actually and legally constituted as such.

The first members in 1451 were Thomas Bentham and Hugo Hulls. I will not give you the whole list, but a few examples, which will show that the "rotten borough" so returned men of much the same class as other boroughs.

In 1558. Edward Slyfield, of Slyfield Manor, Great Ockham.

1553. In the first Parliament of Philip and Mary when that Thomas Copley was returned by the election of a lady to elect the member."

1586. John Puckering, serjeant-at-law, afterwards Speaker of the House of Commons.

1603. Sir Thomas Gresham, of Titsey Manor, and for many years of the Royal Exchange.

1625. Sir Thomas Carew, serjeant-at-law and Speaker of the House of Commons.

1702. Thomas Onslow, of West Clandon.

1812. Wm. Congreve, son of Sir William, the inventor of the rockets that bear his name.

And in 1831, the last members were John Saville, Viscount Pollington, eldest son of Lord Mexborough, and John Cooper, fourth son of the Earl of Shaftesbury.

The elections, according to local tradition, took place in what is called the town hall, a kind of Grecian temple.

d on six columns, almost hidden from sight in a clump of
outs and limes. Behind it is a large urn standing upon a
pedestal, on the four sides of which are these
inscriptions:—

"Comitium Gattoniense, 1765.

H.M. Dolus Malus Abesto."

"Stat ductis Sortibus Urna.

Salus populi Suprema Lex Esto."

It may be thus roughly translated:—"The Hustings of
Gatton, 1765." (Comitia—Roman legislative or elective
assembly.) "Let trickery and evil be far from us. The urn
stands though the lots are drawn. Let the well-being of
the people be the supreme law."

1765 implies the date of the erection of this structure it
is probably due to Sir Mark Wood, who was the then lord of
the manor.

That the initials H.M. may mean I cannot say.

It is to return to the succession of the lords of the manor.
Under what circumstances has not been traced, Gatton
is the property of the knightly family of Copley until
1765, when, on the death of Sir William Copley, it descended
to his granddaughters, Mary and Anne. Mary was married to
John Veston, of Sutton Place, near Guildford, and Gatton was
sold to them on a partition of the estates. They sold it to
John Turgis, who became one of its members in 1660. His
son succeeded him, and also represented Gatton in Parliament
1704, when he died s.p. He bequeathed the property to
his kinsman, William Newland, who, together with his
sons, also died s.p. George, the younger brother, Fellow
of Magdalen College, Oxford, and Professor of Geometry in
St. John's College, London, dying in 1749. The manor de-
scended to some female relatives of the Newland family, who
obtained an Act of Parliament for the sale of the estates in
1765, of Geo. II.

It was passed by sale from hand to hand until early in the
nineteenth century, when they were purchased by the trustees (during
the minority) of Frederick John, fifth Baron Monson. Born
1781, s.p. 1841.

It is the Lord Monson who commenced to build the
Hall, and who, in 1834, renovated and decorated the
interior. His remains rest in the mausoleum which he built
for himself a few years before his death. The place belonged
to the Monson family until 1890, when it became the property
of Mr. Jeremiah Colman, the present owner, who
renovated the Marble Hall as we now see it.

The church of Gatton is mentioned in Domesday Book,
1086, as being in the gift of the prior of St. Pancras Priory,
until the dissolution of that house. Since 1550 to the
time the advowson has been vested in the lords of the
manor. Of the structure Brayley says it is Anglo-Norman, and
there may still remain some foundations of the church
as recorded in Domesday, but he only adds that in 1834 it was
renovated by Lord Monson, of whose correct taste
and quality it presents an eminent example. The exterior is
well executed. Lord Monson sought far and wide for his
decorations. The wainscot and canopies of the nave
and stained glass are said to have come from the cathedral
at Chartres, Louvain; those of the chancel from Burgundy,
the communion-table and pulpit from Nuremberg (they are
said to have been designed by Albert Dürer). The com-
munion-rails came from Tongres, in Flanders; the stalls
belong to a Benedictine monastery at Ghent, the carved
work brought from Rouen, and at the west end of the
chancel a Gothic screen from an English church, bought by
Lord Monson, "after the more than asinine stupidity of a
man had consigned it to destruction." It is a fine
specimen of open carved work. In the west window are the
figures of Henry VII. of modern execution, and they are
very likely incorrect, as the supporters are depicted sitting
on haunches.

The name of Merstham has been variously spelt Mestham,
Merystham and Marstham; but the Domesday Book
says "Merstan is held of the Archbishop of Canterbury
by the monks." Major Heales, F.S.A., says it
is probably derived from the word *mere*—defined as a marsh-
y boggy swine walk—and *stan*—a stone or house of
stone. From the fact that Merstham was formerly noted for
its pottery it is probable that the last syllable should be "stan"
or "ham." So far back as the fourteenth century
Henry II. granted a patent to John and Thos. Prophete to
use here to be used in the construction of Windsor
Henry VII.'s Chapel in Westminster Abbey is almost
entirely of Merstham stone. And according to local
tradition the present London Bridge is said to have been built
of Merstham stone, conveyed thither by means of an early
tramway, known as the Surrey Iron Railway. It
was opened in 1801 and finished in 1805. It was a double
track, worked by horses and ran from Merstham and Croydon
to Wandsworth. It was constructed of iron
girders laid down in parallel lines in which the

wheels of the waggons ran. Eventually it was purchased by
the Brighton Railway Company.

The stone is a kind of firestone, soft when quarried, but
hardens by exposure to air. It stands great heat, and hence is
called firestone.

Merstham Church.

The earliest and chief part of the existing fabric is of the
end of the twelfth century. The west doorway has suffered
from severe cleaning, amounting almost to recutting about
twenty-five years ago. The dog-tooth is cut in a chamfer,
which is somewhat unusual. The lancet windows in the tower
are original, notwithstanding their modern appearance caused
by careless scraping.

The first bell is inscribed:—"Sancta Katharina ora pro
me."

The second:—"x Robertus x Mot x me x fecit x 1597 x."

The third:—"Bryan Eldridge made me 1643, Nicolas Best
and Rich Sharpe, Churchwardens."

The font is of Sussex marble and of Norman design, and
resembles one of the same period at Shere. The chancel arch
is similar to French work executed about the same time, and
its capitals bear sculptured foliage resembling acanthus leaves.

In the north chancel or chapel is an altar tomb bearing an
inscription which may be thus translated—"Here lies John
Elmbrigg, gent., who died the 8th day of Feby., 1473. And
Isabella, his wife, who was the daughter of Nich. Janys,
quondam Mayor and Alderman of London, who died 7th day
of Sept., 1472, and Anne, his wife, daughter of John Prophete,
who died — day of —, 14—."

There were three brasses of these persons, but that of the
husband, in the centre, is missing. Scrolls proceed from
them—"Sancta Trinitas," "Unus Deus," "Miserere Nobis."
Beneath is a brass showing seven daughters with butterfly
head-dresses, and on the right of this is the depression which
once contained a brass of the four sons.

In the middle chancel is a brass to "Thomas Elmbrigg,
Armiger, who died 27th March, 1507." A small brass to John
Newdigate, who died 21st Feb., 1498. Also one to "Peter
and Richard Best, sons of Nicholas Best, and Elizabeth, his
wife, of Alderstead, in the Parish of Merstham."

The father may have been the son of Nicholas Best, church-
warden, whose name is inscribed on one of the bells.

In the north chancel is also a curious life-size effigy of a
man attired in a long robe with a purse at his side. The face
has been roughly obliterated. This figure was found placed
face downwards, beneath the floor of the south chancel, when a
vault was being excavated for the interment of one of the
rectors.

Some have thought it to represent the Nicholas Janys,
mayor and alderman, mentioned on the Elmbrigg tomb.

THE GOVERNMENT ART SCHOOLS.

IN his last report Mr. S. J. Cartledge, the chief inspector,
writes:—

There are many excellences in the work of schools of
all kinds, but these, with this simple comment, can be left to
take care of themselves. Much of the elementary imitative
work would be strengthened and the students would learn to
draw with more freedom and boldness if "free arm" black-
board practice were more widely adopted. Some teachers
show timidity in introducing such practice, fearing that it may
lead to a lack of accuracy. But where concurrent practice in
accurate pencil, brush or pen drawing is followed, the danger
of unbridled freedom is non-existent. In geometrical drawing
the work is often slovenly and inaccurate, the points of contact of
curved with straight lines are indeterminate, angles are wrongly
plotted, and repeating patterns especially are vaguely constructed.
Sometimes it would appear that the student is left too much
alone with the text-book, without the necessary demonstration
or explanation of method. Blackboard drawing is sometimes
weak in the memory section, which is, in the few cases referred
to, a mere matter of cram from printed examples of flowers,
animals, common objects, &c., one view only of the subject
selected—that given in the text-book usually—being possible
to the student. Fewer students appear to be studying perspec-
tive drawing, and the weak point seems to be the inability to
understand the uses of geometrical plans and elevations, which
are so necessary in this subject. Shadows and reflections
should be more generally studied. In freehand drawing too
much preoccupation about the kind of line supposed to be
necessary to pass the examination appears. Distinct and
accurate representation of form should be the aim here. Model
and object drawing in the weaker schools shows much ignorance
of foreshortening, a kind of half-teaching about the "vanishing"
of lines appearing to satisfy the instructor in such schools. In
the study of light and shade there is a serious falling off.
Loose, sketchy, feeble work is seen in many schools. Though
the teachers have complained of the complexity and unsuit-

ability of the examples lately given in the Board of Education's examination in this subject, that is rather a reason for their seeing that the students study carefully from examples of simple form to secure their understanding the meaning and expression of "shadow," "shade," "half-shade," "reflection," "light," "half-light," "high light," &c. But in a large number of schools students are found working from the casts used in the examinations, to which the teachers have expressed objection. The study of architecture often shows too much reliance upon the text-book. Schools which have not an architectural museum or a good collection of architectural casts are often near admirable buildings to which the students should more often resort for study. The profiles of mouldings are not seldom practically ignored whilst an elaborate drawing of the enrichments of the mouldings is made. Studies of the human figure from the antique and the living model are curiously unequal. In many cases memory drawing from the living model is attempted before complete imitative study has been effected. It is obviously of little use to memorise an imperfect realisation. In the work from the antique this defect is not so apparent, and it may be due in the life work partly to insufficient opportunity of studying from the living model. In some schools such study is curtailed on account of the expense incurred in employing models. The study of anatomy calls for no special remark as to defects. In design the predominant weakness is a lack of thorough nature study. Too often a hasty drawing is made from a spray of natural foliage without careful research into the principles of growth, the beauties of contour and the more minute delicacies of form, and then a pretentious composition is imperfectly schemed by reference to this imperfect drawing. In some cases no study from nature is made, the details being annexed from one of the illustrated text-books on design. Though improvement is shown, lettering is still far from thoroughly studied in some schools. In figure compositions too little recourse to nature often betrays itself, and in the illustration of classical or legendary episodes an imperfect acquaintance with the myth or legend is apparent. Ornamental painting is too often mere cram for the examination in this subject. Still life painting would in some schools be better done if simpler groups were arranged and objects with little detail or pattern were used. The study of principles of ornament and historic ornament is frequently confined to text-book work, without reference to local buildings and museums. Modelling in all its branches often shows pupils working at subjects beyond their strength. This appears especially in figure studies in the round and in the higher branches of modelled design. The study of mouldings here appears often to be neglected or superficially followed. Students of modelled design who attempt subjects connected with architecture should have some knowledge of that subject, or at least of that part of it which is concerned with the details with which they are dealing in their designs, even if those details are only the mouldings of a panel or frieze. But the weakest point of all appears in the study of colour, which in many schools does not receive the degree of attention it requires.

Some schools neglect the preservation of the executed work of the students, which should be kept together each session for the inspector's examination in order that the progress of individual students may be gauged.

In the course of this report I have dwelt rather on faults than on merits, but it should be stated that the best work of the best schools was never better than it is to-day. And where effort is being made I think it is exerted with more energy and more intelligence than in the past. Therefore the outlook is hopeful, as the example of the efficient schools is bound in time to influence the weaker ones.

It is interesting to find here and there natives of other countries studying in our schools of art, as I have seen them in London, Manchester, Liverpool and other centres. In this connection Mr. FitzRoy says:—

"At Leicester Municipal School of Art I found a young French student, son of a Paris jeweller, sent from Paris to Leicester to take a two years' course to 'learn to draw and to design in the English way.' This appears to be some evidence of the appreciation of the work of English schools of art in France.

"At New Cross School of Art (Goldsmiths' Institute) I also found four students from Toronto, Canada, come over for a year's course."

The fact that the teacher is the dominant influence in the work of art education renders it fitting to refer again to the difficulties experienced by teachers in their arduous work. The position and qualifications of art teachers are often misunderstood. The training of the efficient art teacher gives him a sound knowledge of the history, principles and practice of various forms of art and the manipulation of their different materials of expression. But he has a more important qualification than these. He has a knowledge—one most difficult of attainment—of how instruction in the principles and practice of art is best conveyed to the students, who, as human material,

vary infinitely more in character and behaviour and are much more difficult of manipulation than the materials of practice art. The peculiar and special value of this expert educational knowledge in art is apparent when the failures are recalled that have been made in art education by men of eminence as producers. Until the special value of the educational qualifications of the art teacher is more generally realised, his duties will be performed in many instances under conditions of discouragement and want of appreciation which are not conducive to successful work. Sometimes a teacher has to struggle against difficulties in the way of bad premises and equipment without the nature of his disadvantages being in the least degree taken into account or even realised by his governors. An instance recently occurred in which some members of a governing body were not satisfied with the work of their art master, which they compared with that of a neighbouring school. It had not occurred to them until it was pointed out that their premises did not admit of some of the work successfully done at the neighbouring school being touched at all by their own, to say nothing of the cramped and unsuitable accommodation for most of the higher work, which is well provided for in the neighbouring institution.

When a school of art forms part of a large institution such as a polytechnic or a technical institute there are some instances of difficulties arising from the want of appreciation of those in authority of the means of keeping the machinery of art instruction up to date. Occasional friction arises in large institutions from the drafting of art students into other subjects of study, and the placing aside of the art master's authority over the art students. Happily such cases are rare.

In my last report I referred to the desirability of art teachers having opportunities of visits to foreign countries to see the life and work of other nations. I am glad to be able to report that some of the art masters have during 1902 taken advantage of foreign travel. Among these I may mention the head-master of an important school of art in Surrey who recently paid a voluntary visit to Spain, from which he derived much information on art matters that will be useful in his work, and through his instruction to the art education of the country at large.

The head-master of a school of art in Staffordshire was sent in the summer to Germany and Austria by the county council for the purpose of visiting the principal glass-making districts. As he is a practical artist in glass this visit could not fail to be of utility not only to him as a teacher but to the glass industry of the country, which will find profitable information in his excellent report to the technical instruction committee of the Staffordshire County Council. The practical suggestions made by him as the result of his impressions should commend themselves to other localities, which would do well to follow the example of Staffordshire County Council and send the masters of their schools of art to see what methods of teaching manufacture are adopted in similar localities abroad. The expenditure involved will be a sound investment through strengthening thereby of our national industries.

EXCAVATIONS AT NAUKRATIS.

A CORRESPONDENT of the *Times* writes:—How and why Naukratis was the one privileged colony of Greece in the Nile Delta under the Saite Pharaohs is known to every student of Herodotus. How its site came to be rediscovered in 1884 is known also to all who have followed the amazing record of Mr. Flinders Petrie's explorations from their own time. The excavations which he then set on foot, and Mr. E. Gardner and others continued, showed this site to be (as it indeed, to be expected) of a very singular character. The great trading cities of the Eastern Mediterranean seem to have poured their products into it, and to have combined the Egyptian influences to create and foster native industries whose output was of a curiously hybrid nature. West of the East co-operated in the decoration of the local pottery in the style of the local terra-cotta fabrics, and even the architecture of the local shrines. Naukratis must have been an exchange and mart of a very cosmopolitan kind. If nothing else testified to the fact, it might have been readily inferred from the multitude of balance-weights in many materials related to several standards which are strewn over the mound. And if ancient writers had not referred to the fastidious and sensual luxury of the place, the extraordinary abundance of the finest painted sherds of all contemporary fabrics, forming the great abundance of vessels dedicated to the goddess of love, and the abundance of indelicate plastic and decorative types, would have taught us to regard Naukratis as the home of a civilization as much Oriental as European. To the predominance of the Ionian element among its Greek population were also evidently others, notably Cypriote and Phœnician, which could not make for continence or frugality.

Side by side with the Mediterranean colonists lived, as we are now assured, in a distinct part of the town, a considerable Egyptian population, which had its own name for the place.

recognised the Greek designation. Both names have been written in hieroglyphic script together on a splendid papyrus-bundle which was dug up some four years ago in the heart of the southern desert. The spot, now cultivated and irrigated land belonging to Prince Hussein, lies in the middle of an area trenched by Mr. Petrie in 1884, and by him believed to be a Greek necropolis; but it is clear that it is purely Egyptian, the centre of a population which lived apart. Whether the Egyptian city existed there before the Greek suburb to the north was founded we do not yet know for certain; but it is not improbable that it did so precede Naukratis proper, and must be referred to the time of the founder of the Saite dynasty. Indeed, there is some reason to think that the subsequent invitation to Greek traders to settle beside it, and the grant of exclusive trading privileges, were precautionary measures. Amasis decided to bring into one spot in Egypt, where they could be garrisoned by a resident garrison, in easy communication with the neighbouring Sais, the scattered members of an enterprising foreign folk of useful commercial capacity but piratical instincts. As this folk was undoubtedly affected by contact with the Egyptians, so the latter must also have been affected by the Greeks. The interest of Naukratis is such that it has brought well to work the mounds over and over again in order to recover whatever significant remains antiquity may have left buried there.

The first object aimed at by all excavators of Naukratis has been the shrine, or group of shrines, rendered famous by Herodotus as the Hellenion, founded and controlled in common by the great Greek cities of the Asiatic coast. This may not have been part of that emporion, or exchange, of the same cities managed. As the oldest known instance of a Hellenic factory, such as the Italian maritime republics, the Portuguese, the Dutch and our own merchants were to establish later in *partibus infidelium*, this foundation by the Greeks of the sixth century B.C. in Egypt has a special interest. Mr. Petrie, looking for some large open space, such as might have been at once a great market and the precinct of a temple, thought he had found it at the end of the mounds, where an area comparatively free of debris was then surrounded wholly or in part by formidable walls of brickwork. But Mr. Petrie did not attach sufficient weight to negative evidence, which he himself supplied, to his failure to find Greek remains in this area, or anything pointing to an Hellenic temple, or to the positive fact that no Greek remains were found in and about it is almost exclusively of Egyptian origin. Furthermore, perhaps he jumped too hastily to the conclusion that here was one *temenos*, enclosed by a single wall, and that it was empty of any buildings other than a rack-like structure which he found in the southern half. Chance discoveries made since have demonstrated that there were other buildings there, and it seems clear that it was the heart of the Egyptian part of the town. In the case of it were Egyptian shrines, and round these rose masses of brick building to a considerable height, according to the growth of most cities, in which the level of the quarters rises steadily round the unalterable religious centres. Mecca supplies a good example. There the dome of the Great Mosque is now sunk below the streets and has become the receptacle for their flood drainage. The true site of the Hellenion was probably found fifteen feet higher at the other end of the mounds. This northern position is shown by an enormous preponderance of Greek remains, which represent the foreign quarter and the locality in which the shrines to Greek divinities were erected. Here Mr. Petrie had explored precincts sacred to Apollo, Hera and the Dioscuri. And here it was that, in 1899, a shrine of Aphrodite was found, forming part of a complex of buildings within a walled enclosure, among whose ruins occurred fragments of dedications to other divinities, and notably several inscribed to the "gods of the Hellenes." In the past spring exploration of this region, rendered possible by the low water throughout Egypt, has served to give definition to the area within which these curious dedications occur, and their number; and it is almost certain that this precinct must have contained a temple to the *Theoi Hellenioi*, or of small shrines dedicated to the worship of the Hellenic deities included under this category. To these shrines the Greeks were made separately or in common; and it is not possible to suppose that it was their shrines and precincts together that constituted the Hellenion.

The terrible ravages wrought by limeburners, by the climate and by the delta acting on structures of unbaked bricks and by the ladders for nitrous earth, have left little enough for an explorer to explore, and he must be content with hardly more than the almost indestructible potsherds which survive as once dedicated by pious patriots or lovers in the desert. These sherds are often of singular excellence, probably the finest fabrics of Hellas from the middle of the fifth century onwards, and extraordinarily representative of the work of the potters. In fact, a better collection of Greek potsherds for educational purposes could till lately be

made at Naukratis than on any other single site in the Hellenic world. To these, however, every explorer of Naukratis has been able to add a great number of votive terra-cottas, whether remains of single figures or of groups. Those found in 1899 in the shrine of Aphrodite within the Hellenion enclosure were particularly fine; those found during the latest excavations, inferior in quality, seem to pertain not to Aphrodite only, but to cults of Artemis and Herakles. Remains of sculpture in other materials have always been of rare occurrence at Naukratis, where the limeburner has been diligent; but this year has added several pieces to the plastic fragments we possess from this site in marble, stone and plaster.

Evidence accumulates that the town underwent at least one sack of a very drastic sort not long after its foundation. Structures, which are not of later date than the earlier part of the fifth century B.C., have earlier ones underlying them and separated by a thick belt of debris. Probably the deep trench found by Mr. Petrie in the precinct of Apollo, full of fragments of early vases, was cut when the time came to efface the marks of this cataclysm. Who sacked Naukratis? One thinks naturally of the Persian invasion and the maltreatment of the Delta by Cambyses. Herodotus says nothing of Cambyses in connection with this particular city; but there is no reason why he should have done so. A Persian sack was ancient history by the time Herodotus came to visit Naukratis, and all trace of it had probably been obliterated. It may be remarked in this connection that of his visit in the latter part of the fifth century B.C. a possible relic has come to light in the recent excavations, namely, the base of a painted vase inscribed "Herodotou." This vase was found within the Hellenion precinct; and seeing the comparative rarity of the name and the coincidence of the date of the vase, as judged by its fabric and the lettering of the dedication, with the probable epoch of the Halicarnassian's visit, one may be allowed to read on this offering an autograph of the father of history.

The exploration has been pushed this time to the very limits of the so-called mounds. The site of Naukratis is, from an archaeological point of view, done with. Stray potsherds may yet be reclaimed, and in the irrigated lands about the skirts of the site a monument may come to light from time to time; but there is no longer any scientific reason why the levelled and excavated area should be withheld from cultivation.

POLYTECHNIC CLASSES.

THE pioneer Polytechnic in Regent Street commenced its twenty-second class session on Monday evening, September 28. A visit to the auditorium of the Polytechnic on Monday evening last revealed a sight most encouraging, for hundreds of young men and women were to be seen paying their class fees for the winter session. Some idea of the extent of the educational work carried on in the Regent Street Polytechnic may be gathered from the fact that last session 14,400 students attended classes and nearly 15,000/ was paid in fees. Considerable successes are obtained every year by the students, and a few amongst many obtained last session were six National Competition medals and ten book prizes, fourteen City and Guilds silver and bronze medals and 23/ in money prizes, eighteen London County Council scholarships, fourteen University of London Inter. Science and three Inter. Art degree passes, and several students of the art schools had works exhibited in the Royal Academy exhibition. A special feature of the work is the comprehensive courses of instruction at nominal fees arranged to meet the requirements of various trades and professions. For instance, an excellent architectural and building trades course may be taken each evening for a period of seven months at a fee, including certain textbooks, of one guinea, and for this sum a student may attend, if he is so minded, classes every evening weekly in twenty subjects. For a sum of 12s. 6d. a mechanical science course ticket, admitting to classes in ten subjects appertaining to engineering, may be taken every evening weekly from September to May. Other equally advantageous courses at nominal fees may be had in electrical engineering, natural science, domestic economy, business training, in addition to the various day schools. Some 600 evening classes in 220 different subjects are held weekly. Altogether the Polytechnic may well anticipate another successful session.

Two Statues have been placed on the new west façade of Hereford Cathedral. They represent St. Ethelbert and St. Thomas of Hereford. They are partly reproductions of the mutilated effigy of King Ethelbert which is placed on a pedestal against the pier on the south side of the sacristy, and of the small figure of Sir Thomas de Cantelupe, which forms one of a group of mutilated figures over the tomb of Sir Peter de Grandison against the north wall of the lady chapel. They have been designed and executed by Mr. Fincher, sculptor, of Peterborough.

NOTES AND COMMENTS.

It is sometimes difficult to determine how far the amalgamation of two buildings, which separately and formerly complied with the London Building Act, changes their character and makes them subject to later amendments relating to new buildings. A knotty case of the kind came before the Tribunal of Appeal at the end of last week. The demand for instruction made it necessary to enlarge that useful institution, the City of London College. In 1894 that was attained by taking a house which was separated from the main building by a court, and connecting them by means of a bridge. The arrangement was then legal. It is now proposed to utilise a vacant warehouse in Ropemaker Street as an addition, and the question to be determined was how far the amendments of 1898 were applicable. Mr. E. WOODTHORPE, the district surveyor, raised the following objections:—(1) The roof should be made of fire-resisting material throughout; (2) the staircases in the building were not in accordance with the Act; (3) the uniting of the present City of London College (including the original building in 1883 and the addition of 1894) to the building proposed to be converted was objectionable, because the building, if united and considered one building, would not be in conformity with the Act at present in force (the London Building Act, 1894). The President of the Tribunal advised a compromise. The College authorities accordingly withdrew their appeal respecting the corridor communication, and the hearing was adjourned to enable the parties to agree upon a second means of escape in case of fire at the new premises, No. 9 Ropemaker Street, and also to agree upon the requirements necessary to make the building fire-resisting.

THE lectures to students of the Royal Academy will commence on Monday next with the course on chemistry by Professor CHURCH. The subjects will be similar to those of preceding years, with the exception that in the last lecture "Solid Oil-Colours" will be introduced. They will comprise:—"Grounds for Painting," "Composition and Classification of Pigments," "Tests and Trial of Pigments," "Selected and Restricted Palettes," "Vehicles and Varnishes" and "Methods of Painting." Professor THOMSON's course of twelve lectures on anatomy will begin on October 26 and will be completed on December 3. The subjects of the lectures on painting and sculpture will be afterwards announced. Professor AITCHISON's lectures will be devoted to "VITRUVIUS." The first will be given on February 29.

ILLUSTRATIONS.

CEILING OF CHAPEL, ROYAL MILITARY HOSPITAL, KILMAINHAM.

THIS structure, erected in 1680 from the design of Sir CHRISTOPHER WREN, in his capacity of surveyor of works to the Crown, possesses many features of interest, not the least of which is the ceiling of the chapel. The plasterwork is attributed to CIPRIANI, and is said to be not inferior to any similar work in the kingdom. The ceiling is of the same date as the structure, and the timber supporting it becoming defective through age, it was in danger of falling. Every effort was made to keep it in position, and the idea of conserving it was reluctantly abandoned. Examining the design critically, it may be regarded as a very interesting example of the plasterwork of the period rather than as possessing great artistic merit, as it is perhaps somewhat overloaded with ornament to be architecturally good. After much consideration the Board of Governors eventually approved of the scheme of reproducing it in its entirety in fibrous plaster by Messrs. JACKSON & SONS, 49 Rathbone Place, London, at a cost of about 1,800/. A portion of the old ceiling was preserved for the Museum of Science and Art in Kildare Street, Dublin. Careful photographs of the whole ceiling were taken by Messrs. CHANCELLOR & SONS, Dublin. In carrying out the work it was found possible to introduce the old scrollwork of the four panels across the old ceiling into the new fibrous plaster, and the old enriched relief work was secured to new ground. During the progress of removal it was found that the main cornice at the springing of the coved portions of the ceiling was defective, and this was renewed in timber with enrichments in plaster; the supporting brackets were secured to steel sections built into the walls. For the latter portion of

the work Messrs. T. R. SCOTT & Co., of Dublin, were employed at a cost of 186/. The painting of the ceiling was done by Messrs. JACKSON, at a cost of 210/. The following is an extract from the seventieth official report of the Board of Works, on whose professional advice the carrying out of the work devolved:—

In our sixty-ninth report we stated that after the close of the financial year 1900-01, in compliance with the direct order of His Excellency the Lord Lieutenant and His Royal Highness the Duke of Connaught, Master of the Royal Hospital, we have taken a deep interest in the subject, Messrs. JACKSON & SONS, Rathbone Place, London, a firm of much experience in such problems, had been consulted, and that after careful examination they had reported that the ceiling was totally unsafe and that permanent conservation was impracticable. We here only repeat the principal points of their report, viz:—(1) The key of the stucco plaster has almost gone in places, owing to disintegration and the enormous weight of the ceiling. (2) The laths, on to which the plaster is keyed, are in a bad condition. (3) The greater part of the timbers to which the laths and ceiling are fixed is in a very unsafe condition owing to decay of the outer surface of parts of the wood appearing to be rotten, but the interior being decayed. In the light of this report of those already received, the whole question was considered anew with a view to deciding which of the possible courses should be followed:—1. To endeavour to repair the ceiling. 2. To erect a new ceiling on similar lines and of improved architectural character as proposed by Thomas Drew. 3. To erect as close as possible a reproduction of the existing ceiling.

Having consulted the Irish Government and the Governor of the Hospital, your lordships were pleased to direct that the third course should be followed, and accordingly, with the approval of the Board, a contract has been entered into with Messrs. JACKSON & SONS for the construction and erection of as close a reproduction of the existing ceiling as possible, but in a lighter material. Advantage has been taken of the false ceiling put up by the Board, and Messrs. JACKSON have removed to London all portions of the ceiling they require for the purposes of reproduction. One portion will be reserved for the museum of the department of agriculture and technical instruction. The remainder of the ceiling has been demolished. The work of reproduction is going on in Messrs. JACKSON's shops, the Board's officers will prepare the necessary drawings of the work of the ceiling. Complete photographs were taken of the ceiling was touched. It only remains to say that the information obtained during the removal and demolition of the ceiling has shown that the decision against attempting to repair and maintain it was a wise one, but it may be possible to work a small portion of the old into the new ceiling.

The reproduction of the old ceiling has been carried out with thorough success.

BROWN HALL, OXFORD.

THIS illustration shows the upper part of the staircase as seen from the loggia. It is approached directly from a large central hall. The materials used were American whitewood, the arcade in Sirapite plaster; the trellis risers are of teak. The work was executed by Messrs. MESSOM & SONS, Twickenham, under the designs of FREDERICK G. KNIGHT, architect.

EMMANUEL CHURCH, STOUGHTON, NEAR GUILDFORD.

THE above church is for a new parish cut out of the district of Stoke-next-Guildford. It will be built in portions as the funds permit. The portion now erected and opened is the chancel, vestries, heating-chamber, and three eastern bays of the nave and aisles, and the lower portions of the tower. The walls are built of brick, and externally with Bargate stone, and plastered internally. The whole of the dressings, both internally and externally, the arcades are of Bath stone. The roofs are all of timber construction, unstained and unvarnished. The floors are laid with wood blocks, except the passage to the chancel, which are tiled. The screen between the chancel and choir vestry is of oak, traceried, and with upper part glazed with lead light glazing. All the doors are of oak, and the windows are glazed with lead light. The western end of the nave and aisles is filled in with temporary brick wall, and there are two temporary porches at this end. The cost of the portion erected, including the roads and gates, has been about 4,800/. The builders were Messrs. WEBSTER & CANNON, of Aylesbury, and the architect, Mr. W. GILLBEE SCOTT, F.R.I.B.A., 25 Bedford Row, London, W.C.

PEACE AND PORTRAITS.

the course of his reign the troops of Napoleon were able to enter Rome, Madrid, Naples, Vienna and Berlin, besides other capitals. He succeeded in reaching Moscow, and the feat was only considered to be preparatory to his arrival in London, which was to be the crowning effort of his power. But the campaign began on his return, and when he arrived in Vienna he was treated by Metternich as that worse kind of bankrupt—commander without an army. Abdication followed, and a fortnight after the event a convention was signed by which the empire was diminished to the area it occupied on January 1, 1814. About a year after he surrendered his authority Napoleon was exiled from Elba. There were a hundred days of Imperialism, followed by a new collapse at Waterloo. The allies took possession of France. The works of art which had been pillaged were returned, but there was no destruction of architectural monuments like the Bridge of Jéna, although they were considered as trophies to the conquerors. The indemnities which had to be paid amounted to about twelve hundred millions of francs, and it was necessary to provide for the presence of 150,000 foreign troops during five years.

It was not the desire of England to subject France to unnecessary humiliation. Frenchmen believed then, and some still believe, that all their disasters were to be traced to English interference. There were, however, many Englishmen who were favourable to France, for they looked on the Revolution as an attempt to free the country from intolerable evils. The English interest in the long war were, as Lord Eldon said, "all that she had not lost;" in other words, safety alone dictated the contest. An effort was therefore made to remove before the appointed day the Army of Observation which had been placed under the control of Wellington. Diplomacy at length succeeded in arranging a congress, which was held in Aix-la-Chapelle in November 1818. The Emperors of Russia and Austria, the King of Prussia and plenipotentiaries from France and Great Britain attended. It was agreed that all foreign troops should be withdrawn from France, and easy terms were granted for the payment of the sums due to the allies.

At the Congress was the final incident in the great war, when the Prince Regent resolved to signalise the treaty by having portraits painted of the principal parties who took part in it. For that purpose Sir Thomas Lawrence was appointed to paint at Aix-la-Chapelle. He had already produced portraits of some of the statesmen and commanders who were engaged in the preceding events. Lawrence was essentially a portrait painter, and he was only twenty-three when, on the recommendation of Reynolds, he was appointed painter-in-ordinary to the King. The terms on which he undertook the foreign mission were not extravagant. He was to be paid no more than his usual prices for the portraits, with 1,000*l.* for travelling and other expenses. The honour counted for much in the transaction. His highest prices were for a head or three-quarters, 300*l.*; a kit-cat, 315*l.*; a half-length, 420*l.*; a bishop's half-length, 525*l.*; a full-length, 630*l.*; an extra full-length, 735*l.*

As it was feared accommodation would not be available in Aix-la-Chapelle, the Government decided to have a temporary building constructed which could be despatched to that city. It provided one room which measured 50 feet by 18 feet, another of 20 feet by 18 feet, and a third of 18 feet by 12 feet. Filled with canvases it was shipped on October 3, Sir Thomas Lawrence having left on September 29. But, as is usual whenever officials have charge of arrangements, the studio and materials did not arrive until the time for their use had passed. Fortunately the authorities of the city rescued the artist from his difficulty by allowing the large hall of the Hôtel de Ville to be fitted up as a painting-room. It is a rare event for a painter to have several imperial and royal subjects at the same time, besides statesmen, warriors, and others. The letters which Lawrence wrote to his friends are interesting, but like much else relating to the war have been neglected. The Emperor of Russia was taken in hand. The painter usually drew a countenance in outline on canvas before using colour, but in this case he made a separate drawing, as the Emperor was likely to be busy with other affairs. For it he gave two sittings and, says Lawrence, "informed me of the exact duration of his stay with his armies, adding that he would give me other sittings on his

return." He next described his meeting with the Emperor of Austria:—

"A few days after the departure of the Emperor of Russia after making due inquiries as to the number and length of sittings, the Emperor of Austria condescended to fix a day for his coming, and punctually at the hour I had the honour of receiving him in my new painting-room; and the result has been that, from the first sitting to the last completion of the likeness (for it is finished), I entirely succeeded. I may truly and accurately say, to the delight of his officers and attendants and of numbers of the people of Aix-la-Chapelle, by whom he is exceedingly beloved, crowds lining the terrace and the hall of the Hôtel de Ville on his departure and shouting forth the enthusiasm of the heart for their former sovereign. Yesterday was his sixth sitting, and he sits to me once more for the hand, the face being entirely completed. I had some difficulties to encounter. His countenance is rather long and thin, and when grave is grave to melancholy, but when he speaks benevolence itself lights it up with the most agreeable expressions and making it the perfect image of a good mind. He lives in all the state of imperial majesty, with splendid state equipages, &c., and of right takes precedence of Russia."

We then learn more about the Emperor of Russia:—

"This morning I had the honour of receiving the Emperor of Russia, who came in the uniform he wore at the battle of Leipzig. He is a man of business, and I felt that, come when he would, it would be a sacrifice of time. He sat to me for an hour and three-quarters and appointed to come again the day after to-morrow, and I had faintly painted in the head from the drawing. The sitting, though the first, advanced the portrait considerably and successfully. I have no fear of the result. He saw my pictures of the Prince Regent, Blücher, Platoff, &c., for the first time, and with them that of the Emperor of Austria and the portraits of the Ministers, Prince Hardenberg, Metternich, Count Nesselrode, with all of which he seemed greatly pleased. He is still a subject of great interest and eager curiosity. The landing-places of the stairs, the halls and terraces are lined with respectable people of the place, strangers, &c."

The Emperor surprised the painter by fixing the easel on one occasion and lifting his portrait to it in order to allow of discussion. Lawrence considered by the incident he was elevated to the rank of Titian, whose pencil was raised from the ground by Charles V. The King of Prussia and the Emperor of Austria were likewise courteous:—

"The King of Prussia returns here to-night. His sitting and the Duc de Richelieu (a fine subject for the pencil) will complete my list at this place, for neither the Russian nor Austrian generals are at Aix-la-Chapelle. The weather is delightful; my faithful servant Holman fags for me with hearty zeal, and disdain of labour and hours. I am in my painting-room by half-past eight after breakfast, and between nine and ten the fine Prussian band march into the grand place, and enliven the brightest morning with fine airs and marches, some of which I have heard before, particularly an English air, which probably you may remember, of 'God save Great George our King,' and which they play with many charming variations. Have you had enough of me? I suppose the Emperor of Austria has, for he told the Duke of Wellington the other day that on that morning I had been in very good-humour—I had let him off for two hours.' At least this informs you of the good humour of the speaker."

A few days afterwards Lawrence found it necessary to make a change in the pose of the Russian emperor, and the result is described in the following letters:—

"I had to act decidedly against his judgment and wishes, and to make a total alteration in the picture, changing entirely the action of the legs, and consequently of the trunk. You will readily imagine that, circumstanced as I am, I work with the utmost vigilance of eye—I never exerted this with more certain effect than in drawing in that very action. The process was new to the Emperor, and the accuracy with which it was done surprised and pleased him. All seeing in it an unusual action of His Majesty, gave it their unanimous approbation, and I only on the day after saw its defect, and at all hazards determined to amend it. He stands always resting on one leg—(you know what I mean: the other loose on the ground, like the figures of the antique), and he stands either with his hat in his hand, or with his hands closely knit before him. The first figure was thus. You perceive that he here seems to be shrinking and retiring from the object of his contemplation, determining at the same time to preserve and hold fast one certain good from the enemy, whatever be the issue of the battle. These were my objections, and the vexatious thing was that before an audience of his friends, I was to commence the alteration by giving him four legs, and though gradually

obliterating the two first, still their agreeable lines were remaining in most complicated confusion. What I expected took place: during almost the whole of it the attendant generals complained, and the Emperor, though confiding in my opinion, was still dissatisfied. However, I accomplished the alteration, and the vessel righted. . . .

"There has been but little of that gaiety that you might have expected here from the meeting of so many illustrious personages. A few concerts (at which Catalani sung more miraculously than ever), and I think but two balls. The first was over before my arrival; the other I saw, in which the three sovereigns danced the Polonaise, or rather walked it, with several ladies, beginning with either Lady Castlereagh or the Princess of Tour and Taxis (sister of the late Queen of Prussia). There were an infinite abundance of stars and diamonds, and a deficiency of beauty. Lord Castlereagh was by much the handsomest man in the room, although there is great nobleness in the upper part of the countenance of the Emperor of Russia. The Emperor Francis has a face, when speaking, of benevolence itself, and that expression I have been happy enough to catch. The King of Prussia is taller than either, but with more reserve of manner. He has good features, and is of a sincere and generous nature. The Princess of Tour and Taxis has a very fine figure and manner.

"On Tuesday last I had the honour of receiving, in the entrance hall of the Maison de Ville the Empress-Dowager of Russia, and of accompanying her up to my painting-room, where I had the happiness of witnessing her delight on seeing the portrait of the Emperor, and of receiving from her the fullest and frequently repeated testimonies of her approbation in sentiments that I will not trust to paper. I think that relatively to my professional life it was the happiest and proudest day I have ever known, the Emperor, who had returned but the night before from Brussels, having visited me in the morning just as he was setting off again, and honoured me (being entirely alone) with the most gracious and flattering conversation, at the close of it firmly holding and pressing my hand for many minutes.

"The Emperor has commanded me to paint a copy of it for the Empress-Dowager—(you should have witnessed her apprehensions, frequently uttered, lest it should not be as identically her son as the original picture)—a copy of the Emperor Francis, of the King of Prussia, of the Prince Regent, and, in the garter robes, of the Duke of Wellington.

"The King of Prussia has commanded a copy of his own portrait for Berlin, and of the two Emperors and of the Prince Regent, in military dress. The ministers, in whose portraits I have equally succeeded, all request copies of them—Prince Hardenberg, Prince Metternich, Count Nesselrode and the Duc de Richelieu. Prince Hardenberg (the old Chancellor) through General Woronzow (son of the late ambassador), who attended the Empress, informed me, when with her, that Count A. was charged with a message to me from the Emperor, and the next day he came with the general, presenting me, from his Imperial Majesty, with a superb diamond ring. On my dining with Prince Hardenberg, His Highness presented me with another from the King of Prussia, with his initials in the centre, accompanied with a most gracious message.

"My professional intercourse with the Emperor Francis is not terminated. I have again to paint him, and am just setting off to Vienna for that purpose, and (to complete the general plan of the Prince Regent) to paint the portrait of Prince Schwarzenburg, who, as you know, was generalissimo of the armies in the last campaigns against France. The Emperor Francis has promised a copy of his portrait for the Town House of Aix-la-Chapelle.

"Providence has enabled me to give the fullest exertions of my faculties to this arduous business, and a coincidence of rare circumstances has given a professional distinction to it that has never yet occurred. Sent here by royal command, the magistrates of an imperial city, in which for centuries the Emperor has been crowned, granted me the principal gallery of the Town House for my painting-room, and to this the three greatest monarchs in recent political importance have condescended to come to be painted by me—the Emperor Francis sitting to me seven times, the Emperor Alexander (including two for a drawing) seven times, and the King of Prussia six; the average time in each sitting being two hours, and in the result, and even during progress, my exertions being accompanied and crowned with the most complete success."

The foreign employment must have been agreeable to Lawrence for another reason, it allowed him a respite from the daily and hourly demands of usurers. There was never a more improvident painter. Although in the receipt of large sums from his portraits he was always borrowing, and interest was piled up against him with that expedition which to outsiders is incredible. He was often unable, owing to the clamours of creditors, to find an hour for painting during the day, and it

was only at night by the aid of a collection of oil lamps that work was got through. In Germany he was able to have temporary enjoyment of freedom, and the following description of Heidelberg suggests that under novel circumstances a courtier became the student:—

"Of all the grandly romantic spots by nature, art, or interesting circumstances that I ever saw, or that I think exist, Heidelberg is the first. On the heights overlooking the university stands a castle—a dream, a relic of Ariosto, left him to be once seen by Lord Byron and Walter Scott, both this case having a right to the grand vision.

'Towers and battlements he sees
Bosom'd deep in tufted trees,'

excites no image half so magnificent. It is all ruins, but of so gorgeous a nature—and then so various—part of it is a vast mass of rocks, then instantly contrasting with another mass, encrusted with embellishments of architecture and sculpture between each window, of which there stand tiers of dukes, lords and knights in richest armour, with all the highly-wrought grotesque accompaniments of the thirteenth and fourteenth centuries. Then again come the massive square walls, of seemingly impregnable defence, with round towers and more intricate structures for offensive warfare, and round them all, outermost walls of amplest extent, and still existing remains of hanging gardens of Babylon, and a keep of tremendous depth and a fallen tower, that discloses the small stairs of the more dreadful depth beneath. A nearer approach to the town from a fine bridge, with statues uniting at a small distance with the magnificent forms I have mentioned (all of which overhang the town on a great height) is equally picturesque, though of another character. Then students meeting you in every street in dresses like those of Andrea del Sarto and the Florentines of Michel Angelo's time, all of them with port-feuilles under their arms, seem to bring forward in daylight vision another and the most interesting of that painters can languish to have known."

Although retreat from financial difficulties was permitted, Lawrence was too well aware that sooner or later the chase had to be resumed. The journey to Vienna was not in the programme when he started, and the Prince Regent had given further directions for portraits of the Pope and Cardinal Gonsalvi, which necessitated a journey to Rome. Every painter is eager to visit Italy, but Lawrence admitted that he had certainly less pleasure in the anticipation of such a climb to his mission than he ought. He wished to have a postponement of the extended journey, but it was suggested to him that the least hint of his desire might ruin him with his patron, the Prince Regent. At length he accepted the inevitable. Lawrence arrived in Rome in May 1819, and like many other travellers he was at first disappointed. Afterwards his eyes were opened to the importance of the buildings and paintings. One of his letters to Joseph Farington, R.A., expressed his views about Michel Angelo and Raphael:—

"I have already been often at St. Peter's and the Vatican, and for many hours each time. The latter I determined to see alone. Hereafter we shall have many a talk on the comparative merits of the two great men. Yesterday I dined at half-past one that I might remain till night in the Sistine Chapel and the Vatican, or rather in the chambers of Raphael, for, as you know, the former is part of the immense building. It often happens that first impressions are the truest—change and change and then return to them again. I try to bring my mind in all the humility of truth when estimating myself the powers of Michel Angelo and Raphael, and again against the former 'bears down upon it,' to borrow a strong impression, 'with the compacted force of lightning.' The diffusion of truth and elegance and often grandeur cannot support itself against the compression of the sublime. There is something in that lofty abstraction; in those deities of intellect that people the Sistine Chapel, that converts the noblest personages of Raphael's drama into the audience of Michel Angelo, before whom you know that, equally with yourself, they would stand silent and awe-struck. Raphael never produced figures equal to the Adam and Eve of Michel Angelo—the latter is miserably given in Gavin Hamilton's print—all its fine proportions lost; though it is Milton's Eve, it is more the mother of mankind, and yet nothing is coarse or masculine, but all is elegance as lines of the finest flower. You seem to forsake humanity in surrendering Raphael, but God gave the command to increase and multiply before the Fall, and Michel Angelo's is the race that would then have been. But you must read Mr. Fuseli, his only critic. In both the Sistine Chapel and the rooms of Raphael all, in too many parts in them, is ruin and decay. At least it appears so to me, who was not sufficiently prepared for the ravages of neglect and time."

he relates how he obtained an order to go round the gallery over the cornice in the Sistine and was able to make a close inspection of the works. It enabled him to verify what was said by Reynolds in favour of Michel Angelo. "It was not used," he added, "to be presumptuous in my opinions about art, but in my own mind I think I know that Joshua Reynolds could not have had another opinion on the subject." The differences between the two great artists are explained by saying:—

Michel Angelo's line is often (I should say usually) severely drawn. Michel Angelo is often, and, in the highest degree, so in his forms and proportions—his Eve reaching at the end is an example of it, and, in dignified beauty, has never been equalled by Raphael, whilst the awful and appropriate simplicity of his tone, and that breadth of light and shadow, so finely described by Mr. Fuseli (I mean in his whole treatment of this noble work—a masterpiece of elevated criticism)—produce altogether an impression on the reason as well as the imagination, against which all the variety and beauty of the sometimes grandeur of Raphael contend in vain. It is not for against Achilles—you love him, but see that he must be so.

The effect of the scenery was to reveal Lawrence as a lover of landscape. The view from the Villa Pamphili of an evening is considered to be remarkable, for Monte Mario, St. Peter's, and in the furthest distance Soracte could be seen. He said he was struck by the extraordinary beauty of the scene with that undefined richness of delight which amounts almost to pain, formed, as it is, of many causes—thoughts of the past, of youth and of age, and absence, which, I think, when alone, the close of the day in the country always brings before us." But to us one of the most remarkable passages relating to Roman scenery is contained in a letter to Farington, in which we have the first tribute to the inherent greatness of Turner which time had still to give. Lawrence writes:—

Turner should come to Rome. His genius would here be clothed with materials and entirely congenial with it. It is the proof of its influence on my mind that, enchanted as I am, I am when I go out with the beauty of the hues and forms of the buildings—with the grandeur of some and the richness of the picturesque in the masses of the ordinary buildings of this city—I am perpetually reminded of his pencil, and I feel the sincerest regret that his powers should not be excited to their utmost force. He has an elegance and often a greatness of invention that wants a scene like this for its free expansion, whilst the subtle harmony of this atmosphere, that wraps everything in its own milky sweetness—for it is colourless compared with the skies of France and England, and more delicate than the small Claude of Mr. Angerstein's and Lord Egremont's, though the latter has a slight tendency—has it not?—its softness—this blending, I say, of earth and heaven—can be rendered, according to my belief, by the beauty of his painting. I must already have written the substance of this to you, as I have to Lysons, but my dwelling on the subject arises from no affectation or assumed feeling. It is a fact that the pictures and scenes around me do thus impress themselves on me, and that Turner is always associated with them; and, though frequently, not so often, and Gaspar Poussin is less. You perceive my dread of displeasing you by the mention of another name, yet the sweetness of his colour is nearer than Gaspar and his composition is often finer. As a man of distinguished genius, and therefore worthy of the affection and admiration of his pupil. I seem to do justice to Mr. Callcott by not mentioning him as an artist less worthy of the enjoyment of this scene, but I think he is generally ready to yield the palm to Mr. Turner, and therefore will not be offended at the exclusive preference that you have shown."

It should be remembered that in 1819, when Lawrence was returning from Rome, Turner was still, according to Mr. Ruskin, in his first manner. It is doubtful whether he had then visited Italy. He was in Switzerland, and the *Gardens of the Apennines* is evidence that he saw the south, but through the haze as it were, of Nicolas Poussin. He acted on Lawrence's suggestion, for in 1820 he exhibited a view of *Rome from the Campidoglio*, which Mr. Ruskin described as little more than a collection of materials. The following year there was nothing, but a notable pause; in 1822 a small picture, and in 1823 came *Day of Bala*, which, according to the eulogist, "is encumbered with material; it contains ten times as much as is necessary to a good picture, and yet is so crude in colour as to be unfinished." Lawrence's foresight was, however, soon to be justified.

The business for which the painter went to Rome was not, however, to be neglected for studies of scenery and paintings. Pius VII., whose portrait he was to paint, was an effective agent in the downfall of Napoleon, for his meekness under brutal treatment revealed the extent to which physical force was to be carried wherever the French prevailed. There could not be found a worse example of French vulgarity than the Emperor. Lawrence has described his first interview with the Pope:—

"I was introduced into a small closet, in which the Pope sat, behind the opening of the door, and after bending the knee was left alone with him. He has a fine countenance—stoops a little—with firm yet sweet-toned voice, and, as I believe, is within a year or two of eighty, and through all the storms of the past he retains the jet black of his hair. I remained with him, I think, between seven and ten minutes, during which time he held my hand with a gentle pressure, from which I did not think it respectful to withdraw it. With a phrase or two of French (which he does not like to speak), and the rest in Italian, he spoke his sense of the Prince Regent's attention to him, and his gladness to gratify his wish, accompanying it with compliments to me. I then defectively expressed my gratitude and reverence, bent to kiss his hand, and retired."

The Pope sat about ten times, and the portrait is considered by some to be the most effective of the series. Lawrence also painted the portrait of Gonsalvi, the Secretary of State. The artist considered they munificently provided for him in Rome. Delightful apartments were prepared for him, with servants and a carriage.

The whole series can be seen in the Waterloo Gallery of Windsor Castle, and forms the most important historical collection in the country. They are as follows:—Duc de Richelieu, General Overoff, Duke of Cambridge, Earl of Liverpool, George IV., Viscount Castlereagh, Baron Humboldt, George Canning, Earl Bathurst, Count Münster, Cardinal Gonsalvi, Prince Hardenberg, Frederick William III., King of Prussia; Emperor Francis II., Emperor Alexander I., Count Nesselrode, Pius VII., Count Capo d'Istria, Prince Metternich, Charles X., Prince Schwarzenburg, Archduke Charles, Sir Thomas Picton, Duc d'Angoulême, Duke of Brunswick, Leopold I., Mr. Herman Platoff, Duke of Wellington, Prince Blücher, Marquis of Anglesea, Count Czernitshoff, Prince of Orange. Dr. Waagen, in criticising them, said:—

"Among so great a number of portraits all cannot be equal in merit. I was particularly pleased with those of the Pope, Cardinal Gonsalvi and the Emperor of Austria. Besides the graceful and unaffected design, the clear and brilliant colouring, which are peculiar to Lawrence, these are distinguished by greater truth of character and a more animated expression than is generally met with in his pictures."

There are a few portraits in the Waterloo Gallery which were painted by other artists, and it is possible some of those mentioned above are not properly ascribed to Lawrence.

The success of the paintings was not without effect on George IV. As soon as he ascended the throne he resolved to have similar portraits by Lawrence of subjects who were the principal representatives of science and literature. Walter Scott was to come first. There was much difference of opinion about his portrait when completed. Lockhart saw there was a neglect of proportion which diminished the majestic effect of the head with its mighty pile of forehead. But the genial Scott was delighted with it. After his last sitting he wrote:—"I ended this morning my sittings to Lawrence, and am heartily sorry there should be another picture of me except that which he has finished. The person is remarkably like, and conveys the idea of the stout, blunt carle that cares for few things and fears nothing."

Before he returned from the Continent, Sir Thomas Lawrence was elected President of the Royal Academy in succession to Benjamin West. He enjoyed the dignity for ten years, and died on January 7, 1830, in his sixty-first year.

The Citizens of Ballarat, Australia, have decided to erect a statue to the memory of the troops who fought in the South African war. The statue is to be equestrian, in bronze, and the cost will not exceed 1,300*l.* delivered in Melbourne. The pedestal is to be constructed locally. Designs are being received by the Agent-General for Victoria for transmission to the committee.

STANDARDS OF SIZE, QUALITY AND STRENGTH, IN RELATION TO BUILDING CONTRACTS.*

DURING the hearing of a law case in a neighbouring State recently, the learned judge held that "best quality" of materials and workmanship, when specified for a cottage, required the use of as good material and finish as when specified for a mansion. Although the question of materials and workmanship was but a small item in the case the ruling is important, and shows a danger to architects and builders, inasmuch as other judges may rule similarly, and cause loss of money and lowering of their good name to men who are conscientiously working under the usual business interpretation of the terms.

For some time I have foreseen this legal difficulty, and about 1894 read a paper before this Institute in which I suggested the adoption of definite standards of quality, both of material and finish, standards about which no practical men would disagree. The Institute recognised the importance of the subject by appointing a committee, but the financial crisis of that time and other causes claimed so much attention that the question was allowed to drop.

There are other and important considerations in addition to the legal. The architect's work has an art side as well as a business. The conditions of art productions are interfered with by business worry and disputes on details, most of which could be avoided. Sometimes special artistic power is found in young practitioners, but their clients suffer from their lack of experience, and get poor execution of the work, and the profession, as a whole, is blamed. We should all gain if the business details could be standardised, just as the legal details are standardised in our conditions of contract.

Architects generally specify materials and workmanship to be the best of their kind, although on many occasions good material and medium finish would be sufficient. Often good and substantial work is what is required; why not so specify? Personally, I frequently specify good and substantial.

Again, the standard of finish for some offices is lower than others, although the works may be similarly specified. We all know how much more highly we value recommendations from some offices than from others.

Further, I consider the present lack of standards causes loss of much work to the architect and builder, work which goes to the jerry-builder—so-called (would that we could deprive him of the ancient, honourable term builder and call him fraud).

He uses old bricks and bats, where he can cover them up by plaster, and mixes his mortar with garden soil and rubbish and spoil from the excavations. He uses indifferent hardwood for the roof and joisting-carrying plaster ceilings, and for ground-floor plates and sleepers and stumps, and is away out of reach when a few years later the roofs twist and leak, and the plaster falls, and the floors rot and sink. By the adoption of definite and lower, but substantial standards, I maintain that the straightforward architect and builder would get more work, and the standard of taste and health be improved, and loss to the building public would be prevented.

In our building contracts there are three parties—the proprietor, the architect and the contractor. All of these may be honest, or all or some may not. Our conditions of contract provide for the difficulties that may arise as to quantity and price of extra work, but leave the architect as the sole judge as to quality. A young or partisan architect may insist on an impossible standard of quality under the "best" clause and ruin the contractor; or a grasping proprietor may sue the architect and contractor for collusion because he does not get an impossible quality under the "best" clause, and a judge may endorse his view. The only business way is to arrange standards of quality, state them in the specification, and do our work without danger of the costly interference of the law courts.

In addition to the question of quality, there are questions as to sizes. The timber-yards quote for nominal sizes, as distinguished from full cut, and we all know how nominal some stock sizes and gauges are in G.I., and the tendency to hide them under the indefinite term ordinary.

Strength (with which is associated permanence) is too much regarded as a private matter. Building regulations, city and suburban, settle the thickness of brick and stone walls, but little or no account is taken of the use of old or second-hand materials, or weak or improper materials. The Government, for a fee, guarantees a secure title for the land when paid for and the local authorities collect fees for the building, but there being little or no check upon the use of old or insufficiently strong material, the buyer from the "jerry fraud" suffers in the end and the local handy man flourishes. Standards of load and strength are largely insisted upon in America, and some should be required here.

* A paper read by Mr. Anketell Henderson, P.P., M.C.E., at the meeting of the Royal Victorian Institute of Architects.

As to sizes there should be a distinct understanding of what is meant. In timbers an agreement as to stock sizes does not mean what is to be allowed for sawing out of stock sizes. A joinery, floorings, linings, &c., should they be quoted, finished sizes or not? As to G.I., the question, full size or nominal size, and true gauge. Similarly for other materials, nominal weight, &c., where they differ from actual, should be noted, as in lead and glass. I have met nominal 4 lbs. lead that weighed $3\frac{1}{4}$ lbs., and if all the materials of a building were of equally nominal size, the life of the building would be shortened. There are many difficulties as to standards of size, including weight, that are not easily overcome. All that is wanted is distinct understandings beforehand between client and architect and builder. These could be printed upon a slip, to be pasted on to the specification or inside the cover.

Most of the difficulties hinge round standards of quality. I have consulted with leading builders, and while foreseeing practical difficulties in applying the standards and settling disputes, they see little difficulty in settling the standards. Assuming the words medium, good, best and special to be taken as standard terms, I have never had difficulty in judging with any disinterested practical man I have met. One standard may be specified for material and another for finish (say, plastering, best material and medium finish), but that is easily understood and priced. One can hardly expect best finish of medium material, and the material would generally be specified higher class than the finish. The standards would occasionally have to be amended, owing to variation of quality of material obtainable in the market. For example, forests unfortunately thin out, and then smaller trees are used, and the timber is inferior and less matured and permanent. The architect who would try to judge present deals by a standard of twenty or even fifteen years ago would be sadly out.

In view of the enormous amount of jerry building, I think a standard of "quality of building" is necessary. This involves questions of materials and strength. A man when building should state on a form whether he intends to use best brick, second, or old; whether lime or cement concrete for foundations and the size thereof, and whether clean sand or soil; the nature of damp-proof course. Ceilings, whether wood or plaster, and if the latter, whether hardwood joists or Oregon, also the sizes of timbers and the spans. All the covering work should be described, and a purchaser be entitled to this statement at the building surveyor's, and have certificate as to the execution of work. Extra inspection would be necessary, but the man who proposes to use inferior material should be charged an extra fee, as his work may endanger health, and certainly endangers pockets.

Buildings should be classed according to probability of permanence, as shown by the quality of materials and the size of materials in proportion to their load.

Prices are allied to sizes and quality. The contractor should not be deprived of profit where he provides the money for work, and he is always entitled to discount for cash, as the proprietor's interests are protected by the retention money.

The essence of contracting is to obtain a choice of the lowest tenderers, but the architect has a right to choose trusted experts or dealers for special work and obtain their prices. The contractor, who runs no risk of loss in these prices, has a right to charge a less commission upon them if he likes, and that charge should be made to the proprietor through the contract, and should be declared fraudulent if claimed from a trusted expert or dealer. Cases have been reported to the Institute in which the trusted expert or dealer has been threatened with boycott unless he paid full commission to the contractor. This point should be settled between our Institute and the Master Builders' Association.

Strength, to which is allied permanence, involves elastic resistance of walls, arches, vaults, &c., the elastic resistance of metals and timbers and the chemical and physical resistance to decay. These qualities may overlap; for example, by building walls in cement mortar you render them capable of elastic resistance, as well as static.

As to walls, the public are well protected where there are building acts and regulations, but there are inexplicable differences in these, both as to principle and practice. In Melbourne and suburbs the sizes are based upon the area or cubic contents of the building and its height, and cases might arise in which walls that were not altered in height or length would yet have to be thickened because the area of the building was increased. The wall would have no more work to do, but still have to be thickened to comply with an old-fashioned regulation. This could not happen in England, or in any other colony or elsewhere that I know, because in these places the scientific principle of proportioning the thickness to the height and length of the wall is followed. Melbourne still follows the practice of London in 1844, a practice abandoned there in 1855. In some respects Melbourne is now more liberal in its requirements, in others less.

In respect to modern steel-framed structures Melbourne

hind. In New York and Chicago curtain walls, built in iron or steel columns and supported by girders and to them, are allowed to be about one-third the thickness. Room is thus gained and load on foundations lessened. Manhattan Life Insurance building, 241 feet high, has walls at top and 2 bricks at bottom. In most other Birmire states, 6 feet would be required at bottom.

I mentioned before, by building in cement mortar the ins the additional strength of elastic resistance. Those not contemplate steel-framed structures should, if they cement mortar, be allowed a reduction of thickness. inch extra thickness required for buildings exceeding cubic feet might be remitted in case of walls built in mortar, and instead of the $4\frac{1}{2}$ -inch extra required for two storeys below, it might be limited to every three

length of rafters, beams, columns, &c, forms no part of building acts, as in America, but it is inquired into only Public Health officers of this State in the case of public works. Complaint is made to this Institute that they are in recalculating stock forms of roof and other structures instead of adopting the common-sense standards of North, Tredgold, &c, and that they also recalculate girders, &c, instead of accepting the results of work given and guaranteed by firms of world-reputation. This should be stopped in the interests of economy and to save delay; and standards of strength and safety should be agreed upon and tables approved and issued for stock work, and common-sense be given to standard authorities.

so factors of safety there is much difference of opinion, and to want of scientific analysis and consideration. of safety is required to provide against—

foreseen defects of material and workmanship. possible inaccuracy of estimate of load, to say nothing of use of the building.

terioration of elastic resistance by repeated variation or alteration of stress or excessive load.

terioration by exposure to weather.

inside work No. 4 can be struck out, for external wood is vital. For Oregon used externally it would be more than for red gum or red deal.

(variability of load) is more important for the floor for the beams, and more important for the beams columns. Hence some American practice, which one factor of safety, and designs the columns for 7 per cent. and the beams for about 85 per cent. of the loads, and the joists for 100 per cent. Where the building is not likely to vary, or it is designed for a load, the factor may be low. I know of heavily-buildings in Melbourne with a factor of $2\frac{1}{4}$ to $2\frac{1}{2}$, but I do not advise less than 3 for special materials and work-

merica factors of safety and standards of weight on foundations and of pressure on concrete, and of brickwork, and strength of steel and loads on form part of nearly all building acts. Perusal of laws that practical scientific men are at work at them, even define the limits of deflection for some build-

LEEDS SCHOOL OF ART.

September 24 the class of design of the Leeds School of Art was opened with an address from the chairman, Mr. Wilson. He said:—

to congratulate your teacher, Mr. Musto, and your- in the occupation of these new buildings, which have admirably designed to meet your requirements, they are not to be formally opened until October 8, classes, as you are aware, commenced on Monday I have the pleasure to announce this evening the of the class of design, and on behalf of the Architectural Society and myself I wish you, Mr. Musto, and you, from the bottom of my heart every good wish in departure, which I trust will be long remembered as marking date in the calendar of your careers. Your ere this evening is strong presumptive evidence of being elected to follow the profession of architecture. already spent some years of your youth at school, acquired by the observation of men and things and which has developed into an inclination towards study. The prospectus of architectural classes, variation of which Mr. Musto was kind enough to ask him, sets forth the several subjects in the y, intermediate and final courses for the examinations al Institute, which are now to be taught in this presume that those of you who have set these as your goal will, before entering upon the final ve already passed the preliminary and intermediate,

from which you will have acquired that valuable and necessary knowledge which should always precede any essay in individual effort.

The work of this class is intended to prepare you for Division I. in the final course, viz. Design. This subject calls for the "design of a building of moderate dimensions, or a portion of a more important edifice, to be made from particulars given. The drawings to comprise plans, elevations and section to a scale of 8 feet to the inch, some details to a large scale, with a sketch perspective." I know of no subject in the whole of the examinations which is calculated to test the knowledge which the student has gained from the previous subjects than this of design. The examiners allocate 350 out of the total of 1,000 marks given in the final course to design, the largest number for any other subject being 125 marks. The work of these classes will give you a further opportunity of testing your aptitude for the profession, and should you find the work uncongenial you can abandon its further pursuit.

I have long thought that pupilage should be preceded by some elementary training preparatory to an office career. Many architects who refuse to receive pupils as beginners would probably take them if they were well grounded, and in such cases the period of pupilage would obviously be shortened. A year or two spent in a school of architecture should enable a student to acquire at moderate cost the rudiments of his work before learning in an architect's office the practical details of his profession. Pupils are frequently unable to take advantage of the opportunities offered in an architect's office because they have not previously studied the elements of their work; consequently they are only beginning to learn something about architecture when their articles terminate. I cannot impress upon you, gentlemen, too strongly the responsibilities which rest upon you as students of this school during this its first session in these new buildings.

The committee of this Institute have equipped the several departments with a wealth of facilities previously unknown in connection with the drawing schools of Leeds. The Architectural Society have given their approval and support, more particularly in supplying visitors to your classes, and through their President, who is a member of the Statutory Board of Examiners, arranging for this city being one of the local centres for the preliminary and intermediate examinations. The libraries of this Institute, the Architectural Society and the city provide a fund of information bearing upon architectural history and work. I trust that your appreciation of these combined efforts will be shown by your signal success in the examinations, by the place you will take in the ranks of your profession, and the glory you will thus reflect upon your Alma Mater.

Ours has been defined as the most difficult of the visual fine arts, yet there is much less labour spent on learning architecture than there is on learning painting and sculpture, although the votaries of these fine arts commonly have more natural aptitude for their calling. We know the painful years students of painting and sculpture devote to getting the groundwork of their art, while from three to five years spent in an office, mostly tracing, is thought enough for an architect. Architecture has been said to be the art which so disposes and adorns the edifices raised by man, for whatsoever uses, that the sight of them may contribute to his mental health, power and pleasure. If you are to attain this high standard you will have to pay the penalty of sacrifice and put forth your greatest strength. Is it not true that we are none of us so good architects as to be able to work habitually beneath our strength? and yet there is not a building that I know of lately raised wherein it is not sufficiently evident that neither architect nor builder has done his best. It is the especial characteristic of modern work. All old work nearly has been hard work. It may be the hard work of children, of barbarians, of rustics; but it is always their utmost. Ours has as constantly the look of money's worth, of a stopping short wherever and whenever we can, of a lazy compliance with low conditions; never of a fair putting forth of our strength. Let us have done with this kind of work at once; cast off every temptation to it; do not let us degrade ourselves voluntarily, and then mutter and mourn over our shortcomings; let us confess our poverty or our parsimony, but not belie our human intellect.

It will be conceded that there is a due relationship and proportion between the height of a structure and the depth and strength of its foundations. If it is your ambition to build up an architectural reputation which, like a lofty campanile, shall soar above the mediocrity of its surroundings, then you must lay the foundations of your career deep and broad in the knowledge and practice of the science of building and in the art of architecture. For the height of your attainment will always be measured by the strength and solidity of its foundation.

Mr. Musto followed with a lecture on "The Study of Architectural Design: its Necessity and its Recompense." He remarked that young men starting their profession found no difficulty in taking up constructional work, but somehow he usually found that beyond that they had not gone. As time

went on he trusted they would find that they were increasingly looking at design and the artistic side of things. One of the great values of examination was that it formed a distinct object to work for. The subject of design did not appear in the intermediate programme at all. He had had to discourage young men from beginning the study of architectural design because they had not gone over the preliminary ground, but when once they had passed that preliminary ground the sooner young men got to work on thinking out actual design work the better. He advised students to visit old and new buildings, and in addition to measuring and sketching and analysing, he suggested that they should criticise and sum them up, and consider whether the things that they accepted they were fully justified in accepting, or whether it ought not to be possible here and there to improve upon them. Alluding to a letter which appeared recently in the *Yorkshire Post* from a lady, he said she complained bitterly that architects were most horrible people, who would not provide cupboards and several other things. Some of his friends asked him to look at the horrible letter, but he did not agree with them. He thought that lady was perfectly justified in her complaints. An architect who designed a house that had not enough cupboards and proper bathroom and wash-house arrangements, and proper facilities for carrying on household work, ought to become something different from what he was. Whatever houses that lady had met with, he thought they might assume that they were not designed by an architect at all. At any rate, whoever designed these houses could not have known his business to give her justification for her complaints. As to the rewards of architects, these were few and far between. The engineer and the contractor, and the secretary and anybody else, could get his name in the papers, and get presented to royalty, and get honours and baronetcies, but an architect had to live on his own innate appreciation of his art. The prospects of a man who had not only studied construction but detail and design work were perceptibly greater than those of a man who had done nothing but constructional and strictly practical work.

Mr. R. Wood and Mr. G. F. Bowman (vice-presidents of the Architectural Society) addressed some words of advice to the students, and the latter moved a vote of thanks to the lecturer.

Mr. R. P. Oglesby seconded and the Chairman supported the resolution, which was adopted.

A vote of thanks was afterwards passed to Mr. Butler Wilson for presiding.

MUSEUMS AND HISTORICAL STUDIES.

THE Senate of the London University has adopted, on the recommendation of the Extension Board, a scheme of study for a more advanced certificate. The object is to give special encouragement to the study of history with literature and art—or, shortly, the humanities. The scheme is designed to present a broad view of history in its largest aspects (treated not merely from the political point of view, but also from the economic, industrial and social points of view) with literature and art, so as to give a comprehensive presentation of the life of the people and of the forces moulding nations and communities. The course of work is so arranged that those untrained in classical literature and foreign languages and able only to give a limited time in the evenings to study may profit by it. In addition to attendance at lectures and classes the student will be required to undertake a definite course of private reading and to submit to the lecturer regular paper-work, either in the form of essays or answers to questions. Visits will also probably be arranged to museums and picture galleries illustrative of the periods dealt with in the lectures. Three sessions are to be devoted to the general study, and the work will probably divide itself into a session each for ancient, Mediaeval and modern times. It will not be possible in this limited period of time to do more than present a broad view of general truths, so as to show the great chains of events and decisive movements which have determined the course of history. The student will also be required to undertake a session's work in the fundamental principles of evidence and reasoning, which may be either carried on concurrently with the history work in one of the three sessions or may be taken independently in another session. The course will deal on the one hand with the mode of discovery and establishment of some of the great scientific generalisations in one or more departments of natural science, and on the other hand with the method of estimating evidence in some other department such as law, so as to afford some insight into the principles on which evidence should be estimated and some indication of the special errors to which in common life average minds are most liable. A student who obtains four sessional certificates, three in the humanities course of work and one in the principles of evidence and reasoning, will be qualified to receive the vice-chancellor's certificate.

Having obtained the vice-chancellor's certificate the student will then be eligible to undertake a further session's work by attending an approved course of study of a more special kind

in one or other of two groups to be tested at the end of the session by an examination in the group selected, which will include three papers. The two groups are:—(1) General history as a main subject (two papers), and English literature as a subsidiary subject (one paper); or (2) the British Constitution as a main subject (two papers), and economic history with special reference to England as a subsidiary subject (one paper). The student will then (one other condition referred to below being satisfied) receive the new advanced certificate. The name of this certificate and the privileges it may carry are still under the consideration of the university. The condition above referred to is that the candidate should show evidence of sufficient preliminary training to profit in the course of study. What kind of evidence the university will accept will have to be determined, for the present at least as the cases arise. Particulars are published of the courses of lectures which have been arranged under the scheme.

MANCHESTER SOCIETY OF ARCHITECTS.

ON September 19 the members of this Society visited the recent buildings at Alderley. Mr. McConnell's (Messrs. Thos. Worthington & Son, architects) was the greatest treat of the day, with its picturesque whitewashed stone-slatted exterior and charming interior. A fireplace of green tiles, beaten brasswork and bosses of green enamel attracted much attention. The same architects' house at Agnew, a brick and stone building, contained much of interest. Mr. Alex. Graham's Epileptic Homes at Sandlebridge, now approaching completion, formed a study of a novel type of building, in which the planning and all practical details had evidently been worked out with the greatest care and foresight. The growing darkness prevented more than a hasty glance. Messrs. Worthington & Son's convalescent home, however, showed that when completed it will make an excellent grade of simple character.

TESSERÆ.

Domestic Subjects in Painting.

THOUGH in a general sense all subjects are historical, much as the events of the day form the material for the history for the morrow, yet it may be as well to keep a distinction usually accepted, and to term what treats of the present as local or domestic, and what treats of the past as purely historical. It is generally supposed that such subjects are much easier to attain in the illustration of those subjects which we are every day cognisant, than of events, the knowledge of which literature is our only guide. And doubt there is a great advantage in being able to consult the actual materials necessary for the object we have in view, and also there is a greater likelihood of awakening the interest of the spectator by depicting the real present than the ideal past; but, on the other hand, as regards the former, the truth of the artist's delineation is put to a severe test, for it is easily compared with living nature, whereas in treating of the past the truth of the painter's conception is not subject to such a searching comparison. Moreover, there is a halo about the past which never clings to the present, and in this the artist shows the highest powers if he can excite sympathy by subjects which, unlike the stirring events of history, have hitherto held no place in the mind. And such local and domestic themes the highest quality of painting can be equally developed, and a picture of Ostade, merely representing an old woman cleaning a brass pan, is worth acres of the pretentious medallions we see in Italian art after the middle of the sixteenth century. Certainly no artist ever better deserved the title of an inventor than Hogarth; his pictures are perfect stores of clearness and with no redundancy of ornament, the being a single detail introduced which is not necessary for the elucidation of the subject. It is sometimes questioned whether an additional charm would not have been imparted to the pictures had they possessed those qualities of colour and execution which we admire so much in the Venetian and Dutch painters. The result would probably have been satisfactory. The impression produced by his and other great works arises from the combination of the qualities of truth, possess, and it is impossible to decide with any degree of accuracy on which particular quality the expression of the artist depends. We might as well say that the humour of Sterne would have been more pungent and effective had they been decked in the refined language of Marlowe. Moreover, by drawing attention to the peculiar charm of an abstract quality he would most assuredly have weakened its hold on the mind. Hogarth produced the effect he sought in a far more satisfactory manner than would have been possible through the introduction of qualities which, however fascinating and appropriate in works of a different character, would have imparted no additional strength to his conceptions.

Pompeii.

Withstanding the magnificent ideas we are apt to form of the splendour of Athens and Rome from the remains of public structures, it is most probable that their general appearance was far from being either lively or imposing. Streets with little more than dead walls towards them have produced an effect the very reverse of grandeur. Entrances to the houses and the shops in some of the were the only signs of habitation in these sepulchral or could the shops themselves, windowless as they have made a much better appearance than those of our criers and butchers. At Pompeii the general width of streets is not more than that of the foot pavement in London street, in many not so much. Unless therefore we are to admire such dismal lanes as branch off from the main Street, we are afraid we should not be greatly charmed by the classical mode of laying-out towns. In point of fact it is probable that the streets of Rome did not much, if indeed those of the provincial city, which may account for the series of walking in them so humorously described by the Roman satirist. It is true the houses were not very different therefore the passage between them did not appear so narrow as it otherwise would have done; yet this difference certainly did not contribute to dignity and beauty. The most spacious street at Pompeii was that of the Forum, and the view of it in Sir W. Gell's work will not be a very favourable at least a very honest idea of the general physiognomy of domestic architecture among the ancients. Excepting here and there a small window, or rather an aperture to admit light, there are no features to give the appearance of blankness, and nothing to contribute to variety or to decoration. The absence of windows in the street, altogether so contrary to our notions of domestic life, must have given such a sombre aspect to the street for the most part such an air of dulness to the apartment within, that very few will be inclined to admire this mode of building. We must not, however, impute it to Turkish suspicion and jealousy, or to an affectation of privacy; since had they been so situated, the inmates would have as well have sat in the open street as in an apartment exposed. Not only would the rooms have been open to the view of passengers and neighbours, in a manner more than for the Asmodei and Paul Prys of antiquity than to those who would have been thus placed under constant surveillance, but they would hardly have been on account of the noise and din from the street. Therefore, the Pompeians had been as taciturn as the monks of La Trappe when abroad, and tolerably discreet when at home, they could not have manifested their independence better than by building as they did. We, on the other hand, are fettered by no such inconveniences as the ancients may therefore build as we please.

A City Art Society.

From time to time an attempt is made to gain a footing for the City of London. But somehow or other it is never secured. At the beginning of 1831 it was the City Art Society with the title "City of London Artists and Conversazione" would be an exception, as it was to possess the elements of success. The following were the regulations:—1. The number of members shall be limited to 100. The contingent exception hereafter stated (Law 5). Every member's subscription shall be one guinea per annum, payable in advance, on or before the first Thursday in the month of January in the honorary secretary and treasurer, Mr. Frederick W. Hall Court: on failure, a vacancy shall be filled by the election of members vested in the general body; to take place on the third Thursday of the month of January. 2. None but artists and amateurs are eligible to become members of the Society. 3. As the object of the Society is to promote the love of art, the mutual improvement and advantage of the members in its respective departments, to form a centre of attraction in this division of the art, it is expected that every member will forward to the meeting specimens of his own works, or those of other artists, which he may consider as tending to the furtherance of the object of the Society. 4. When a vacancy is declared, the names of the candidates shall be determined by a majority of "scratches" or by ballot. Should any two candidates be named, an equal number, the decision to be vested in the members who shall determine without seeing the names. A candidate desirous of becoming a candidate, forward his name to the honorary secretary the recommendatory signatures of two members (the same having been publicly exhibited two weeks prior to the day of election), shall be required. Nevertheless, to meet advantageous contingencies, any member at any time wishing to become a member, may forward his signatures of twelve members, six of them being members of the Society, and forwarding his application thus signed to the honorary secretary, shall be eligible to be elected at the

next meeting (his application having been publicly exhibited during that evening), though such election should occasion an excess in the number of members, such excess to be reduced by the first vacancy declared. 6. Every member, in addition to his own, to be allowed two transferable single tickets each for any one evening of meeting; the committee as a body to have the privilege of six on all evenings, in order to the introduction of illustrious or distinguished visitors who may feel an interest in the object of the Institution. 7. The business of the Society shall be conducted by a chairman and honorary secretary, who together with five other members shall constitute a committee. The committee, including the above officers, shall be elected annually, be empowered to make by-laws and to receive through the secretary all communications. 8. The committee shall meet to audit the accounts some time in October previous to the general meeting. 9. The meetings of the Society shall be held on the third Thursday evening of the months of November, December, January, February, March and April, at the London Coffee House, Ludgate Street, at eight o'clock. The Conversazione shared the fate of its predecessors and successors in having only a brief existence.

Glass Windows.

The invention of glass has conferred such numerous advantages upon the moderns, both as regards domestic life and scientific discovery, that could any one have predicted them two thousand years ago! they would have been deemed incredible fables. We say the invention of glass because, although that material was certainly known to the ancients, it was employed chiefly, if not altogether exclusively, for articles of mere luxury, and not for purposes of real utility. Rarely does it happen that we appreciate what its very serviceableness has rendered so common as to make us forget it was once unknown. By means of this material we are enabled to make our walls transparent, open to the day, yet impervious to rain, wind and dust, and in a sufficient degree also to sound. By means of this the natives of the cold North are enabled to rear the fruits of the South and the flowers of the tropics; by means of this our apartments may be extended to interminable vistas; by means of this we explore the heavens, we trace the organisation of plants, we discover the beings that populate a drop of water, and scrutinise the texture of our own frames; and it is by means of this that the vision of the aged is renovated, and one of the most distressing of human infirmities overcome. Verily the achievements of an Alexander shrink into utter insignificance compared with those triumphs of art that have given to the modern world such a decided superiority over the ancient one. Printing and engraving, glass and steam, would have had altars raised to them in pagan times, and had tutelary deities assigned to them in mythology, who would have ranked with Ceres and Minerva. In his poem "O Polze Stekla" Lomonosov has sung the praises of glass—a singular subject, it will perhaps be thought, but the Russian bard was as much a votary of science as of the muse.

Music and Architecture.

According to Lord Lindsay, music and architecture agree together, and differ from poetry, painting and sculpture in that they are both of them expressive of emotion, not of definite ideas. The most important change that has taken place in the music of the Church was the substitution of music in harmony for music in unison. This is analogous to the most important change in Christian architecture, that from Romanesque to Pointed. The coexistence of several planes of decoration one behind another, a feature which was unknown in Grecian architecture, and received its full development only in Pointed, may evidently be compared to the effect of several simultaneous melodies so adjusted one to another as to form harmony. Secondly, though the terms high and low are used in very different senses in music and in architecture, it will not be disputed that a strong analogy exists between these senses. This being admitted, it will appear that a difference similar to that which consists in the predominance of horizontal lines in Grecian architecture and of vertical lines in Pointed exists between music in unison and music in harmony. Though a single melody consists of notes differing one from another in pitch, yet this difference is necessarily limited by the compass of the voice or instrument, whereas the prolongation of the melody is comparatively unlimited; therefore, like a Grecian building, it presents the idea of horizontal extent much more strongly than that of vertical. On the other hand, when a chord is sounded, both high and low notes are heard at once; the concord which subsists between them leads the mind to compare them, and to pass in thought from one to another, as along a vertical line, and where the organ or other instruments are employed there need be no limit to the height and depth of the notes heard at once, except that of the sounds which the ear can appreciate as musical. A succession of such chords, therefore, resembles a building in which vertical lines predominate over horizontal. Again, the Pointed arch itself has its counterpart in harmonious music. For the fundamental

distinction between circular and elliptic arches, on the one hand, and the various forms of Pointed arches on the other, is that the former exhibit only one curve, first rising, and then falling, whereas Pointed arches are formed by the meeting of two curves. An arcade of circular arches resembles, therefore, a single melody consisting of alternate rises and falls. On the other hand, a Pointed arcade, containing as it must a double series of curves, will be represented musically by a canon composed of two such melodies, one of which rises while the other falls.

Lighting of Greek Temples.

On the means adopted for giving light to the temples of the ancients there is a discussion in the introduction to the second edition of the first volume of "Ionian Antiquities," published by the Society of Dilettanti. It is a reply to the position assumed by Quatremère de Quincy, and published by him in the "Memoirs of the French Institute"—that skylights were used for this purpose. The perpetual lamp made by Callimachus for the temple of Minerva-Polias may certainly be said to throw some light on this subject; and in referring to the earliest authentic record of temple-building we find that in the Temple of Jerusalem there were ten candelabra, each supporting lamps which burned without intermission; a plan adopted for the display and inspection of the precious vessels arranged on tables placed along the side-walls of the cella. In like manner the donaria within the cella of the Parthenon were distributed, although they were protected probably by a kind of open palisade between piers or stelæ, so constructed for its greater stability. In the restoration of the ancient inscriptions found within the Parthenon and brought to England by Dr. Chandler for the Dilettanti Society, Mr. Rose has discovered frequent mention of gold or gilded lamps. We already knew that golden ewers and basins, such as are described in the Sacred Writings to have been deposited within the Jewish temple, formed the chief of the anathemata contained in the Parthenon. There is no authority whatever for the supposition that temples, excepting those of a peculiar description and of rare occurrence, admitted light from without. Rome, abounding in shrines and temples and edifices of the most princely kind, afforded no example of such a building; and Vitruvius, in order to illustrate his definitions, refers his readers to the Temple of Jupiter Olympius, situated in the acropolis or lower city of Athens.

The Parthenon.

Commenced about the eighty-third Olympiad, or about 448 B.C., the rapidity of the execution of the Parthenon is recorded by the historian, and by the comparison of historic dates and events, sixteen years is the utmost extent of time that can be possibly supposed to have been occupied in the performance of the entire works. This comprised the building 101 feet in front, 227 feet in length and 65 feet in height, wrought in the most durable marble and with the exquisite finish of a cameo, enshrining the chryselephantine colossus with all its gorgeous adjuncts. The sculptured decoration consisted of a range of 1,100 feet and containing on calculation upwards of 600 figures, a portion of which were colossal, enriched by painting and probably golden ornaments. Hence has really been verified the prediction of Pericles, that when the edifices of rival States would be mouldering in oblivion the splendour of his city would be still paramount and triumphant.

GENERAL.

Professor Flinders Petrie and **Dr. Charles Waldstein** will give a series of lectures at the University of London, South Kensington, on "Recent Excavations in Asia Minor, Babylonia and Greece," in connection with the University Extension courses, beginning October 16. Lectures on Classical architecture and kindred subjects will be given at other centres.

The Prix Chaudesaignes of 2,000 francs has been awarded by the Académie des Beaux-Arts to **M. Lefort**, pupil of **M. Paulin**. The following honourable mentions have been also made:—The first to **M. Lefèvre**, pupil of **M. Laloux**; the second to **M. Prevot**, pupil of **MM. Guadet & Paulin**; the third to **M. Broussois**, pupil of **M. Pascal**.

The Architectural League of America will hold its annual convention at St. Louis, Mo., on Monday and Tuesday, October 6 and 7. The "Code of Ethics and Competitions" and other matters of current interest will be discussed at the meetings.

The New Church of **SS. Gilbert and Hugh** at **Gosberton Clough**, near **Spalding**, was opened on Saturday last. The building, which has been erected at a cost of 1,300*l.*, will accommodate 120 worshippers, and is from designs by **Messrs. W. Bucknell and J. N. Cooper**, of **Westminster**.

St. Pancras Borough Council has referred to its permanent and general purposes committee the question of acquiring **Mornington Crescent Gardens** as a possible site for the new town hall and an additional open space for the borough.

The Cuban Congress have voted 30,000*l.* for the construction of a building for the Chamber of Representatives of Cuba. An international competition will be organised for the purpose of obtaining designs. About 1,000*l.* will be awarded as premiums.

A Special Court of the Corporation of the Poor, Vice-presidents and Governors of King's College Hospital, is to be held in the large theatre at King's College, Strand, on the 12th inst., for the purpose of obtaining sanction for the removal of the hospital from its present site to one in London.

Gresham's School, **Holt, Norfolk**, was opened on Wednesday by **Sir Evelyn Wood**. The architect is **Mr. H. C. Clarke**.

Mr. J. Thorburn Ross, A.R.S.A., died on Monday morning from injuries received through a fall in his bath at **Atholl Crescent Lane**. He was in his forty-fifth year.

Messrs. Waring & Gillow, Ltd., have been entrusted with the fitting and decoration of the **Sultan's State barge**, which was launched at **Newcastle** on Friday.

Mr. Francis W. Bedford announces that his business address in London is now 22 Old Burlington Street, W. His offices in Leeds will continue at Greek Chambers.

The Duke of York's Royal Military School is to be removed from **Chelsea** to **Dover**, and an extensive site has been secured for the new buildings, comprising about 140 acres on the high ground adjoining the **Fort Burgoyne** drill-ground. A very large proportion of the area is to be covered with new storey buildings for the accommodation of the staff and boys. It is anticipated that the present site in **Chelsea** will be sold for 750,000*l.*

A Roof Garden is to be formed at the **Philadelphia Hospital** for patients suffering from tuberculosis. The available measures 26 by 150 feet and will be covered with canvas awning.

The New American Church in **Berlin** will soon be completed. It is expected that services can be held on December 1. The plans were prepared by **Herr Otto** and the works are directed by **Herr Jäger**. The building cost about 400,000 marks.

Mr. Albert Toft has been commissioned to execute a statue to be erected in **Nottingham** as a memorial to **Queen Victoria**. Her late Majesty is to be represented in marble in a standing position wearing her crown, and with sceptre in the right hand and the orb in the left. The statue is to be from 9 feet 6 inches to 10 feet in height on a pedestal of polished red granite 15 feet in height. **Mr. Toft** expects to complete the work by November of next year.

M. Edouard Detaille has been commissioned to execute a painting symbolising "Le Chant du Départ" of the Revolutionary Troops, which is to complete the decoration of the **Pantéon**.

The House in **Commercial Road, Landport**, in which **Charles Dickens** was born, has been purchased by the Corporation of **Portsmouth** for 1,125*l.*, or about three times its value.

The Board of Trade has informed the **Marlow Borough Council** that the Board is legally advised that it would not be justified in granting a license to the Board to supply electricity within the borough.

The Archæological Society of Peterborough are endeavouring to raise funds to place a railing around the remains of **Fotheringhay Castle**, for otherwise the whole of the stones would, in a limited time, be carried away by visitors.

The Liverpool Cathedral Committee decided on Monday after consideration of various samples of stone submitted that local red sandstone should be used in building the cathedral. The architects, **Mr. Bodley** and **Mr. G. G. Scott**, also submitted plans of details. It is expected the foundation will be laid early in the coming year.

The Lord Mayor on Wednesday unveiled **Mr. J. Tayler's** picture, *The Entertainment in 1356 by the Viscount's Company of the Five Kings*. The picture is the gift of **W. Vivian**, and is placed in the ambulatory of the **Exchange**.

The Brazilian Government has signed a contract with **Messrs. C. H. Walker & Co.**, of **Westminster**, for the construction of the **Rio de Janeiro** port and dock works.

The New Church being erected at **New Malden** will have seating accommodation for about 250 people. The first stones were laid by **Mr. Thurslow Astley** on Friday last.

EDITORIAL NOTICES.

few of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BRIGHTON.—Nov. 9.—Designs are invited for a new hospital. Premiums of 50*l*, 30*l*, and 20*l* will be paid to the first, second and third premiated designs respectively. Particulars up to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Brighton and Hove Hospital for Women, 76 West Street, Brighton.

ELHAM.—Oct. 7.—For sewage disposal of the village of Elham. Report, plan and estimate of probable cost. Premium 30 guineas. Further particulars, Mr. R. Loneragan, Heriton Place, Folkestone.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for a free library, town hall and assembly-room buildings. Premiums of 100*l*, 50*l*, and 30*l* respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—The Glasgow Corporation are prepared to receive from architects competitive sketch plans, with estimate of cost, for the erection of a branch library for the Parkhead District. A plan of the site and a copy of the conditions of competition may be obtained on application to Mr. J. D. Warwick, town clerk, City Chambers, Glasgow.

SHEPTON MALLET.—Oct. 15.—For the erection of a hall to be used as drill hall and for musical purposes, cost not to exceed £1,200. Plan of site and copy of conditions on payment of £1 1*s*., which will be returned, from Mr. H. Charles Budd, 12 Commercial Road, Shepton Mallet.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100*l*, 50*l*, and 25*l* will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20*l*, 10*l*, and 5*l* will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WALKLEY.—Sheffield City Council invite from architects practising in the city competitive designs for the erection of a new free library. Premiums of 40*l* and 10*l* are offered. Mr. C. F. Wike, city surveyor, Town Hall.

CONTRACTS OPEN.

ALNWICK.—Oct. 6.—For the erection of a new billiard-room at the Alnwick Mechanics' Institute. The Secretaries, Mechanics' Institute, Alnwick.

BARROW-IN-FURNESS.—Oct. 10.—For alterations to the old municipal buildings. Particulars may be obtained at the Borough Engineer's Office.

BIRMINGHAM.—Oct. 5.—For the erection of a police-station in Bloomsbury Street. Mr. John Price, city surveyor, Council House, Birmingham.

BLACKHEATH.—Oct. 15.—For the erection of dépôt buildings on site at St. John's Park. Mr. Francis Robinson, town clerk, Town Hall, Greenwich Road, S.E.

BRADFORD.—Oct. 5.—For roofing stand at Valley Parade, for the Bradford City Football Club. Mr. R. Campbell, secretary, Belle Vue Hotel, Bradford.

BRIGHTON.—Oct. 5.—For internal repairs and alterations, &c., to the offices of the education committee, 54 Old Steine, Brighton. Messrs. T. Simpson & Son, surveyors, 17 Ship Street, Brighton.

CAIRO.—Feb. 1, 1904.—For the construction of three bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CARLISLE.—Oct. 5.—For additions to the town clerk's office, Fisher Street. Mr. Henry C. Marks, surveyor, 35 Fisher Street, Carlisle.

DARTMOUTH.—Oct. 5.—For the erection of retaining walls, steps, piers and other necessary work connected with the Manor House improvement at South Town, and the pulling-down and removal of the dwelling-house and buildings now on the site, for the Corporation. Mr. Arthur Smith, borough surveyor, Dartmouth.

DARTMOUTH.—Oct. 6.—For the erection of the Royal Oak inn, Dartmouth. Mr. E. H. Back, architect, Dartmouth.

DEWSBURY.—For the erection of a warehouse in Wood and Bradford Streets, Dewsbury. Messrs Holtom & Fox, architects, Corporation Street, Dewsbury.

NORTH OF ENGLAND SCHOOL FURNISHING CO., LTD.

MANUFACTURERS OF COMPLETE FITTINGS FOR

LIBRARIES, TECHNICAL & ART SCHOOLS,
SCHOOL DESKS, &c., and CHURCH FURNITURE.

Catalogues and Estimates Free on Application.

Sole Makers of WILKS PATENT "CLIMAX" SLIDING PARTITIONS.

Contractors to H.M. Government, London and Birmingham School Boards, &c.

Addresses: DARLINGTON, NEWCASTLE, SUNDERLAND, MIDDLESBRO, and NORWICH.

EMBLETON.—Oct. 17.—For erection of farm buildings at Low Netherscales, Embleton, Cumberland. Mr. Edmund Jackson, civil engineer, Whitehaven.

FULHAM.—Oct. 7.—For the erection of two lodges, with refreshment-rooms, lavatories, &c., attached, situate in the South Park, Fulham. Mr. Francis Wood, engineer, Town Hall, Fulham, S.W.

HALIFAX.—Oct. 5.—For the erection of a pair of semi-detached villas on the Greenroyd Estate, Skircoat. Messrs Richard Horsfall & Sons, architects, 22A Commercial Street, Halifax.

ELECTRIC NOTES.

THE Southgate Urban District Council have unanimously agreed to apply to the Board of Trade for a provisional order authorising the generating, storing, distributing and selling of electrical energy for public and private purposes in the Southgate locality.

A HUGE scheme has been promoted for the supply of electricity and power gas throughout Cheshire. In conjunction with the scheme it is intended to apply for powers to construct an electric tramway connecting Macclesfield on the one end with Hazel Grove and Stockport to Manchester, and to Macclesfield to Congleton, Sandbach, Crewe and Nantwich, with a branch line from Macclesfield through Broken Cross, Henbury, Chelford, Knutsford to Warrington. The scheme will comprise tramways to open out inter-communication between all the towns in Cheshire. Messrs. Rowcliffe & Co., of 100, Market Street, Manchester, who have forwarded details of the scheme to the Macclesfield Town Council and Chamber of Commerce, claim the scheme to be of the highest importance to Cheshire.

TRADE NOTES.

MESSRS. WARING & GILLOW, LTD., have secured a contract for the fittings and decorations of the Sultan's yacht, the *Albatross*.

MESSRS. JOHN OAKLEY & SONS, Limited, have declared a twenty-first half-yearly dividend on the Preference shares at a rate of 6 per cent. per annum less income-tax, payable on Monday, November 2.

ON St Michael's Day, September 29, a new clock was unveiled at the new chimes adapted from one of Dr. Wesley's anthems. Messrs. Wm Potts & Sons, clock manufacturers, Leamington, Newcastle, and first inserted in a public clock at Keighley. The set going by Mr. Joseph Greenwood, of Malsis Road, Keighley, the donor, on his seventy-fifth birthday, an engraving of the clock being fixed at the entrance bearing a suitable inscription.

ILLUSTRATIONS.

MANUEL CHURCH, STOUGHTON, NEAR GUILDFORD.
OF CHAPEL, ROYAL MILITARY HOSPITAL, KILMAINHAM.
BROOM HALL, OXSHOTT.

MRSS. DENT & HELLYER announce that owing to their premises being required by the London County Council for the Holborn-Strand improvements, their business has been removed to 35 Red Lion Square and 75 Theobald's Road, N.C. The new and extensive premises are close to the Kingsway, the important new street now in course of construction, at its juncture with Holborn, and are within seven minutes' walk of their old works in Newcastle Street, where they have been established over a century and a half.

The tender of the Columbian Fireproofing Co., Ltd., 10 William Street, E.C., has been accepted for the steel-reproof floors, gallery and landings required for Childers House, Hants, for which the architects are Messrs Colson, Gifford & Nisbett, 29 New Bridge Street, E.C.; and they are proceeding with the work for the large mansion house of 10 Park, Winchester, for which some short time ago they secured the contract for the constructional steelwork and the construction, the architect of this work being Mr. Marshall Mackenzie, A.R.S.A., 343 Union Street, Aberdeen.

BUILDING AND BUILDERS.

The Town Council of Macclesfield have adopted the scheme of Mr. R. E. W. Berrington, M.I.C.E., of Westminster and Hampton, for the improvement of their sewage disposal works, at a cost of about 14,000*l*.

The foundation-stone of the new municipal offices in Earle Road, Crewe, was laid last week. The new buildings are on Corporation's freehold site near the Market Hall, and the estimated cost, including furnishing, is 18,000*l*.

The foundation-stone of a Roman Catholic church, to be dedicated to St. Hugh, was laid on a site in Earle Road, Liverpool, on a Sunday afternoon, by Bishop Whiteside. The church is to be built at a cost of 6,000*l*., which sum has been given by Mr. William Nelson.

THE Reading Town Council having applied to the Local Government Board for sanction to borrow 20,000*l*. for the erection of an infectious diseases hospital, Mr. W. W. E. Fletcher, an inspector of the Board, held an inquiry into the subject matter of the application at the town hall, Reading, on Thursday morning. No opposition was offered.

THE crisis in the New York building trade has reached an extreme stage, and between fifty million and sixty million dollars intended for investment in New York buildings have been withdrawn owing to the ceaseless strikes. The employers admit that the notorious Sam Parks, the labour agitator recently convicted of extorting money, now controls the situation.

THE question of securing additional office accommodation in connection with the Wallasey (Cheshire) District Council has resulted in a number of schemes being suggested, the North Meade estate, Seacombe, having been prominently mentioned as a suitable site. The works committee now recommend that a committee of the whole Council be summoned to consider and determine upon a new site and the erection of public offices.

THE Duchess of Bedford on Saturday afternoon visited Watford, where she opened a new wing added to the district hospital to celebrate the Coronation of His Majesty King Edward VII. The new portion of the hospital includes two new wards for six beds each, various offices, a dental operating-room and a dark-room for X-rays, the whole being lighted by electricity and heated on the medium-pressure hot-water system. The cost is about 4,300*l*.

CHARLES EASSON, a painter, residing in Dura Street, Dundee, met his death under sad circumstances on Saturday forenoon. Easson was engaged at work on the roof of a building in the western district of the city when his foot slipped and he fell on a glass roof. The force of the fall smashed the glass, and he tumbled into the flat below. He was picked up unconscious and died a few minutes later.

ON Saturday afternoon the Bishop of Salford laid a memorial stone at the Roman Catholic schools and chapel of St. Alphonsus, now in course of erection at Brooks's Bar, Manchester, on land given by Sir H. de Trafford. The increase of the Catholic population in the district has necessitated this further provision, and a new parish is being formed out of the existing one of St. Wilfrid's, Hulme. The accommodation provided is three classrooms on the ground floor and two for infants, with

total space for 300 scholars. Above these is the chapel. The building stands well back from the street, and at the entrance a presbytery is being built. The total cost will be 6,000/.

ON the 23rd ult. the foundation-stone was laid of the new church for Glencraig and Lochore, Dunfermline. The building is being erected from designs by Mr. Robert Brown, architect, of Scotlandwell, at a point almost midway between the villages of Glencraig and Lochore, to accommodate 370 worshippers, and when the necessity arises and funds permit, a gallery will be introduced capable of seating an additional 200 persons. At the rear of the building, the plans provide for the erection of a hall, which will seat 100 people. It is expected that the building will cost between 1,400/ and 1,500/.

THE wall of the moulding shop of Messrs. Fairbairn, Lawson, Combe & Barbour's foundry, Belfast, one of the largest establishments of the kind in the United Kingdom, collapsed on Monday evening, the result being that several men were killed and others seriously injured. At the time the accident occurred eight men and two boys were engaged executing structural alterations at the foundry, and they all were buried in the ruins of a very high wall. It was not known for the moment what was the extent of the disaster, but willing hands at once set to work to extricate the unfortunate sufferers. It was soon apparent, however, that so heavy had been the fall of material that it was hopeless to expect to rescue all the entombed men alive, and a correspondent, telegraphing later, stated that six dead bodies had been recovered, while two men who were brought out alive were so seriously injured that but little hope was entertained of their recovery.

SPECIFICATIONS are being prepared with a view of calling within the next two months for tenders for the construction of the new Swansea dock, which is to cost close on 2,000,000/ and cover an area of over 70 acres, with 11,000 lineal feet of quays. The new dock is intended to accommodate the largest vessels afloat, there being a minimum depth of 12 feet of water on the outer silt at low spring tides, and 19 feet 9 inches of low water at neap tides, as compared with 15 feet at Cardiff and Bristol. Barry dock gives a depth of 21 feet 7 inches, and powers are given under the new Swansea Dock Act to lower the silt if necessary to a greater depth even than that of Barry, a deviation of 7 feet in the levels being provided for. Five important new railways will be laid down to feed the dock, the existing entrance channel is to be improved, and the half-tide

basin of the south dock is to be enlarged. The existing area of Swansea dock is 54½ acres, and that of the new entrance will give the port a total of 125 acres.

AT a meeting of the Board of Management of the Manchester Royal Infirmary on Monday, Mr. John Thomson, chairman, it was announced that it was intended to give notice to the tenants on the Stanley Grove estate, the site of the infirmary. The Chairman said communications had been received from various tenants asking when it would be necessary that they should vacate their premises. It was thought well, therefore, that the Board should pass a general resolution and leave it to their legal advisers to arrange the exact date of the resolution to which he would ask the Board to accede with the authorities of Owens College (the transfer of the estate of the Infirmary Trustees not having yet taken place) be required to give notice to the tenants to quit the premises they respectively hold on the Stanley Grove estate. The resolution was passed.

ON the 5th inst. the free library which has been presented to the burgh of Govan by Mrs. John Elder, was opened by Dr. Carnegie. The library is situated in the south-east corner of Elder Park, and is entered from the corner of Thomson Street and Langlands Road intersect. The principal elevation, which is towards the street, contains an entrance colonnade that forms a centrepiece to the building, and is mounted by a balustrade, in the centre of which is carved the Govan coat of arms, with the burgh motto, "Nihil sine laude." The style of architecture is purely Classic, and the aim of the architect, Mr. John Burnet, A.R.S.A., has been to make the library as far as possible part of the park, from which it is reached off by only a light railing. The building consists of two floors. The basement is utilised as a book store, work-packing-room and furnace-room. On the ground floor are the news-room (53 feet by 23 feet), reference library for ladies and gentlemen, librarian's room and a large common room. The lending library, which is 45 feet by 22 feet 3 inches and capable of accommodating from 30,000 to 40,000 volumes, is also situated on this floor. From the corridor a staircase leads to the upper flat, which is to be used as a museum and junior room, there being separate compartments in the latter for boys and girls. The three elevations overlooking the park are of a simple yet dignified type, with a little carved enrichment at appropriate points. From the roof and over the main entrance there rises a small dome with flagstaff.

VARIETIES.

Unitarian chapel has been erected at Selby on the old chapel, which dated from 1662. The new building formally opened on Thursday.

W. G. R. SPRAGUE, the theatrical architect, has moved to larger and more central offices at Criterion House, Jermyn Street.

A new Roman Catholic convent and educational establishment has been opened at Olton Court, Olton, by a community of nuns who have left France owing to the operation of the law.

Under the notices in the *Gazette* of the dissolution of partnerships we notice the names of Georges M. E. L. Verlyck and T. Dunn, architects, of Adelaide Chambers, Roding Road.

A new church at Gosberton Clough, near Spalding, was opened on Saturday. The building, which has been erected at a cost of 1,300l., will accommodate 120 worshippers. The church has been given the name of SS. Gilbert and Hugh.

The Corporation of Brighton mean to make a big effort to succeed for the Aquarium. After the present Building Exhibition it is their intention to run an Inventions Exhibition, starting in November next.

The issue of the *Sketch* for September 23 will be seen a new Waldorf Theatre, Aldwych, the new thoroughfare from Holborn to the Strand. The architect is Mr. W. G. R. Sprague, who is also architect for the new hotel which will adjoin the theatre.

A fire, which did damage to the extent of over 2,000l., broke out last week at the building works of Messrs Sherratt, Smith & Smallthorne, in Staffordshire. Many stacks of bricks, mortar-mill and the planing machinery were destroyed.

The King has promised to present a new lectern to Portsmouth Cathedral. The lectern will be of gun-metal, and is the only lectern made of that material in any church. The cathedral is an historic building, and is now undergoing extensive renovation.

The School Board of Croydon, which shortly ceases to exist under the new Education Act, sanctioned an application at its last meeting to the Public Works Loan Board for a loan of nearly 20,000l. for the purpose of erecting new schools in the district.

On Friday morning last a fatal accident occurred on the new buildings of the Savoy hotel, Strand. A girder was being hoisted by means of a hand crane when the jib of the crane gave way, causing the men to let go. Unfortunately one man was killed and two others injured.

THE general purposes committee of the St. Pancras Borough Council have under consideration the question of acquiring Mornington Crescent Gardens as a site for the new town hall, which would be so erected as to leave part of the site as public gardens.

THE Billinghay (Lincs) parish council being confronted by a threatened water famine, and having already expended some 200l. of the ratepayers' money in unfruitful boring operations, have decided to engage Mr. Stone, a "water diviner," of Bolingbroke, to locate a site where water can be obtained by boring.

THE Rural District Council of Wolstanton have adopted the scheme of sewage disposal of Mr. R. E. W. Berrington, M.I.C.E., for Basford, Longbridge, Hayes and Harefield, estimated to cost 5,000l., and application is being made to the Local Government Board for a loan to carry out the works.

IN addition to the 30,000l. which is being spent by the Glasgow and South-Western Railway Company on rebuilding the quay walls, raising the crane foundations, and erecting a new 50-ton crane at the pier-head berths at Troon harbour, a sum of 5,000l. is being expended on a hydraulic system of waggon haulage.

THE Oakengates Urban District Council have instructed the engineer, Mr. R. E. W. Berrington, M.I.C.E., to proceed with the carrying-out of the new sewerage scheme, and have accepted the tender of Mr. H. Holloway, Wolverhampton, for Contract No. 1.

AT the Guildhall Alderman and Sheriff Sir John Knill, Bart, was sworn into the office of Master of the Worshipful Company of Plumbers; and Dr. Robert Crawford, LL.D., and Alderman Hind, into the offices of Warden and Renter Warden, respectively, on re-election for the ensuing year.

NINE competitive designs were sent in for the new school at Gorse Hill, Stretford, Lancs. After a protracted discussion it was agreed to adopt the plan awarded by the assessor. The clerk reported that the Board of Education had approved by letters the sites for the Gorse Hill and Trafford Park new schools.

THE CUNDALL PATENT OIL ENGINE

TESTIMONIALS FROM LETTERS RECEIVED.

"I am pleased to show the 20 B.H.P. Oil Engine to any contractor, and can thoroughly recommend it."

"I have great pleasure in testifying to the efficiency of the Oil Engine which you supplied for driving the dynamo. It gives current of equal H.P. for Lighting and Heating. The Engine has now been in use almost three months, without the slightest hitch. It gives satisfaction and the most favourable results."

"I am glad to know that the 8-Brake Oil Engine which I ordered some time ago is giving me entire satisfaction. It runs very steadily—so much so that I am able to supply power direct, without the slightest waver in the pressure, and easily started. I should say your Engines are the best I have seen as possible."

London Office—20 & 22 St. Bride Street, E.C.

Paris Office—5 Rue Gozlin.

A MASONIC hall, which has been erected at Moville, Donegal, was opened on Thursday evening. It occupies a conspicuous site overlooking the green, and it is intended that the lower portion of the building will be used for general purposes, a spacious apartment being provided there which will be suitable for lectures and meetings.

MR. CARTER, until last week the deputy engineer for Croydon, who has for some considerable time past most efficiently carried out the duties of engineer and surveyor, was duly appointed last week chief engineer and surveyor, at a salary of 800*l.*, rising yearly to 1,200*l.*; this is an increase of 300*l.* per annum to Mr. Carter. Some of our architect friends might cast covetous eyes on some of these municipal appointments.

THE Isle of Man Tynwald Court assembled last week, Lord Raglan presiding. A sum of 12,000*l.* was voted for completing the purchase of the governor's residence, and 2,433*l.* was voted for carrying out additional improvements. It is proposed to erect a new entrance hall and more adequate reception-rooms, and carry out various minor improvements, including the removal of the farmyard, which was in objectionable proximity; 750*l.* was further voted to obtain the surrender of the lease of the farm.

ON Saturday afternoon the new hall of the Airdrie Evangelistic Association, erected as a memorial of the late Dr. and Mrs. Wilson and child, who were martyred in China during the persecution of the missionaries, was formally opened by Mrs. William Service, Coatbridge, while a memorial-stone was laid in the vestibule by Mr. John Wilson, M.P., of Airdrie, Mrs. Service and Mr. Wilson being sister and brother of the late Dr. Wilson. The hall, which is seated for 700 people, has a suite of rooms, including a lesser hall adjoining. The building has been raised by public subscription, the cost being 2,800*l.*, of which about 1,000*l.* has yet to be subscribed.

THE exhibition of the remaining works of the late Phil May at the Leicester Galleries, Leicester Square, will open to the public on Monday, October 5, and will continue until the end of the month. The private view is fixed for the previous Saturday. Messrs. Ernest Brown & Phillips have arranged an interesting feature in connection with this exhibition, as they will show in an adjoining room a large and representative collection of water-colour drawings by Thomas Rowlandson, the famous caricaturist. Several of his most famous drawings, notably "Angelo's Fencing Room" and "Dressing for the

Masquerade," will be on view. Visitors will be afforded an exceptional opportunity of comparing the works of the great humourists of the eighteenth and nineteenth centuries.

EXTENSIVE changes have recently been made in connection with the Solihull Grammar School, the object being to place this educational centre on a basis of thoroughness to make it one of the most successful seats of learning in the Midlands. The old chemical laboratory at the school was provision was regarded as one of the most up-to-date in the country in connection with a grammar school. Behind the times, and a modern laboratory has been erected in addition to science and art rooms, rooms for the physics, lecture-hall, reading-rooms, workshop, dormitories have been increased so as to provide accommodation for an additional number of boarders. The new buildings, together with furnishing, &c., is estimated between 4,000*l.* and 5,000*l.*

MAJOR J. STEWART, R.E., Local Government inspector, held an inquiry in the Burslem council into the application made by the Town Council to borrow for the purpose of public sanitary conveniences to be erected under the Butchers' Market. In reply to the inspector, the town clerk stated that the rateable value of the borough present time was 145,751*l.*, the amount of the council loans 56,660*l.* and the population 40,000. The Major went on to explain that the suggested improvements become necessary owing to the inadequate and antiquated character of the present accommodation. The borough surveyor submitted plans and a description of the proposed improvements, upon the thoroughness of which the inspector was fully satisfied. A vote of thanks was accorded to the Major on the proposition of the Mayor, seconded by Alderman.

THE recently completed extension of St. Mary's Catholic College, Blairs, N.B., was opened on Friday. The new block occupies three sides of a quadrangle, connected at the south-west by the old buildings. The extension has been carried out at a cost of 33,000*l.* from plans by R. G. Wilson, architect, Aberdeen. A striking architectural feature of the new building is a high square tower at the front surmounted by four turrets, each bearing finials in the shape of arrows, while on the top of the central crown dome is a representation of a golden mitre. The internal appointments have been arranged with admirable taste. The class-rooms and students' quarters are spacious and comfortable.

apartments and in the corridors the woodwork has been decorated with rich artistic effect.

Week the new warehouse erected at New Cross, London, was opened by Mr. J. W. Sankey (chairman of the Board of Guardians) in the presence of a large gathering. The site occupies about 50 acres of land. The contract for the building was mounted to 156,870*l*, and this is exclusive of the cost of the site, road-making and boundary walls, nor does it include professional fees, which are stated to amount to about 10 per cent. The total cost of the gigantic undertaking will be about 200,000*l*. The area occupied by the buildings is 100 acres, and provision is made for 1,246 inmates, and sixty other officers—a total of 1,326. The building presents the appearance of a village, and is fitted up with an almost lavish style, with maple wood paneling, mosaic tiled corridors, Doulton fireplaces and other appliances in every room. In the grounds is contained an immense rain-water reservoir.

Sanitary works, on the septic tank system, which have been carried out in connection with the new sewerage system in Linlithgow, have now been set in operation. The works are situated about a mile and a half from the town, on an area of about four acres. The process of filtration is carried on by means of contact beds, and the Stoddart patent distributor. A portion of the filter is composed of porous sand and gravel through which the effluent passes from the contact beds and empties itself into a running stream which has its outfall in the river. The septic tank is in two divisions, so that even when one may be undergoing cleaning or repair the other can be in operation. The process is the first of the kind introduced in Scotland, and the patent distributor is also used for the purpose in connection with such works in this country. The system has given every satisfaction. The engineers are Messrs. Warren & Stuart, C.E., Glasgow, and the contractors, Blair & White, of the same city.

The next quarterly meeting of the Royal Society of Antiquaries of Ireland has been fixed for October 6 at 8 o'clock P.M. in the lecture rooms, 6 St. Stephen's Green, when a paper on the convent in the county Limerick will be submitted to the eminent members, and will be illustrated with lantern slides. The usual social gathering for those belonging to the society and their friends will be held at 7.30, tea being ready at 8, and Mr. Garstin, the president, will on the same

evening exhibit "two Irish political medals and two eighteenth-century views of St. Stephen's Green." The Society's dinner club will meet also at the Shelbourne hotel at 6 o'clock, and the usual business and election of new members will form part of the work of the evening. On the same day, however, an excursion has been arranged which should prove most enjoyable to all who are able to join in it, and as it is confined to places within easy distance no expense is entailed on any members residing in Dublin or the vicinity. St. Patrick's Cathedral will be inspected by permission of and under the guidance of the Dean, Dr. Bernard, while Sir Thomas Drew will discourse on the recent alterations made in the sacred edifice, and the cross lately discovered there. The famous library of Narcissus Marsh, adjacent, will next be visited, and its curiosities shown by permission of the librarian, when doubtless many citizens will for the first time realise what an uncommon "King's treasury" they own in this old library, founded in the seventeenth century by the learned Archbishop, and which is always called by his name, although its right title is "The Public Library, St. Patrick's." Next the members will make the short journey to Kilmainham, and will be received at the Royal Hospital by Major Fielding, and here this interesting home for old soldiers, with its beautiful rooms and chapel, will be inspected, and all the objects of importance drawn attention to. Altogether a very pleasant programme has been put together for the benefit of the members, and although the places to be visited may sound familiar, the knowledge of them will be rendered more complete when accomplished under such favourable circumstances as above indicated. Another evening meeting will take place on November 24.

THE BUILDING TRADES.

BUILDING operations are, despite the supposed stagnation in the building trades, proceeding throughout the country, although possibly the larger jobs are noticeable by their smallness of numbers. Croydon Council passed plans at their last meeting for some 250 houses. The fact is that a spirit of nervousness and unrest is in the land, and it has become fashionable for our manufacturers to grumble at the state of trade. Evidences are, however, to hand that, although matters are far from brilliant as regards the building trades industries, yet, generally speaking, trade is not so bad as might be understood by the grumbling which is so frequently heard.

MODERN ELECTRIC LIFTS.

THE problem of deciding whether the electric or the hydraulic lift is best is one which frequently confronts architects in planning new buildings, with the result that owing to the absence of data concerning electric lifts, and probably some

FIG. 1.—MOTOR AND GEARING FOR PASSENGER LIFT.

suspicion as to their reliability, the choice most often goes in favour of the hydraulic lift. This decision has also no doubt been influenced by the somewhat greater first cost of electric lifts, without taking into account the fact that the cost of running the latter is much less than in the case of even high-pressure hydraulic lifts. It seems to be a strong argument in

favour of the electric lift that nearly all makers of lifts have turned their attention to electric lifts, advocating them against their former specialties. It is impossible for the advocates of the hydraulic lift to deny the fact that in most, if not all, forms of hydraulic lift the power expended per stroke is the same whether the lift is fully loaded or almost empty, whilst with the electric lift the energy taken is nearly proportional to the actual work done.

Amongst electrical engineering firms who have paid special attention to liftwork, Messrs. Penrose & Co., of Farringdon Road, E.C., have been exceptionally successful in avoiding the troubles and breakdowns which are so often regarded as incidental to electric lift installations. Immunity is no doubt due to the careful design of the mechanism and gearing, which possesses points of novelty compared with some other types as to render the same worthy of notice. In the designs we illustrate, the leading idea is to insure not only absolute safety of the lift and its operation but also thorough reliability in working, coupled with the utmost possible economy in the consumption of current.

It will be seen that an important feature is that the controller and winding gear are all on one bed-plate, lined up, fitted and rigidly bolted down. This arrangement is not only good from the point of view of eliminating absorbing friction, but it brings all the mechanism into one place, where it can be carefully inspected and well looked after. It is moreover exceedingly compact and can easily be fitted with in planning the position it should occupy, as it takes up little floor space.

The whole of the working parts are enclosed, but the illustration the cover of the controller-box is removed to show the contents visible in the view.

The provision of a suitable motor is one of the most conducive to the economical and efficient working of a lift. Here Messrs. Penrose & Co. have wisely adopted a special motor which is at the same time fitted with some heavy starting gear which increase the torque at starting, and so enable the lift to be got rapidly under way.

The shaft of this motor carries on its outer end a large wheel shown, and between this brake wheel and the motor is a worm gearing with worm wheel keyed on to the motor shaft as the lifting-rope drum shown on the extreme right. The normal position of the brake is "on," the necessary pressure being secured by the weighted lever shown. The mechanism is controlled by a rope passing round the rope-wheel shown.

THE "CIL-REST" CASEMENT

Is the ONLY REVERSIBLE Casement in the Market which enables the Outside of the Casement and adjoining sashes to be cleaned from the Inside with Perfect Safety.

he shaft on which this wheel is mounted carries a cam, when the wheel is rotated to start the lift raises the brake through the chain and lever shown, thus leaving the free to revolve. The motion of this rope-wheel shaft in each direction by a stop. At its inner end this is carried by bevel wheels with a switch shaft on which are two switches. One of them is the reversing switch the other is the actual circuit closer. The arrangement is that the reverse switch is closed in the desired direction the other switch completes the circuit, hence the action of the reverse switch do not suffer from sparking, they are never opened or closed when current is passing. In switch, however, at which the circuit is broken is provided with a magnetic blow-out which effectually prevents. Above the switch shaft will be seen an arm pivoted to the switch casing, and carrying at its other end a piece which can pass over the starting-resistance when in the position shown in the illustration the current is held up by a small roller connected with the rope wheel. As the latter is turned round the roller comes under the arm, leaving it free to fall by its own weight. A dashpot, however, causes the rate of fall to be so slow, no matter how abruptly the starting switch is flung, the rate at which the starting resistances are cut out is controlled, thus making it practically impossible to burn out the fuse or blow the fuse by too heavy a starting

flux of the whole difficulty of applying motors to lift is the provision of a really efficient electric controller, one which can be operated with the hand-rope from the cage, and Messrs. Penrose & Co. have met the requirement fully and satisfactorily in the above-described arrangement, which works with the greatest possible smoothness and precision.

Goods lifts the firm make a motor and gearing which has some particulars from that already described, the design is chiefly tending towards greater simplicity, durability and ability of withstanding rough usage, and the brake is held "on" by a spring instead of a weighted lever. An electro-magnet, through which the armature current is arranged to counteract the force of this spring. Starting "up" with a heavy load the current is large, consequently the electro-magnet is able to take off the pressure of the brake pressure. In starting "down" with a heavy load on the other hand, the current required is small, and the

brake accordingly remains partially on, thus preventing the load getting out of control. The throwing out of the starting resistance is automatically controlled by a dashpot on the same principle as that already described, but the details are worked out in a different manner.

FIG. 2.—MOTOR AND GEARING FOR GOODS LIFT.

Another pattern which Messrs. Penrose & Co. adopt is provided with a winding drum for chain, and is adapted to warehouse cranes, forming equally as satisfactory an arrangement as those previously described.

A word must be said as to the safety gear on the cage itself, this being of an entirely new design, but thoroughly tested for reliability under all conditions.

Messrs. Penrose & Co. claim to have made their equipment

so efficient that, given the necessary data such as length of travel, speed, load, probable number of journeys per day, &c., they are prepared to guarantee the cost of running. For instance, a passenger-lift carrying, say, three or four passengers, making fifty journeys per day at a speed of 150 feet per minute and a travel of 60 feet, with current at $2\frac{1}{2}d.$ per unit, they will guarantee the cost not to exceed $5l.$ per year, or an average of fourteen journeys for one penny.

NEW CATALOGUES.

WE have received from Messrs. S. Clark & Co., of Compton Works, Canonbury Road, N., a copy of their new and attractively got up price list of "Syphon" stoves. The heating and hygienic qualities of these stoves are so well known as to require no special description. We may, however, remind our readers that, owing to the system on which Clark's patent "Syphon" hygienic stoves are constructed, the heat produced is pure, equable and agreeable, and no fumes or smell are given off. The stoves consequently require no flue-pipe, and the whole heat generated is retained in the apartment. The utmost economy in consumption of fuel is thus secured, and an ordinary room can be efficiently heated for an expenditure of 8 cubic feet of gas per hour, which at $3s.$ per 1,000 would cost $1d.$ for $3\frac{1}{2}$ hours' burning. These stoves are manufactured in a variety of styles and sizes, and range in price from $38s.$ to elaborate and highly-decorative specimens up to 10 guineas or more.

MESSRS. W. F. STANLEY & CO., of Great Turnstile, have issued a new catalogue (G) with fully illustrated and priced descriptions of the numerous optical, surveying and drawing instruments, for the manufacture of which the firm has a world-wide reputation. This business, which, by the way, has now reached its jubilee, working under the same management of Mr. W. F. Stanley, has made advance in many branches. Drawing instruments have been improved in detail, the working parts being now made by exact machines. Machinery for dividing surveying instruments and scales has been increased by two very perfect engines, driven by power. By increase of premises at Norwood (1897), greater time is now allowed for the seasoning of all woods and ivory used, which is only possible with a very large stock of material cut to size, such as is kept by no other firm. The finished stock, as now extended, embraces every article for use in office or field, as far as known, for the architect, engineer and draughtsman. Over 2,500 of such articles are given in this catalogue.

THE MOMENTUM ENGINE.

THE Momentum engine can be seen running every night at the Alexandra Palace. Among the many strange features appertain to this engine, it is particularly interesting that the same has been proved to more than double its capacity in power in consequence of a change and alteration in the automatic device, so that from seventy-five lights in the house—all the engine was expected to do—it made a total of 150 lights in the central hall of the Alexandra Palace. The engine is regarded as a wonder in engineering.

Another point is that the electric light made by the engine is perfectly steady, and yet notwithstanding the steadiness of the light, it is really brought about by the working driven shaft, that owes its revolution to the successive action of a series of fly-wheels, so that fly-wheel after fly-wheel is connected to the working shaft, and it would be supposed that such a series would make an irregular output of electricity; but it does not do so, for although one wheel one after the other takes a turn of three, five or seven revolutions connecting the shaft, and nine, twelve or twenty-one disconnecting the light is perfectly steady.

Another of the strange points in the engine is that the motive power of the little driving engines is connected to the working driven shaft. Like Radium, this possesses, we are told, the creative law of power, simply due to this fact, that a free racing fly-wheel in motion (revolution) at 20 lbs. to the ton, but when connected to the working driven shaft it throws out that full force in proportion of that ton by the square of its velocity, so that the machine's powers are doubled by merely doubling the speed of the fly-wheels. In connection with turbine engine machine is destined, according to the inventor's plan, to revolutionise motive power both in power-houses and in connection with steam marine. The experiment is in progress and about to be tried.

ELECTRICITY AT ASTON.

THE electric-power and lighting station, which has been erected and equipped by the Aston Manor Urban Sanitary Council, was formally opened on Tuesday. Mr. Frederick Smith had invited a number of ladies and gentlemen interested in the district to inspect the station.

STREBEL'S ORIGINAL COUNTER-CURRENT SECTIONAL BOILERS

FOR HOT WATER AND LOW PRESSURE STEAM HEATING.

UNEQUALLED IN POWER, EFFICIENCY, OR WORKING ECONOMY.
SIMPLE, RELIABLE, AND DURABLE. 62 SIZES IN STOCK.

The Best & Cheapest Flooring yet Introduced.

D. WITT & COMPANY, 168 TO 176 DRUMMOND STREET.
Telephone No 773 King's Cross. Telegraphic Address, "Vence."

Mrs. Smith switch on the current, while the residents were given a share in the demonstration by reason of the fact that several important places in the district, such as the open space at Aston Cross, were illuminated by means of arc lights and by devices. This novel spectacle, so far as manner is concerned, attracted crowds of spectators. The power and light station is in Chester Street, adjoining the brigade station. It follows almost as a matter of course that the station is entirely modern in design and equipment; in fact, to an expression already used, "You have simply to turn on a switch and a host of things is set going." The engine-house is a large lofty room, 45 feet wide and at present 80 feet high, with a view to extensions the end is a temporary iron structure on wheels. Within this hall are three compound engines coupled to the dynamos. Two of the engines are of 1,000 horse-power each, while the third is of 400 horse-power, making a total of 2,400 horse-power. Notwithstanding the fact that they run at the rate of 290 revolutions per minute, the engines possess that most striking characteristic of modern high-speed engines—almost entire absence of vibration. The dynamos, which are also of modern type, are calculated to produce 1,250 kilowatts. This provision, however, is but the minimum of the undertaking. The power-house is so arranged that the demand for energy and light grows extensions may be made with a minimum of inconvenience. The engine-power, for instance, can be increased to 20,000 horse-power. The switch-gear is also a most impressive contrivance, but far too technical to be described. Quite as interesting as the power-house is the boiler-house. It contains three pairs of tubular boilers, with automatic feeders attached, and a conveyer which brings coals back from the canal side some distance away, deposits them in bins above the boilers, from which it is ultimately fed to the boiler feeders. The conveyer buckets then descend at the side of the building, and passing along beneath the boilers, just in front of the fire-holes, automatically carry off the refuse. The Council have also sunk an artesian well 100 feet deep, for the provision of their own water-supply. The water is raised by electrically driven pumps to a tank of 20,000 gallons capacity, which is on the roof of the building. From the tank the water passes through a filter, is then heated in an economiser in which waste gases from the furnaces are used, and finally is fed into the boilers by electric pumps. From this very general description it will be seen that Aston has secured a thoroughly up-to-date power

LEEDS AND LIVERPOOL CANAL.

AT the last meeting of the Leeds and Liverpool Canal the Chairman said the memorandum recently issued in connection with the half-yearly statement of accounts showed some of the difficulties they had to contend against, one of which was great increase in local rates. He dated the decline of the Canal Company revenue from the leasing of the canal by railway companies, who neglected the waterway which, when handed back, had suffered greatly and had never since recovered. The canal also required great improvements which were costly, and they had to face an increasingly keen competition. Without large expenditure in improvements, the canal would have ceased to exist as a carrying company. The outlook for the coming year was more encouraging and the financial position of the company much improved. Replying to questions, the Chairman said some land in Liverpool would probably be sold in the coming half-year, and would provide funds for further improvements. Subsidiences cost nearly 6,000,000 a year, which was cheaper than buying the coal beneath, and this would continue indefinitely. They would not issue any more shares nor borrow further for the present.

NEW CENTRAL HALL, BIRMINGHAM.

A BUILDING of considerable architectural importance, which has been erected in Birmingham by the Wesleyans for the accommodation of their Central Mission, was opened on the 16th inst.

It is situated in the upper part of Corporation Street, in close proximity to the Law Courts and General Hospital, with the architecture of which it harmonises in a very satisfactory manner.

The elevation is mainly in red terra-cotta, and is designed in free Renaissance style, which is well adapted for a composite building, and is the prevailing fashion in Birmingham. The frontage to Corporation Street is 224 feet, to Ryder Street 113 feet and to Dalton Street 275 feet. The tower is 180 feet high, and is utilised for ventilating purposes. The main frontage is distinctive and imposing. The entrance under the campanile is adorned with bas-reliefs in buff terra-cotta representing incidents in the life of John Wesley. From the spacious entrance hall two grand granolithic staircases lead to the first floor, the greater part of which is occupied by the great hall. This splendid chamber has no less than twenty

JENNINGS' PATENT "P-UP" AND LIFT-OUT LAVATORIES

FOR

Hospitals, Infirmaries, Schools, Hotels, Clubs, Railway Stations, Offices, and every description of Building, Public and Private.

HIGHEST AWARDS AT EVERY EXHIBITION.

The simplicity, freedom from complication, and efficiency has caused this system to be universally adopted, while its cleanliness and saving of time, effected by the instantaneous discharge, is greatly appreciated. The deposit left round the plug hole basins is not only objectionable, but is considered by medical men to be too often the means of communicating disease.

This system has been adopted in Buckingham Palace, Windsor Castle, Marlborough House, and in the Residences of Royalty, the Nobility and Gentry, the principal Clubs, Hotels, Schools, &c, throughout the world, and as a guarantee of efficiency bears the name and address of the Patentee.

GEORGE JENNINGS, LIMITED,
BY SPECIAL APPOINTMENT SANITARY ENGINEERS TO H.M. THE KING,
11, BETH PALACE ROAD, LONDON.

Telegrams, "JENNINGS, LONDON."

PARTICULARS ON APPLICATION.

doorways, so that it could be instantly evacuated in case of fire. It is surrounded by roomy and well-lighted corridors, and is constructed in the form of an amphitheatre. There are tip-up chairs to accommodate over 2,000 people. The dimensions are:—Extreme length, 146 feet; width, 80 feet; height, 48 feet. The hall is beautifully lighted and decorated, and the oxidised silver electroliers, supplied by Mr. Henry Bisseker, are of most artistic design. The platform affords plenty of scope for a peripatetic orator, and behind it is the fine Walker organ, which has been removed from the old building and enlarged. Probably the Gothic case will give place to one more in harmony with the Renaissance building when funds permit. Mr. Wiseman, who is an enthusiastic musician, is also hoping to secure an organ for the Synod Hall, which is also on the first floor. It is a lofty, cheerful room, about 40 feet long and 45 feet wide, suitably furnished to seat about 450 people. On the same floor are the church parlour, in which the ladies will meet; the library, in which the teachers will study; the offices, in which the staff will work; and the large schoolroom, where 400 children will assemble. The second storey contains a roomy gymnasium with a semicircular roof, and rooms set apart for clubs and committees too numerous to mention. The ground floor and basement are to be let for shops and warehouses, with a view to raising the amount of the ground rent, which is about 1,500%. The cost of the building is about 65,000%. Mr. Ewen Harper is the architect, and the work was carried out by Messrs. John Bowen & Sons.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED.

THE third annual report of this company was submitted at the ordinary general meeting held at Winchester House, Old Broad Street, London, E.C., on Wednesday, September 23.

Mr. F. A. White, chairman, presided, and moved the adoption of the report and audited accounts. The report stated that an interim dividend on the preference shares was paid March 31 last, amounting to 59,442*l.* 7*s.*, being at the rate of 5½ per cent. It was now proposed to pay a final dividend of a like amount (59,442*l.* 7*s.*), which would equal a total dividend of 11 per cent. The profit of the company's third year shows an increase over those of the last financial year of 33,586*l.* 15*s.* 5*d.* This increase would have been very much larger had it not been for the continued fall in the selling

price of Portland cement. Had there been no such fall, it would have been a further addition of over 100,000*l.* to the company's net revenue. The reason for this fall is to be looked for, as before, chiefly in the importation of cheap foreign cement, a problem which has received the directors' constant attention, and to the solving of which they will continue to devote efforts. The economies in manufacture have been considerable, and are not only due to cheaper fuel, but are also the result of a substantial extent of expenditure incurred in the object of diminishing cost. During the year 117,879*l.* has been spent on extensions and improvements at the works. The directors are confident that these outlay have been wisely made, and that they should result in still further savings in the cost of manufacture.

It is well known that cement plant cannot be maintained except by large annual expenditure, and the sum of 137,574*l.* 19*s.* charged against revenue for the year represents what is necessary to keep the works in a high state of efficiency. In addition to this charge against revenue, it is recommended that a further sum of 210,000*l.* be carried to the general reserve and depreciation account, which will then amount to 45,000*l.* If this recommendation is adopted, the total charge on revenue for the year for depreciation (exclusive of bad debts reserve) will have been, including the amount written off in the previous year, 48,642*l.* 0*s.* 10*d.* Upwards of 220,000 tons of cement have been produced by the new rotary kiln plant at Arlesey since its erection. This cement continues to be of the highest quality. It conforms to the most stringent specifications, and gives complete satisfaction to customers. An installation has just been completed at the Arlesey works, and the erection of another plant is in progress on the same site. In addition to the 50,000*l.* paid off one of the mortgages the previous year, a further reduction has been made of 16,800*l.* partly by sales of surplus property and partly out of revenue. The actions against the company which failed to convey their businesses to this company under their respective contracts are proceeding. It was mentioned at the meeting last year that the action as to the price of Portland cement used at one of the company's works had resulted in the company's favour in the Court of Appeal after a judgment in the Court below. The directors are glad that the case having been carried to the House of Lords, the tribunal has affirmed the favourable judgment of the Court of Appeal. The report was adopted unanimously.

THE WEEK.

ING on the report of Sir R. ROWAND ANDERSON, D., which recommended the plans prepared by Mr. D. CARÔE, F.S.A., the council of the University College of South Wales in Monmouthshire on Monday adopted them. The buildings are estimated to cost 224,355 $\frac{1}{2}$ l. The site has been granted by the Corporation of Cardiff and is in Cathays Park, in which public and municipal buildings stand. There will be a court having an area of 200 square feet. The blocks are arranged about it for accommodation of the arts department, the VIRIAMU memorial research laboratory, public health department, library, physics wing, women's department and a hall to seat 1,190 persons. The whole is designed to be architecturally in harmony with the other public buildings in the vicinity. The scheme permits of the erection of buildings in sections, and the proposal is to proceed on as possible with the arts department and to postpone the building of the remaining blocks, estimated to cost 140,942 $\frac{1}{2}$ l., until funds are available. The college has a fund at present amounts to 70,000 $\frac{1}{2}$ l. If the works are commenced within three years the successful contractor is entitled to a premium of 200 guineas.

THE city of Nancy being so close to the border, it has the French Government as well as the municipal authorities to keep it in a condition which will make it a pride of the whole country. Since the war its population has been almost doubled. Several new buildings are evidence of increased prosperity. But time is pitiless, and old buildings erected when Nancy was the capital of France manifest its operations. A great many of the inhabitants, whatever may be their religious belief, must be made to see workmen engaged in taking down the tower and belfry which surmounted the sanctuary of the town of St. Léon. The operation should have been performed some years ago. But in a case of that kind it is considered unwise to wound the susceptibilities of the public. The structure was made the subject of a careful examination by architects from Paris and elsewhere, and they were unanimous in concluding that it must be removed within a limited time. The period was extended to the utmost, and the demolition now in progress was not delayed until signs of a collapse were too manifest to be resisted.

In descriptions of storms in cities and towns in England it is usual to confine the attention to the effects on the parts of buildings. But owing to the weakness of the metropolitan main drainage system the truest account of inconvenience suffered on such occasions would be derived from an exploration of basements if any one could be induced to have the courage to attempt the task. Kensington is supposed to be a Royal borough, an old Court suburb, and people at a distance may imagine it to be exceedingly picturesque in all parts, but no inhabitant of it can anticipate what injury he is liable to suffer from the drains. The basements may now be considered as of monthly occurrence. There were floodings in June, July, August and September. We shall notice only the last. According to the report of the medical officer of health storm-water and sewage were forced visits into 881 houses, and it is not certain whether the number was not much larger. In thirty-four of them laundry-work was carried on; fourteen basements were flooded, sometimes to the depth of 10 feet. The living-room in a lodging-house was inundated to the depth of 2 $\frac{1}{2}$ feet. The owner of a house says that although the boards may be removed and cleaned the walls remain saturated with water. He adds:—"I, with workmen at my disposal, have been a fortnight trying to get the house fit to allow me to see it, and habitable, but feel that I am not fit at present in trying to get anyone to live in it. That of others more helpless, and who are living in the midst of it? . . . If the sewage does not happen to stop the drain of a favoured house, it pours through

the party walls from the next." But Kensington, it appears, is not the greatest sufferer. The cause is undoubtedly owing to the inefficiency of the main drainage, but whether the pumps, or the pumping station, or the main sewers or all combined originated the misfortune, is known only to the County Council. It was anticipated that additional pumps would be in operation at the end of September; but, judging by experience of the Council's operations, it is reasonable to imagine that the damage of the October floods will be unprecedented in extent. Perhaps the main drainage committee have assigned their responsibilities to the works committee, for then it would be easy to comprehend how catastrophes arise.

IN June 1900 the Corporation of Glasgow granted permission to the Caledonian Railway Company to carry the station buildings across Argyle Street, on the understanding that the roof was not to be more than 18 feet above the rail-level of the bridge. When the usual character of railway structures is considered, that was a generous concession. It is now found that the requirements of traffic need a more colossal mass, and a majority of the members of Council have agreed to the roof-line being 68 feet above the rail-level, or as high as the chimneys of the buildings on each side. The prospect in Argyle Street will be undoubtedly changed for the worse, but on the other hand the vast number of citizens who use the Central Station will find more convenience through the alterations which can be carried out. It is also said that the perspective of Argyle Street was doomed when the railway was allowed to pass over it. The railway company when erecting the station and hotel showed a desire to avoid any diminution of the amenity of the city, but the exigencies of traffic must be met, and there is no other solution except that agreed upon between the company and the Corporation.

WAGNER was a native of Leipzig, and although he lived in several cities he appears to have avoided Berlin as if it were uncongenial to him. It was, however, right that the capital of Germany should have a memorial of a composer who gained renown for the Fatherland. Although his fame is almost universal, it is possible his countrymen alone are fully able to understand the full meaning of his works. It is on that account, we suppose, they are somewhat disappointed with the memorial by Professor EBERLEIN, which was unveiled a week ago. WAGNER's figure, which is seated, with the right hand clenched on a piece of music while the forefinger of the left beats time, does not correspond with the ideal which was derived from the master's compositions. The original arrangement with a throned muse inspiring the musician is now supposed to be more suggestive. The subsidiary figures are preferred. They are WOLFRAM THE MEISTERSINGER, TANNHÄUSER, BRUNEHILD, SIEGFRIED, a Rhine maiden and ALBERICH. But the diversity of attitudes distracts the attention, although after a time there may be a more general acceptance of the necessity of so much variety.

SOME surprise was felt by archaeologists when it was announced that the University of Chicago had obtained the requisite authority to carry on explorations in Babylon. To their simple minds the news seemed to be equivalent to a conflict between Germany and the United States, for it was well known that German explorers had been digging in or about the spot assumed to be Babylon in a systematic manner. It now appears that the error arose from confounding the word Babylonian with Babylon. Representatives of the University of Chicago have obtained the privilege of carrying on excavations in the Babylonian territory. But the site will be at some distance, and in a southerly direction, from the ancient city. The circumstance that American archaeologists are seeking after antique cities in so remote a district is creditable to their enterprise, and everybody will hope for their success. What makes their effort more remarkable is the contrast offered between the enthusiasm of the people of the United States to take a foremost position in researches of the kind and the general indifference shown to antiquity in England.

ENGLISH ROADS.

WE suppose it is owing as much to education (using the word comprehensively) as to any other cause that people in England have become more exacting than their predecessors. There is dissatisfaction with most things, for we have vague notions about the possibility of their improvement, and hence so much grumbling arises about the condition of English highways. Not so many years have elapsed since they were supposed to be suitable for the purposes of travel. Perhaps no roads in Europe were so often made the subjects of pictures as those in England. Now we find discontent among the people who use them, and it is doubtful whether any officials lead less enviable lives than road surveyors.

The true cause of the discontent is the insufficiency of the expenditure on repairs. If we assume that the average outlay is about 70*l.* per mile a year (in some places it reaches ten times that amount), that sum might seem to the inexperienced to be adequate to all requirements. With a continual increase in the price of labour and materials a larger outlay is however necessary. Rates and taxes are already so high, alarm is excited by the thought of adding to them. It is therefore supposed that the money could be applied more wisely, and there is a demand for a change in the authority controlling the repair and maintenance of roads. The county authorities are believed to have an excess of duties and cannot be aware of the defects of roads which may be far from the county town. Accordingly it has been proposed that the responsibility should be handed over to district councils. In that way it is possible a more exact local knowledge would be applicable. But the question must arise whether, on the other hand, the increased proportion of superintendence and plant required in a small area might not exceed the economies in labour.

In order to arrive at some general knowledge about the true condition of the roads and to discover if possible what amendment in the law and administration is desirable, a departmental committee was appointed by the Local Government Board last March. The inquiry was of twelve days' duration, and a large amount of information was elicited. In the first place, it became evident there is some difference of opinion about the character of many roads and the responsibility for their upkeep. Main roads and bridges are supposed to be maintained and repaired by the County Council. But an urban authority can claim to retain the powers and duties of repairing many roads within their district. It thus happens that in the majority of cases urban authorities look after roads, while county councils supply the funds. The consequence is the existence of 1,855 highway authorities in England and Wales, exclusive of twenty-eight for London. In one instance in an area having a radius of less than five miles there are no less than twenty-five authorities. What is known as the Great North Road is operated on by seventy-two authorities, each, no doubt, holding a separate theory of the most efficient and most economical method of maintenance, and with the fullest liberty to exercise it at the cost of the inhabitants.

The departmental committee could not fail to realise that when the work is on a small scale, as in the undertakings of some rural and urban councils, it cannot be accomplished as efficiently and economically as with the authorities of large districts, who have qualified road surveyors, steam rollers and expensive plant. The conclusion should be inevitable that the duty of dealing with roads had better be withdrawn from the smaller councils. But such is the love of power in this country and the fear of the results of vigorous opposition, the committee have not the courage to recommend any change of the law which would be displeasing to local sentiment. The more important roads in the country, they are compelled to admit, should be considered as outside local sentiment. It is therefore suggested that county highway boards should be appointed, who would be responsible for county roads. Some, however, are of such general importance, being trunk roads, they ought to be regarded as of national concern, and be under the supervision of a central department in connection with the Local Government Board. It is considered that the new officials would also serve as an advisory body in case of dispute between highway authorities. The committee add:—"If it were empowered to devote part of the funds at its disposal to

the payment of a portion of the salaries of surveyors engaged in the work of maintaining main roads, it might well be invested with the right to approve the appointment of such surveyors." But that would mean the withdrawal of a privilege which is esteemed by all who exercise a life brief authority in urban and rural districts.

Originally most roads were made too narrow. The initial error entails a penalty, for in the neighbourhood of many large towns there is a frequent congestion of traffic. This is due partly to the increase of traffic, but also to the absence of alternative routes, the appropriation of space by tramways and light railway lines, the tearing up of roads for repair of pipes, and want of authority to regulate traffic. To provide a remedy by widening existing roads, or providing alternative routes, would be costly. The inclination of district councils to undertake the expenditure which would fall on a limited number of people, it is believed, could be removed to a considerable extent if the matter was in the hands of county boards. In other words, few improvements are to be considered as local. The question is complicated to some extent by the vagueness of what is presumed to be a line of frontage which is adopted. Buildings are erected as nearly as possible to the existing road, and their presence adds to the costliness of widening. In a colliery village there may be as many as 150 cottages appearing suddenly as an exhalation, and the road authorities cannot prescribe the line they are to follow. The committee consider that 20 feet from the centre of a county road would be a reasonable minimum, and any additional width required to increase that distance could be obtained by payment of compensation. It may here be remarked that there appears to be no evidence to suggest how the width of English roads was originally determined. To avoid duplication of authorities to whom building plans would have to be submitted if the proposed changes were approved, district councils should be required to report to the county highway authority whenever plans appear to show that buildings are to be placed too near the centre of the road. On the subject of alternative routes, or, as some will call them, "by-pass" roads, the following suggestions are offered:—Where new roads for the development of building estates are being constructed in the suburbs of such towns much could be done in the provision of alternative routes if the makers of such roads were required to comply with the matter of the direction and levels of their roads without reference to a general plan. At present, except in certain localities, there exists no power to compel such compliance. It is obvious that compliance with a general road plan would in many instances prevent the owner of a building estate from developing his land to the fullest advantage. In such cases full compensation should be provided for. The plans should be submitted to the highway authority. In other cases, where authorities should have power to acquire land for a road. Excellent as the by-passes would be in theory, in practice, the attempt to alter the course of traffic would be sure to lead to revolts by the inhabitants of the old-fashioned streets. In Brussels we see an object-lesson of a similar kind. Some hundreds of plans have been proposed to obviate the inconvenience of the Montaigne de la Woluwe, but neither the municipality nor the Government have the courage to interfere with the shopkeepers.

It is held that permission to lay railways on main roads has been granted without sufficient consideration. The committee recommend, except in very special circumstances, that no tramway or light railway should be laid down upon any road which has not, or will not have when the works are completed, a minimum width of 33 feet for a double line of rails of ordinary gauge, and 27 feet in the case of a single line. Where roads are narrow or congested with traffic the railways should be laid in lands prepared for the purpose instead of on roads. To put a stop to the indiscriminate opening of roads for the laying of pipes, it is said that notice should in every case be given to the highway authority. The restoration of the roads to their original condition should be done by the highway authority, and the cost not only of the restoration, but also of any additional repair of other roads rendered necessary by the diversion of traffic, should be recoverable from those who are responsible for the opening.

Traction engines occasionally cause harm to road faces, especially in certain conditions of the weather. The witnesses suggested that they should not be allowed to pass at times when there is risk. But the committee say there is a difficulty in finding officers capable of deciding such a point. They think, however, that damages ought to be recovered for any injuries to the roads. Questions often arise about roadside wastes which frequently mar picturesqueness to roads. The suggestion of the Monuments and Footpaths Preservation Society is adopted,—"That the county courts should be empowered to settle the question of what land forms part of a highway or waste of such highway, on the application of the highway authority, or of a specified number of ratepayers. The judgment of the county court should be subject to appeal on points both of law and fact."

The majority of English roads cannot be said to owe their manner of construction to any definite system. They present no doubt a series of improvements from the primitive track over the ground, but it is now realised that roads which will be equal to modern requirements—and some of the future are sure to be more exacting—should be more than a superficial consistency. What TELFORD in Wales is not too elaborate. Colonel CROMPTON, explained to the committee that in South Africa he had better roads than those commonly found in England. They had to sustain heavy traction engines and waggons. Therefore was careful in his foundations. The principle, he said, "is to distribute the load conically over the mass of subsoil; you do not want all the strains to go particularly down so as to punch a piece right out of the pavement, but you want to spread it over as wide a base as possible." To adapt English roads to correspond with that principle is no simple task, and the expense is to be reckoned. But with so old a country there must either be a succession of difficulties or extraordinary expenditure.

THE GROTESQUE IN ART.

THE limitation of human capacity is in one class of work exceedingly remarkable. Great wonder was excited when CUVIER and OWEN out of a few bones were able to indicate the character of the animal to which they belonged. Their success was due to their recognition of the principle of unity observed in the construction of beings of different classes. The bone of a colossal sloth of an ant type having some analogy to a corresponding bone of a sloth, it was easy to conclude that the remaining parts of the skeletons and the external appearance of the animals must have had some resemblance. Although they possessed such marvellous powers of identification and comparison with all details required for comparative zoology, neither CUVIER nor OWEN tested their abilities in creating on paper or in modelling-clay any new variety of animal life.

They were of opinion, we suppose, that science was to interpret nature and not its rival. If they failed in producing a new animal that would appear to the general public to be consistent in all its parts, their reputation would be damaged and their reproduction of wholes from fragments afterwards be accepted with diminished confidence. There was less restriction on artists. From a very early time they tried their hands in creation. Sphinxes, centaurs, griffins, human-headed lions and bulls and other compounds of diverse animals are evidence of their efforts. In a popular sense the figures may be considered as expressive, but in a scientific sense the figures may be considered as ridiculous. The experiments in physiology they are ridiculous. The Greek artists looked on combinations of human heads with the necks of horses and the wings of birds by the painters of the time as absurdities which corresponded with those admitted by poets and other writers whenever they departed from nature. A comic subject, as he said, should be treated in tragic verse nor the feast of THYESTES should be treated in a familiar metre. When poets, painters and sculptors failed to keep nature before them they surrendered to a bad sense and, as HORACE thought, made themselves ridiculous.

The Greek artists in Rome continued to play with grotesque forms in spite of his and similar censures. The

Assyrian and Egyptian monsters were offensive because of their seriousness; but when it was made evident that the artist was in a playful mood then the creation or combining passed into a different category. Living beings furnish the most beautiful lines which exist, and it would be a loss if they could not be employed because of the opposition of experience. A dolphin is an embodiment of force and agility. It surely was not a great offence to lengthen it by the extension of the tail into an ornamental form more or less in keeping with the lines of the head and body. Mr. RUSKIN once pointed out the superiority of a Lombard griffin to the ancient Roman one. While the latter placed its talons on a flower in such a way as not to ruffle a petal, the Lombard beast was rending into pieces whatever it encountered. It would be an error perhaps to say that the more modern sculptor did not realise the object of ornament, for there may be occasions when a suggestion of tragedy is permissible. But the old Roman or Romano-Græco sculptor was indifferent to tragedy, so he pleased himself as well as the spectators by introducing an animal manifestly harmless. It surely is allowable to occasionally look on life as if it had other aspects besides those which were tragically earnest, and, whether rightly or wrongly, that has been the effort of ornamentists in all ages. To afford pleasure being their aim, they left serious subjects to artists of other classes. Some of them might, like NICK BOTTOM, possess ERIC'S vein, and at times could make their lions roar like a cataract, but in ornament their lions roared as gently as any sucking-dove or any nightingale.

There came a time, however, when it seemed to be impossible to make the world believe that lions and other animals could be without cruelty even in a representation, and that serpents could form fine curves without any suspicion of danger. It appeared as if the earth were invaded by enemies who arrived from some remote planet. Rome, which had once been mistress of the world, was falling, and the tributary cities were wasted by pestilence, or the sword, or famine. If we are to believe some contemporary records, nature herself assisted in the destruction by earthquakes. We have then a long period of ornamentation which seemed to express terror. The serpent was taken as the most fitting emblem, and from the south and east of Europe to the north we observe suggestions of it in the convoluted lines, of which some of the developments are supposed to be peculiarly Celtic and Scandinavian. When in course of time the invaders were partly civilised, we see grim figures with enormous mouths and fangs feeding on lambs; griffins like those which Mr. RUSKIN admired, and much else which suggested that it was inspired by nightmares, but became indicative of what the world had passed through. Is it any wonder that sometimes amidst the darkness which seemed to be the downfall of all civilisation the figure of the Sun-god was used as if it were an augury of a brighter state of affairs? The disturbed condition of men's minds is evident when we find it recorded that ANTHONY THE HERMIT, in seeking for a brother solitary, encountered a genuine centaur who threatened him with his arrows, but was converted and served the stranger for a guide. There was a revival of the old grotesques, for they appeared to be fitting denizens in a world which was out of joint. The centaurs held possession of the imagination for a longer period, for DANTE describes meeting with them in his adventurous voyage.

To whom are we indebted for a restoration of the belief in grotesques as decorative elements in which an artist's imagination could be exercised without being subjected to severe criticism? A painter might take up an impossible task if he attempted to represent the story of ANDROMEDA, for human powers, at the time at least of the Renaissance, were not capable of creating a sea monster which would excite terror. The age had become sceptical, and was likely to laugh rather than tremble. VASARI gives the credit to MORTO DA FELTRO, a man of a melancholy temperament who seemed to find a congenial pleasure in wandering among ruins, and especially those which might be considered as almost subterranean. Evidently he had formed an idea of his own about ancient ornament. But until he had painfully copied innumerable examples he did not feel justified in making an attempt at working in the same style. He thought he had not the genius

requisite for a painter as the word was then understood, and never, it is believed, attempted the figure unless on a small scale in medallions. The praise which VASARI gives him deserves to be perpetuated:—

Morto da Feltro restored the practice of executing arabesques more nearly to that of the ancients than any other painter had done, and for this he well deserves enduring praise, the rather because it is to the commencement made by him that we are indebted for the beauty and perfection to which these works have been brought by the hands of Giovanni da Udine, and by other artists now distinguishing themselves in that branch of art. For although it may have been by Giovanni and others that these decorations have been brought to their ultimate perfection, yet it is not to be forgotten that our first thanks and commendations are due to Morto, who was the first to discover and restore the kind of painting called arabesque and grotteschi, seeing that they were for the most part hidden among the subterraneous portions of the ruins of Rome, whence he brought them, devoting all his study to this branch of art; we all know, moreover, that it is not difficult to make additions to and improvements in a thing once discovered.

The word "grotesque" appears to have had in VASARI'S time, as in our own, a suggestion of absurdity or comicality, and therefore "arabesque" is used as if it were an equivalent, which, strictly speaking, it is not. Mr. RUSKIN would prefer phantasmal. There is no doubt the revived mode of ornamentation was quickly employed not only throughout Italy, but in other countries, and to some extent in England. But the influence of HORACE had not been without its effect. GAUTIER, when describing the works of certain of his countrymen who were representative of the grotesque in literature, says that Frenchmen who are so fond of perilous situations have always conserved the most profound respect for rules in literature and, he might have added, in art also. The great struggle between romanticists and classicists in which he was one of the foremost combatants was simply an effort to determine whether the maxims observed at one time were to be binding on future generations as long as the world lasts. It is therefore easy to realise why the grotesque in ornament, which sanctions liberty often to a considerable extent, has received much opposition from French authorities.

The grotesque is supposed to be only capable of pleasing the eye for a moment but cannot secure the attention. It is a capricious dealing with men and animals and an indifference to nature. It is difficult to be always following nature without becoming formal and, as we said at first, creative powers are denied to us. There is no other course open to man but to make combinations possessing at least the attraction of novelty. It may be that occasionally French cleverness was anxious to perpetuate itself and grotesques have been formed by them on a scale unwarranted by Roman or Italian practice. There is no doubt also that arabesques have been executed in carving, and in such a way as to obtain a reality which seems to be contrary to the intentions of the ancient designers.

We may, in fact, imagine with a good deal of reason that the use of arabesques is founded on a misconception, a fallacy. The Egyptians covered their columns, walls and other objects with hieroglyphics which became eloquent of history and purpose. When the Romans saw the strange signs it was natural to conclude they formed no more than a remarkably varied and fantastic surface decoration. There is a remark in PETRONIUS which would suggest this. He sneers at contemporary artists for imitating a style similar to that of the Egyptians. We are not able to realise from actual examples how far the Roman grotesque when used as wall decoration resembled the multiplicity of figures employed in Egypt. But on looking at decoration like GIOVANNI DA UDINE'S in the Vatican, there is so amazing a variety of forms and so little coherence between them as to recall the peculiar character of the painted and carved language of the Egyptians. We do not see representations of similar objects, but rather a translation into another kind of symbols; the difference being that whilst the Egyptian examples can be interpreted, no YOUNG or CHAMPOLLION

has been discovered who can impart meaning to the grotesques we see in the Loggia of the Vatican and elsewhere.

We know from the severe judgment passed upon them by VITRUVIUS that grotesques won favour in Roman times and were introduced not only for the decoration of walls but in various other ways. Columns were employed which were of the form of reeds with capitals, showing papyrus twisted and turned in an unnatural manner. There were candelabra which carried little buildings from which branches issued, and on the branches were figures. Sometimes the branches bore flowers, out of which sprang the figures, some with human heads or with the heads of animals. VITRUVIUS said it was contrary to experience that reeds should sustain a roof, that a candelabrum should produce buildings and delicate branches carry figures. However, he adds, there is nobody to condemn these absurdities. They please people who never ask themselves whether such things are possible or not, and he adds, if he were acquainted with the Horatian precepts, that on his part he could not find satisfaction in anything that was not true, and he was indifferent to execution so long as the design was contrary to good sense.

If VITRUVIUS or HORACE could have taken a journey eastwards he would have found the further he advanced that the grotesque was more in favour. The Chinese were then admirers of art, and they found delight in weird representations, in which common sense was violated as much as in the new works which gratified the Romans. Is not the grotesque also prevailing among the works of the Japanese? Some of the figures may be derived from nature, but it must be acknowledged that a great deal of liberty is taken with the original models. Art of art which has afforded satisfaction to people over a wide area of the world's surface and for so long a period cannot be entirely evil.

A BIRMINGHAM ART SCHOOL.

A DESCRIPTION of the municipal art school appeared in the *Birmingham Daily Mail* of Friday. It says—life of the classrooms varies. There are students who attend in the morning only, others who attend in the afternoon, many more who attend only in the evening, after their work in the manufactory, studio, office or school; whilst a considerable number devote for a few years practically their whole time to the work of the school. Many of the present teachers and lecturers are former students. Mr. Charles Morley, for instance, the second master, was, with his brother, an engraver to the United States Mint, a student years ago in the elementary room are placed not only plants and animals but casts from horses, dogs and fishes, and geometrical objects, and there is a print from six blocks cut on cherry wood throughout the work of Mr. John D. Barten, the well-known illustrator of fairy tales. In the adjoining room Mr. J. H. Meteyard, the painter of figure subjects, teaches the application of flat surfaces, gesso, leatherwork, &c., and supervises the execution of working drawings on paper, mornings, three afternoons and five evenings a week.

When we have left the lecture-room, what means the cooing of pigeons in our ears? It means that living birds and rabbits are placed—alas! inevitably, in cages—for student work from. A student once lent her horse for a similar purpose, and before now a tree has been dug up by its roots and brought wholesale to the school. When the Japanese wishes to introduce into his design an animal or a bird or a fish, he forthwith draws one from nature, if practically possible; any rate, finds, if he can, a drawing of one which he has previously made from nature; it is the practice, as far as possible, to give to students in Birmingham the opportunity of doing the same thing.

Mr. F. G. Garrett teaches bookbinding on four evenings a week. He teaches his students how to carry their books through from sewing to finishing. Next we go to a room in the daytime by free admissioners from public elementary schools. Here they are taught to draw and model; the young craftsmen trained in the school usually experience difficulty in obtaining suitable situations. The metalwork drawing-room and the rooms for metalwork and enamelling are on the same floor. Gas stoves and other appliances are provided for enamelling; benches, vices, brazing hearths, other requisite materials are here for carvers, chasers, engravers, mounters, setters and repousse metal workers. The metal worker of Birmingham is

portunity to learn not only how to give to buttons, cups, caskets, vases, brooches, hatpins, trays and pans grace and glimmer of romance, but to go further if he possesses the taste.

The work of Mr. Benjamin Creswick, who teaches the morning and evening classes in modelling and modelled work, long ago attracted the attention of John Ruskin, who urged for him to work at Coniston under his own eye. Mr. Creswick's best known works are, perhaps, Heath's, the sign in Piccadilly, London, and the frieze at the Arts and Crafts Hall in Warwick Lane, London. He also modelled the panels on the new wing of the Art School in Cornwall. He is, too, a modeller for metalwork and other purposes. Students are taught to model in clay and wax, from photographs, casts and other examples, and from the living model. They are also taught casting in plaster and in bronze.

In the practice of stained glass it often happens that one does cartoons, another traces them on the glass, a third makes the pieces together. In the room for stained-glass work students are enabled to learn the whole of their craft. This room contains a series of drawings made by Mr. Henry A. Gurney, the teacher, of famous windows at Fairford, New College, Oxford, the Priory Church, Great Malvern, and All Saints Church, Brighton, specimens of Ford Madox Brown's windows, and three stained-glass windows, on loan from Mr. F. Holliday, designed by Sir Edward Burne-Jones, and executed by Morris & Co. Mr. Payne painted the panel "The Visitation" next to the organ in the town hall, Birmingham. He also one representing Leland's visit to Birmingham. Recently he has supervised the redecoration of Earl Beauchamp's private chapel at Madresfield.

The room for writing, illumination, and heraldic drawing is used in the morning, afternoon and evening. Ruskin says:—"The right use is the foundation of the art of illumination. Perfect illumination is only writing made lovely; the art passes into picture-making it has lost its dignity and its beauty. But to make writing itself beautiful—to make the use of the pen lovely—is the art of illumination." The work in this class is especially useful to the painter and bookbinder, but knowledge of lettering and heraldry is valuable not only as well as in many local trades. In the study of antique and antique rooms are casts from famous heads and figure subjects, including the "Hermes," "The Venus de Milo," Donatello's "St. George," Lucca della Robbia's "Singing Boys"; there are also reproductions from the portraits of Holbein, and now at the Art School. Morning, afternoon and evening classes meet in this room. Most of the rooms in the schools are used for various purposes in the daytime and evening.

The room with the oriel, which one can see from Edmund Street, is used in the morning and afternoon for needlework and in the evening for architecture and kindred subjects. It is hoped that, in these days of architectural eccentricity, architectural students of the school may continue to catch the spirit of quietude and thoroughness which characterizes the study of needlework. Miss Mary J. Gurney, the teacher of needlework, is well known as a member of the Arts and Crafts Exhibition Society. Ladies may here learn how to make articles for personal or domestic use. Embroidery, including Church work, is also taught; and a G. McKeon attends specially to assist in teaching needle-making. In this room are kept the examples of work received on loan from time to time from the Victoria and Albert Museum, the photographic reproductions of needlework, and some careful water-colour drawings by the late F. Hunter, of well-known examples of needlework, drawings in which she has so caught the texture of the work that we may at first imagine that we are looking at an example of needlework instead of at a water-colour drawing. The other end of the room are casts and photographs of the history of architecture—the mother of the architect. During the past decade no lecturer has done more to raise the credit of the school than Mr. W. H. Bidlake, M.A.,

the room for drawing and painting from the life is at the end of the building. Mr. Edward S. Harper, the portrait painter, teaches here in the morning and evening classes, and gives lectures on anatomy. On the walls are exhibited some reproductions of Burne-Jones's figure studies, some photographs from paintings in the National Gallery, and, in the foreground, a figure painting by Mr. W. A. Breakspere, and some drawings by Mr. Arthur J. Gaskin, done whilst at the school.

The work of the art school thus embraces many subjects and many experts. A young lady may study there in the morning, drawing and painting, and thus add to her powers of expression, and enhance the interest of her work, or she may learn a craft—say needlework—and thus acquire useful things; in either case her taste may be improved, and she may become at least a discriminating purchaser. A

young architect, manufacturer, or craftsman may work there under men whose business it is to study and to teach the best that has been, and is, thought and done in their respective arts and crafts. A craftsman or modeller may attend there in the evening and develop his skill. Anyone with a gift for an art or craft may cultivate that gift. Teachers in the elementary or secondary schools may continue their studies, and thus keep in touch, as many of them do, with the advancing requirements as to art teaching in public schools. "The main object of the school," according to the programme, "is to make workmen better workmen." In making them better workmen, it undoubtedly helps at the same time to make them better men. It is, indeed, in the local workshop or studio or office that the student usually finds his lifework. Some names of ex-students have, however, been in the foregoing notes. Mrs. Allingham, the water-colourist, and the wife of William Allingham, the poet, was for a time a student. Amongst painters, Miss Myra L. Bunce, Miss Kate E. Bunce, Messrs. Walter Langley, R.I., W. J. Wainwright, A.R.W.S., Charles M. Gere, Oliver Baker, A.R.C.A., R.E., F. W. Davis, R.I., Edwin Harris and Joseph E. Southall may also be mentioned. In book illustration and decoration the school has trained workers in varied styles, including Messrs. Edmund H. New, J. Finemore, R.I., R.B.A. (of the *Graphic*), and H. R. Millar, Miss Gertrude M. Bradley, Mrs. Arthur J. Gaskin, Mrs. Charles S. Green (née Miss Winifred Smith, niece of Alderman Sir James Smith), Mrs. Percy Adams (née Miss H. Isabel Baker), and Mrs. E. P. Nicholson (née Miss Cecilia A. Levatus). Mr. Arthur J. Gaskin, the metal-worker, and the late Mr. G. W. de Saulles, until recently the engraver to the British Mint, were also students, the latter in the evening classes after his ordinary day's work. Many of the best known local architects have been students, including several winners of honours at the examinations of the Royal Institute of British Architects; the architect (Mr. Bidlake) and the builder (Mr. Pitts), of the Moseley Road Branch School of Art, are both ex-students. Several ex-students are now headmasters of schools of art in various parts of the country; at least two have been assisted in their preparation for high office in the Art Department of the Indian Civil Service; others are teachers of drawing at the King Edward's High School for Girls, at the King Edward's Grammar Schools for Girls at Aston, Bath Row, Camp Hill and Summer Hill, at the Edgbaston High School for Girls and at the Church of England College for Girls, Edgbaston; and still more are teaching at Harrow, Charterhouse and other public schools. Altogether, the present students, day and evening, have much to encourage them in their work, under the able headmaster (Mr. R. Catterson-Smith), himself an artist and craftsman, who was in constant personal touch with two of the greatest art workers of the nineteenth century—William Morris and Burne-Jones—and whose teaching experience has been alike varied and successful.

TESSERÆ.

Early Scene Painters.

ENGLISH artists, having seen the capabilities of scenic representation as executed by French painters introduced by Sir William Davenant, sedulously endeavoured to render the British stage comparable with that of Paris. Streater, a landscape-painter and a great favourite of King Charles, subsequently designed many of the scenes for the theatre in Dorset Gardens. Robert Agas also, a contemporary landscape-painter of repute, both in oil and distemper, and well skilled in architectural design, painted several scenes for the same stage. The most able scene-painter that England had produced up to the period of the early part of the eighteenth century was the celebrated George Lambert, then denominated the English Poussin. This lively genius, the founder of the Beefsteak Club, was employed as principal scene-painter to the Lincoln's Inn Fields theatre, under the management of his friend Rich. It was on the removal of Rich's company to the new theatre in Covent Garden, erected in the year 1733, however, that the effect of stage scenery and machinery was first beheld in full splendour; for the pantomime was there, for a succession of years, brought out in scenic glory. Lambert, who had a dispensation from Rich to render the stage as imposing as the collateral aid of painting, machinery and costume could raise it, wrought day and night in his vocation; and such was the interest which his ingenious operations created, that the scene-room became the favourite lounge of noblemen and men of fashion; and the Beefsteak Club was instituted therein for the pure whim of eating a relishing steak hot from his German stove, and the enjoyment of his lively conversation and his wit. Lambert, who was candid and open, having the interest of his friend Rich always prominent in his thoughts, proposed to unite Signor Amiconi, a celebrated Italian painter and decorator, with him in the scenic department. The union was beneficial to all parties, and Covent Garden stage, through the spirit and

liberality of the manager Rich and the talent of his scene-painters, acquired the reputation of being the most splendid in Europe. At this period the Opera House, Haymarket, which had been erected by Sir John Vanbrugh, and opened in 1704, occasionally exhibited a rich display of scenic representation. Foreign artists, however, were principally employed in all the internal decorations of this theatre. Whatever merit the scenery department might exhibit, certainly that of the costume was woefully deficient both in propriety and taste, which subjected the management to the formidable joint attacks of the satirists who wielded the pencil and the pen. Hogarth, in his treatise "The Analysis of Beauty," exposed the absurdities and anachronisms of the Opera wardrobe with much graphic point, and was not sparing of his sarcastic humour upon the same management in many of his satirical etchings. The scene-painters in succession, from the period when Garrick appeared at the theatre Wellclose Square, were Ald Oram, in his day a landscape-painter of some repute, who designed for that company, and also a Monsieur De Voto. Jack Laquerre, the son of the painter of that name, who assisted Verrio on the plafonds at Windsor Castle, was an adept in his department of art. Servandoni an Italian, Monsieur French and others, were of coeval date, and were employed alternately at most of the metropolitan theatres. Amongst other foreign artists who practised scene-painting in the British metropolis, Signor Novosielski deservedly obtained public applause. He was also an architect.

The Spires of Salisbury and Bow.

The quality of Grecian architecture is a stated regularity of parts and proportions. Does this render it exclusively Classical? Surely the term may be comprehensive in its application, and equally suitable to every first-class effort, whether its beauty originates in a strict adherence to certain laws, or in a free obedience to the unrestrained workings of nature or imagination. Sir Christopher Wren was insane on one point. He thought lightly of Pointed architecture. And yet in his Grecian steeple of Bow Church and his Gothic spire of St. Dunstan's, what has he done? In his numerous Classic towers at London, as compared with his Gothic tower of St. Michael's, what has he proved? Why he has proved, in spite of himself, the superiority of what he condemned. The truth "would j out." He designed to do wrong, and unintentionally did right. Like other great men, he was open to prejudice—blind to this simple fact that the Grecian style is horizontal in its character and the Pointed perpendicular. The one has its origin in artificial erection, the other in natural growth. The former is a compilation of several principles, the latter an extension of one. To build up a Grecian superstructure beyond a certain relative height is no less at variance with the nature of the style than would have been the action of Bucephalus with the nature of a horse, if he had galloped on his hind-legs only, and had carried Alexander on his head instead of on his back. Let any one examine conjointly Salisbury spire (not the most beautiful of its kind) and the steeple of Bow Church, justly lauded as first of its class. Does not the spire spring from its base of clustered pinnacles like the flower from its leafy stem—a different feature of the same plant? Beautiful now, it seems, as it were, aspiring into a condition of greater beauty—its finials appear like so many thriving buds of promise? In turning to the tower of Bow Church, we acknowledge it as handsome in its parts, but unharmonious in its whole. Imperfect now, it promises nothing better—for its growth is effectually stopped—the sap of the tree is intercepted in several places. The entire composition exhibits four distinct pieces of architecture, which might be separately situated, and with good effect, on the same level in Stowe Gardens. First, we have a quadrangular pilastral tower; secondly, a peripteral temple; thirdly, a polygonal temple; fourthly, an obelisk. These are united it is true, but the union is an especial instance of that harmony which would be produced by striking at once the three adjoining keys of a pianoforte. In short, a Grecian steeple must ever appear a compilation—a thing which, like an old-fashioned spice-box, may be unscrewed and taken to pieces.

Veronese as a Colourist.

Veronese painted with astonishing lightness and certainty of hand; and his colouring was always clear and powerful, because he hit off the tints at once without stopping to perplex himself. Neither did he employ glazing so much as was the custom of the rest of the Venetian school; on which account his pictures are not so liable to receive injury in the cleaning. Like Titian at his best period, Paolo preferred a full display of light and avoided deep shadow; notwithstanding which, owing to his careful observation of the effect of colour and light upon the eye, his figures possess a striking degree of relief. All the parts of a healthy human body upon which sunshine falls directly have a reddish-yellowish hue, which is precisely that which, while it excites the eye, produces the most grateful impression upon that organ. Hence whatever parts are so illuminated and coloured acquire relief and seem to project,

while others which do not receive the rays of light do but are situated obliquely to or turned from them are either by reflection from the surfaces of other objects or light received from the atmosphere, and these reflexes light the parts on which they fall with the hues of the surface rebound from. As such lights are of a blueish cast when they are derived from the atmosphere all objects that are but slightly lighted, or surfaces not immediately exposed to the sun, take of this tint; and this when mixed with the carnation of the flesh produces a light grayish green. But as this latter is a weaker tone than the other, and therefore makes less impression on the eye, such parts seem to retire and appear in demi-shadows, even when really of no darker hue than the parts lighted by the sun. It is this opposition of colour between retreating and projecting surfaces that gives relief to the picture, and as both Titian and Veronese carefully attended to this effect, they were enabled to make their figures appear as tangible without having recourse either to strong or violent contrasts of light and shade. Frequently figures seem quite surrounded with luminous brilliancy, and they are detached from the canvas. Those painters were particularly attentive to bring together such colours as assist each other—such as yellow, blue, red and green—whenever a vivid effect was required, and avoided combinations in subjects that demanded softness and delicacy. Even light objects appear in some degree shaded when placed against a brilliant ground.

Influence of Cathedrals.

The modern architect who has been commissioned to build a church for 300, and, having prepared his ground plan and elevations, is afterwards informed that it will have to accommodate 600, would too often make no further change than by proportionally increasing his plan. But Poore, and Wyke, and Waynflete, and Islip would have gone very differently. They knew that an elevation suitable to a large church would be absurd in a small church. Imagine the sublimity of the front of Peterborough caricatured in a small country church. Or again, look at Tewkesbury and think of its towering arch imitated in a similar manner, or contrast the choir of King's College Chapel with Christ Church, Barnwell. On the other hand, that Early English gem, St. Andrew, Northampton, would, if expanded into a large church, become an unsatisfactory. There are arrangements, too, which are not only a comparative but an actual size to produce a noble effect. In that noblest of human temples, Glastonbury Abbey, the effect of the rise of six steps right across the building, some little distance west of the "Holy Doors," is inconceivable. Yet in a parish church such an arrangement, in proportion to its size, would be absolutely unnoticed. There are, no doubt, examples of the modification or imitation of a church in another, executed on true principles, and frequently occurring in the best ages of architecture. The front of Beverley sprung from that of York, and we must decide between them? They have the same magnificent same peculiarities, namely, the great prominent buttresses. Again, the tower of Gloucester was evincing the prototype of the glorious towers of the West of England. How beautifully is the idea modified in them. Look at St. Mary Magdalene's, Taunton, St. Decuman's and St. Andrew, Lydeard. The latter we think imitatively beautiful, and the same resemblance to Gloucester that the femininity of a daughter might do to the manly beauty of a father. Who can doubt that the Lincolnshire spires had their origin in the spires of the cathedral church, so ruthlessly and partially destroyed? We are bound, however, to say that this was, even in the best times of architecture, not always a good thing. The position of the towers of Exeter Cathedral, awkwardly repeated in St. Mary, Ottery; the reversal of the Wells in Finedon Church. Western façades are more imitated than towers, because their size depends on the church, while that of the tower does not. And yet the portion of the building which is sure to be fixed on by an "idea"

Landscape Sketching.

In the selection of a subject from nature, the student must ever keep in view the principal object which induces him to make the sketch; whether it be mountains, castles, trees, corn-field, river scene, or any other object; the principal of this leading feature in the piece should be duly emphasized throughout; the character of the picture should be derived from it; every other object introduced should be subordinated to it, and the attraction of the one should be the attraction of the whole. The union of too great a variety of parts tends to destroy, or at least to weaken, the predominance of any one. It ought to be the principal in the composition, and the student, when he proceeds to the colouring, should endeavour to characterise by throwing upon it the strongest of his attention to this rule, however, the student must be particular not to fall into the opposite extreme, and

leading object of his composition so fully to engross his
er as to render him neglectful of the subordinate parts.
e they are not to be exalted into principals it does not
that they are to degrade into superfluities. All the
n a picture should be composed of warm tints, except
ll on a glossy or reflective surface, such as laurel leaves,
utensils, &c., which should be cool, and the lights small,
them a sparkling appearance; but care must be taken
ntroduce a cold colour in the principal light, which, as
mentioned, should be thrown upon the leading feature
cture, as it conduces to destroy the breadth, which
be preserved; while, on the contrary, the opposition or
ity of a cool to a warm colour assists greatly in giving
y to the lights. If the picture, for instance, should
cool sky, the landscape ought to be principally com-
of warm tints, as contrast of this description tends to
ental improvement of the general effect. All objects
re not in character with the scene should be most care-
oided, as the introduction of any unnecessary object is
be attended with injurious consequences. This must
e necessity of becoming thoroughly acquainted with
taining a proper feeling of the subject. The picture
be complete and perfect in the mind before it is even
upon the canvas. Such force and expression should be
ad as would render the effect at the first glance
ible to the observer. Merely to paint is not enough,
e no interest is felt nothing can be more natural than
ne should be conveyed. Finally, it may be observed
s only by due attention to each distinct part, and by a
ombination of all, that the whole can be effective.

St. Paul's Cathedral.

ts defects are those of its style and period, but its excel-
are its own. A certain nobleness of conception and
ss of manner prevail throughout, redeeming its
ies and almost overpowering all criticism. There is a
ness in the cupola and fine Corinthian peristyle forming
our that may be pronounced truly classical; the latter,
most happily managed, its contour being preserved
n, while the piers placed within the colonnade itself
an agreeable diversity of plan, of form and of light and
e without cutting up the general outline or interrupting
continuity so essential to simplicity and repose. If we
be the circumstance of the building being divided into two
he coupled columns of the two loggias of the west front
en more objected to than anything else in the exterior,
er hypercritically. Granting that a similar arrange-
columns would undoubtedly be a solecism in the
style, it can hardly be alleged as one in a structure
e harmonises so well with the rest, particularly as the
for adopting it are sufficiently obvious to reconcile us
even had not the width of the large door and window
such an extent of intercolumn, and consequently the
themselves to be placed in pairs, still a conformity
rest of the front and with the other elevations, where
e necessary for the windows rendered wide inter-
a and coupled pilasters inevitable, would have recom-
it as the lesser of two evils. It is true the columns of
semicircular porticoes and of the peristyle of the cupola
paired, but then the difference of the plan in those parts
e of that variation without affecting the ordonnance
reavels elsewhere; in this particular, therefore, justice
een done to the architect.

Boxgrove Church.

sssex, when a church was half-destroyed, they seem
oly to have pulled down the nave and left the choir; else-
s at Waltham, Leominster, Malmesbury, Fotheringhay,
al, Usk, Chepstow, &c., the contrary process was more
ly employed. Of the two evils the South-Saxon one is
ey the lesser, as naves are much more like one another
byteries and lady chapels; even at a west front one can
re readily than at the arrangement of eastern apses
like. Of Boxgrove we have the eastern limb, the tran-
el tower, perfect and considerable ruins of the nave and
ventual buildings. The ritual choir included the two
ays of the nave, and probably the space under the
a solid wall, just like St. Cuthbert's screen at St.
divided it from the nave or parochial church to the
is being carried up to the roof now forms the barrier
e the existing church and the ruins. This last portion
a plain Transitional work, and the nave has no north
ept in a part recently excavated at its extreme west
cloister fitting in, so to speak, into the recess between
and the north transept. The transepts and the low
tower are contemporary, but the original eastern limb
place to a magnificent structure in the Lancet style
uch grander scale, which the tower barely overtops.
peculiarity is in the arrangement of the vaulting,
supposed to be unique in England. It is not easy to
it, but it is something of this kind. All the bays are
e hose of the central space being double the width of

those in the aisles, so that there are four bays in the one and
eight in the other. Consequently, in the clerestory there are
four bays; in the pier range there are eight, which is managed
by making the principal piers much more massive, and throw-
ing each pair of bays into the form of a couplet, just as is
usual in triforia. The principal remains of the conventual
buildings consist of the fragments of a Norman chapter-house
and the residence of the Prior, a Decorated structure, which
was perfect till it was unroofed and mutilated.

Italian Polychromy.

From the beginning of the fourteenth century, polychromy
in Italy may be said to have divided itself into three styles—
the arabesque, the pictorial and the architectonic. The first
was, as we have every reason to believe, in a great degree
originated by Perugino, and was especially affected by his
pupils and their followers. This style, of which the celebrated
Loggie, the Sala Ducale, and the bath-room of Cardinal
Bibiena at the Vatican, the Villa Madama, and some apart-
ments in the castle of San Angelo at Rome, together with
some of the walls of the Palazzo del T, at Mantua, are the
most remarkable examples, was copied closely from the antique.
It consists generally of an arrangement of colour in which a
white ground plays a most conspicuous part, serving as a field
on which are painted, on a small scale, every variety of objects
that can be imagined—figures, fruit, flowers, animals, birds,
fish, landscape, shells, curtains, marble and bronze panels, &c.,
directly imitated from nature, interwoven with scrolls and
patterns of a completely conventional character. Ornament is
heaped up with an apparently boundless profusion, and yet
breadth of style is preserved by keeping such coloured grounds
as are introduced firm and solid in colour, and by so diminish-
ing every object in bulk, as contrasted with the unoccupied
area of the ground colour upon which it is painted, as to allow
that colour to predominate, and at a little distance to appear
rather fretted with a diaper than covered with ornament
demanding attention. The balance in the best examples, as at
the Villa Madama, is so happily maintained that no one
portion of the wall attracts attention more than another, no
one ornament or portion of the wall starts forward before the
rest, and the eye, pleased with a universal richness and
intricacy, as in regarding the decorations of the Alhambra,
wanders delighted, neither oppressed nor confused. Shortly
after the death of Raphael, this beautiful style which, under
his direction and influence had been carried to such successful
lengths, degenerated, and although freely and skilfully
executed by the Zuccari, Tempesta, and other masters down to
the present day, we look in vain in any of their works either
for the same purity of drawing, point and meaning in the
selection of materials for ornament, or breadth of treatment in
colours; in fact, arabesque painting thoroughly degenerated
into mannerism, and the lamp of life was quenched.

Alan de Walsingham.

When sub-prior of the Monastery of Ely in 1321, Alan de
Walsingham laid the first stone of St. Mary's Chapel. The
falling of the great tower of the church afforded an opportunity
for the display of genius in architecture. His idea of a lofty,
spacious, octagonal tower, crowned with a dome and lantern,
in place of the old tower, was novel. He had no model to
facilitate the difficulties of erecting such a structure. The
difficulty did not, however, deter him from attempting it; and
his success in this undertaking is a proof of his superior skill
and an existing monument of his great abilities as an architect,
for that he alone was the deviser of the work, and acted
throughout as principal architect, is clear from the account
that is given of it, and is moreover confirmed by his epitaph.
This celebrated tower was finished at the expense of the con-
vent in 1342, and cost 2,406*l.* 6*s.* 4*d.* Although there is no
direct proof that he designed the plans of St. Mary's Chapel,
Ely, and also of Bishop Hotham's new buildings, yet it is most
probable that these two works are of his hand. The oversight
of St. Mary's Chapel, while it was building, was given to John
de Wisbech, one of the monks of the monastery, who was also
overseer to Alan of Walsingham. That the choir of Ely
Cathedral was begun by Alan while he was sacrist and finished
in his lifetime is known from an eulogium written on him when
he was prior. Besides the great works about the church,
including a most elegant set of stalls for the choir, Alan was
continually making improvements in the monastery, both while
he was sacrist and prior; he nearly new-built a residence for the
sacrist and added to it several apartments. This building, as
a specimen of the Domestic architecture of that period, is well
worthy attention, it having, with two others, undergone but
trifling alteration since its erection. The doorway has a retic-
ulated tympanum, and the transom stone so highly charac-
teristic of the Saxon era; it was the north doorway of the
church. Having enclosed the sacrist's office within a strong
wall, he erected, in the north-west corner, a square building of
stone covered with lead; part of this house he appropriated for
the use of the goldsmiths' work and for other purposes con-
nected with his situation.

NOTES AND COMMENTS.

ON Wednesday Professor F. M. SIMPSON delivered his inaugural lecture in University College, London. After a generous recognition of the services of his predecessor in the chair, Professor T. ROGER SMITH, he spoke about the efforts of the Council to provide a systematic course of education for architects. They were pioneers, and their example would be followed not only in various parts of England, but in America and the Colonies. Professor SIMPSON then traced the development of architecture, and asked what chance had we of a return to the principles of the Renaissance? The principles established by INIGO JONES and WREN were superseded in the last century, but their buildings still remained in evidence of them. As long as architects did not generally recognise some things in common it would be difficult to have progress. The public in consequence of the variety were likely to conclude there was no standard of architecture. The contest between Mediævalists and Classicists was over, but the latter were at war among themselves, and there were still two camps. It would be necessary to have a compromise, with less of pedantry on one side and less playfulness on the other. The difficulty was, however, to find a common basis. Then it would be possible to add another definite chapter to the history of architecture. Mr. ASTON WEBB, R.A., who presided, said he believed in the necessity of harmony to which systematic education was likely to lead.

THE love of competitions seems to be extending on the Continent. Superior artists are eager to have a share in them. Some months ago the city of Berne being desirous to commemorate the foundation of a system of universal postage by a group in a public place decided to organise an international competition among sculptors. No less than 125 models were sent in. After deliberation the authors of six of the designs were invited to take part in a second contest, which is likely to require several months to accomplish. Among the selected artists are M. RENÉ DE SAINT MARCEAUX and ERNEST DUBOIS, whose works are familiar to Frenchmen.

READERS of "Trilby," although they may not have visited Paris, must remember the description of the courtyard of the Grand Hôtel, with its marble steps and magnificent old man in court dress, with a large metal chain, who looks down like JOVE on the coming guests. The author gave a drawing which was to suggest the "atmosphere of bank notes and gold." TAFFY, "the Laird," and "Little BILLEE" shared the common experience of Englishmen and Americans by meeting unexpectedly with friends who were thought to be elsewhere. The court, which is so widely known, is to be transformed, and the directors, recognising the character of the establishment, have decided to open the competition to strangers as well as Frenchmen. The conditions are to be obtained on application, and plans must be sent in on December 15. Prizes of 3,000, 2,000 and 1,000 francs will be awarded to the authors of the three designs considered most suitable.

COUNTY surveyorships are earnestly sought after, as it is supposed the advantages of the office are not to be measured by the amount of salary offered, which is generally moderate. A vacancy having occurred in West Sussex a county surveyor was advertised for, the salary being 250*l.*, with travelling and office expenses. There were no less than 119 applications received. The roads and bridges committee invited the following gentlemen to an interview, viz.:—Mr. ALBERT E. BROOKES (33), assistant county surveyor for Worcestershire; Mr. F. T. JOHNSON (30), surveyor to Ticehurst Rural District Council; Mr. W. MCINTOSH (32), engineer and surveyor to Cuckfield Rural District Council; Mr. C. R. K. NEWINGTON (34), assistant county surveyor for East Sussex; Mr. RICHARD PARDOE (34), main road inspector for southern division of Warwick-

shire; Mr. H. FARR SIMPSON (30), county surveyor Northern Division of Isle of Ely. It will be observed that all have had experience in a similar office. Eventually it was decided to appoint Mr. MCINTOSH.

ILLUSTRATIONS.

HER MAJESTY'S THEATRE, SYDNEY.

For description see page 233.

FENTON (STAFFS) LIBRARY.

THIS design, submitted in the recent competition by Messrs. W. SUGDEN & SON, of Leek, provided the accommodation required and otherwise conformed to the conditions. On the first floor a large committee room with lavatory accommodation were provided with a large square landing over the entrance. The materials proposed to be used were thin Wall Grange pressed facings, with Roche stone dressings to be sparingly used and to portico and upper part of tower roofs to be covered with WILLIAMS'S (Basford) red made sand-faced tiles, which quickly lose their new appearance, in varying shades of green and deep red. We understand the first and second premiated designs were selected by the committee and a local practitioner appointed to carry out the work.

GROVE PLACE, HANTS.

THE beautiful Elizabethan building of Grove Place, situated four and a half miles south of Romsey on the Southampton main road, has had many vicissitudes. Built about 1564, it has sheltered Lord BACON and the Virgin Queen herself; later it was converted into an asylum, and at the end of the last century was used as a farmhouse, sacks of corn occupying the fine old hall. Happily it has now fallen into hands which appreciate its beauty, and the present owners have very carefully restored it as far as possible to its former glories. It possesses panelled rooms, plaster ceilings and stone fireplaces. The two octagonal towers on the south front, built of red bricks weathered to a deep orange tint, contain spiral staircases of English oak, black with age, of which the west tower shows one; the stairway in the corresponding tower is a miniature lift in the well, probably one of the earliest existing. These staircases measure 42 feet from floor to top landing in tower and have three landings, 10 feet being the internal width of the towers. The weight on the bottom newel must be enormous, and stand to-day, massive and boldly moulded, as they were when fixed nearly 340 years ago, a masterpiece in the hands of an Elizabethan carpenter. The illustration was made and drawn by Mr. CHARLES M. C. ARMSTRONG.

THE NEW LODGE, ASHORNE HILL, WARWICKSHIRE.

THE original plain farmhouse at Ashorne Hill, Leamington, has been turned into a small residence by alterations and additions, whilst the original has been cement rough-casted throughout. Old tiles were largely used in roofing the new additions. A vault runs round part of the new work, from which a good light is obtained south and south-west. Parts of the farm buildings were converted into hunting stables. Mr. C. M. C. ARMSTRONG, of Warwick, was the architect.

THE PARK FARM, KIRTLINGTON, OXON.

THE alterations and additions to the Park Farm at Kirtlington, near Oxford, were carried out in 1900. Local stone from an adjacent quarry in the parish was used to match the existing, with red brick arches, and stone facings to the window openings and chimney. Stonesfield slates cover the roof. Mr. THOMAS GRAY, of Bicester, carried out the work under the direction of the architect, Mr. C. M. C. ARMSTRONG, of Warwick.

CATHEDRAL SERIES.—EXETER: SOUTH AISLE, LOOKING EAST.

HER MAJESTY'S THEATRE, SYDNEY.

(See Illustration.)

EN Sydney's leading playhouse, Her Majesty's, was destroyed by fire on Palm Sunday, 1902, after a performance of "Ben Hur" on the preceding evening, it was for no doubtful, in view of the existence of several other in the city—the Royal, Lyceum, Palace, Criterion and whether the place would be rebuilt, especially as it involve an expenditure of between 30,000*l.* and 40,000*l.* ly the trustees of the family to which the property decided on the construction of a new playhouse ng all the latest British and American improvements, use being spared in making it the finest theatre in the wealth. The Hon. William Pitt, of Melbourne, who the Princess's Theatre in that city, was selected as, and instructed to have only three floors, instead of n the old building. This was for the purpose of doing h steep flights of stairs, and increasing the facilities e in case of fire. The approaches to the stalls, dress d amphitheatre are now superior in every way to any in Australia. A magnificent vestibule, with marble leading to the crush-rooms, is one of the main in connection with the entrances. The staircase is ed of solid marble, varying in colours, secured locally, l to any imported. On each newel are two elaborate rs, made expressly by Mr. J. Marriott, Melbourne, igns of the architect. Each electrolier stands 6 feet he pedestals are surrounded with artistically grotesque ads and wings, and the lights are becomingly shaded and graceful perforated stag-horn flowers of beaten The stairway is considerably in advance of any other ate.

h architect has laid down the theatre on different lines many others he has erected by dropping the whole t, thus making it easier of access to the dress circle and iatre. Special provision has been made for all the t the back of the stage, and the dressing-rooms are with the very latest improvements. The paint-room w large paint-frames, each 46 feet in length by a height et, which run the whole length of the stage. Under large scene-dock, capable of holding all set scenes in e on with any production that may be staged. The um has the largest opening of any in Australia, and is d by an asbestos fireproof curtain of latest design, ar: those now used in London theatres. This makes uitorium from the stage absolutely fireproof. Mr. Pitt duced the sliding-roof, of which he was the original r, but which has undergone many improvements since tduction at the Princess's Theatre, Melbourne. The is thoroughly ventilated, and is provided with all y, hydrants and fire-appliances to meet the require- f the city authorities. The blue-plush curtain and icht velvet in which the upholstering is executed and shings of the boxes and crush-rooms lend a very fine nce to the theatre. The whole of the plush and velvet ially imported and made up, together with the fine rs on stalls' floor and circle, by a Sydney firm.

he theatre is capable of accommodating 2,000 people, and e has a full view of the stage. Ample exits in case of provided, which have met with the approval of the horities. The auditorium and stage are lit up with lectric lights, all being controlled by large switchboards mers on the prompt side of the stage. The whole of icular work has been carried out by the Brush Com- Sydney. The decorations have been carried out in nce with the general architectural features of the and in strict accordance with best models of 'the ance style of work adapted to modern ideas, the pre- colours being cream, biscuit, warm brick colour and arying from light robin's egg shade to turquoise, this rading into a soft stony green.

gether the effect is most pleasing and soft, no strong s breaking the general harmony. The sliding portion eome is treated as a curtain, with sky-blue background i: between the sections, having bunches of flowers to e whole together. The dome is divided into sixteen having a raised ornamental rib at intersection. Upon ernate panel are painted groups of musical instruments al colours; four other panels have cupids in centre, g the elements, earth, air, fire and water; while the ng panels represent the four seasons. Underneath e shells picked out in suitable colours. The large arch e proscenium has panels treated to represent tapestry, r the frame enclosing the opening the same idea is out in a rich brocade pattern distributed over the

At the springing of the arch are four large 5 feet in diameter, upon which are painted figures, representing ancient actors, art and litera- usic and dancing. The same delicate treatment inued down the face of the private boxes, the

panels at bottom of pilasters being filled in with fruit and flower subjects upon a gold ground. The framing of the proscenium is intended to represent chased metalwork; this gives a fine solid look to the openings. The ceiling of the circle is panelled out in the same delicate tones of colour, having ornamental cornerpieces, lines and centre flowers. Upon five main panels are painted groups of musical instruments grading from earliest ancient to modern days. The crush-rooms are also carried out with the same careful regard to details in the style and finish of the work. The vestibule at the main entrance is one of the main features of the building, and is executed in tones of straw-vellum cream and blue, having scrolls in high relief upon backgrounds of silver, while the principal projections are etched up in gold leaf. This has a very rich and chaste effect, the colour and workmanship blending very harmoniously with the marbles of the staircase and the rich tones of the various metals used in manufacture of electroliers.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting of the session 1903-4 was held on Friday evening last in the Rooms of the Royal Institute of British Architects, Mr. H. T. Hare, president, in the chair.

Mr. A. Keen was elected by acclamation.

The PRESIDENT proposed the election of Mr. Sudsuki, a Japanese subject sent to England by his Government to study the methods of architectural education in this country, and he purposed afterwards visiting other foreign cities, taking in all about four years to complete his investigations.

Mr. SUDSUKI, who was elected by acclamation, briefly replied and thanked the Association for the honour they had conferred upon him in being made a member of their Society.

The PRESIDENT distributed the medals and prizes to the successful students of the classes and day school, and delivered the following

Address.

When we met together in this room a year ago you may remember that I expressed the hope that I should shortly be in a position to make an announcement that the pressing question of our new premises had at last reached a solution, after having constantly occupied the attention of your committee for many years. Session after session allusion has been made to the subject in the presidential address, and it may well be that your patience and hope have become well-nigh exhausted.

The anticipation is, however, now happily fulfilled, and after long negotiations we have been able to take possession of the Royal Architectural Museum, for so many years located in Tufton Street, Westminster, and formerly housed at the then Brompton Museum.

This fortuitous consummation being reached, your committee forthwith proceeded to the consideration of many proposals for the adaptation of the premises to our needs, were able to instruct their architect, Mr. Leonard Stokes, one of our past-Presidents, to proceed without delay with the work, and to accept the estimate of Messrs. Holloway Brothers. To-day substantial progress has been made, and there is no doubt we shall be able to move into our new home at the end of March next.

I have no intention of wearying your patience with the long and deeply interesting history of the Royal Architectural Museum; that has already been written in part, and now, no doubt, the time is at hand when an authentic and detailed account of its origin and progress will become an obligation posterity may demand. It will be enough to say that it has had a long and brilliant past, and that it is a tangible evidence of the potency of the Gothic revival. Some may here be led to remark that that cult had become effete, that the institution had fallen upon evil days, and was passing away in senile decay. If such were the case it is but a surface truth, which accomplished events have abundantly disproved. True, the Museum had become out of sympathy with its environment through the trend and evolution of architectural progress, in which it had held such a pre-eminent position and exerted such a wide-spread influence.

It is the fashion, in looking back on the Gothic revival, to speak slightly of the enthusiasm which possessed its leaders or to regard that enthusiasm as worthy of a better object. The direct effect, however, is with us to-day in our emancipation from the artistic paralysis of the first half of the last century. The heaven is still working with full and perhaps increasing potency, and the wonderful renaissance is yet only emerging from its shell, and there is promise of such glorious developments as may, perhaps, eclipse the greatest triumphs of the past.

Beneath the apparent desolation of the museum was a latent vigour, based upon our indigenous architectural traditions, destined to successfully receive the graftings of such a

vigorous constitution as that of the Architectural Association, whereby to renew its strength, and with regenerated powers to influence for lasting good our noble profession.

This sketch, I venture to think, is not overdrawn, and while we are accepting new responsibilities we are also investing ourselves with a heritage in delightful associations and replete with potent possibilities.

The interests centred at Tufton Street are one thing, the collections are another, and without going further into that it may be said that the study and contemplation of the contents of the museum and of the cognate studies there represented have had no small part in the great renaissance to which I have just referred.

It will be impossible to adequately refer to the long roll of honourable names linked with the history of the museum, but I cannot refrain from reminding you that among those in the past have been H.R.H. the late Prince Consort, Earl de Grey, Ruskin, Donaldson, Sir Charles Barry, Beresford-Hope, Scott, Cockerell, Penrose, Pearson, Brandon and a host of others; while in the living present we have John P. Seddon, Mr. Aston Webb, Sir William Emerson and Mr. Maurice B. Adams, who for so many years has acted as honorary secretary, and through whose enthusiastic interest the idea of fusion has been translated into a reality.

These are names which, I venture to think, will be for ever connected with the Royal Architectural Museum.

We see to-day noble blocks of Government buildings rising in Whitehall, which strangely seem to recall to memory the hot controversies and battle-cries of the styles which raged when the Foreign Office designs were prepared by Sir Gilbert Scott in a manner alien to his sympathies. In all of this, no doubt, Tufton Street exercised a not unimportant influence. Scott is generally supposed to have vindicated in St. Pancras station what he would have done in Whitehall had he been so permitted by the powers that then were.

The past year has not only been significant and epoch-making by what may be designated as the great departure, but it has been rendered notable by the successful completion of the first year's working of the day school. This is a matter for sincere congratulation, and this fact is important enough in itself to have taken precedence of everything else. However, these two events have come together side by side; the school demonstrating beyond all dispute the inadequacy of our present premises. This climax may well encourage us in the highest anticipations for the future progress of our Society under the more favourable conditions which we shall enjoy in our new home.

After two years of ungrudging labour Mr. Arthur Bolton has, greatly to everyone's regret, relinquished the post of headmaster of the day school, which he has filled with unequalled distinction, and the success which has attended the school is doubtless due in a very large measure to his devotion. To undertake a mastership is one thing, to organise and originate is another. Mr. Bolton has done both. Our ideal has been to give definite and systematic instruction by a one year's course of training preliminary to office work, and, when desired, to supplement this by a second year's course of more advanced study. This instruction is partly intended to enable the student to gauge in a measure before life is too far advanced his capacity, and to test practically his inclination for entering the profession. The latter consideration need not be present, but had it been possible for many now alas! in practice, perhaps some careers would have been happier and architectural repute more unsullied.

The instruction which our day students receive at the hands of the master and his assistants is based on principles which are intended to enable an intelligent interest to be taken in what they will see going on around them when they enter an office, and to assist them to assimilate the knowledge which will be at their disposal if they can but seize their opportunities.

Some of us can recall happy days of long ago, when enthusiasm was high and zeal, often misdirected, outran knowledge. This spirit Mr. Bolton has been able to foster and to direct to sources of wise inspiration. I cannot do better than invite you to inspect the results evidenced by their work, and to come and see the schools in operation for yourselves. The progress so far has been most gratifying, and we shall watch with signal interest the subsequent careers of those students who have had the good fortune to pass through the school. This success is all the more remarkable as having been attained under the very difficult restrictions which the present premises imposed upon us. When we enter upon our new home next year we shall confidently expect to see corresponding developments.

To fill the vacant mastership has been a difficult and anxious duty. I am certain that the selection of Mr. Maule has the full approval of the Association. The responsibilities of the post are by no means light, and whatever the new master's opinion of his own fitness may be, all will agree that no better choice could have been made.

In connection with these two topics, before leaving, I have two appeals to make. First in regard to the day school I take this public opportunity of commending it to the consideration of parents, guardians and heads of public schools as affording an excellent means of testing the aptitude of a coming man for his future profession. Should experience within twelve months that he is unsuited for the calling of an architect, he will have been no loser thereby, but will have gained much information useful in other walks of life, and will have been spared the drudgery of an uncongenial occupation.

The other appeal I have to make is to a wider circle than that represented within this room. I refer to the public at large, which still requires to be largely augmented before we can hope to be free from debt. The work on which we have embarked at Tufton Street is one which is in the interest of every member of our profession; indeed, I do not think I am guilty of exaggeration if I say that it is of national importance.

In every other great country it would be under the heavy subsidised by the responsible government. Here, however, it is left to private effort, and the greater need is therefore for every member of the Association and every person of artistic profession at large to afford the utmost support which the means will allow.

We are honoured by the presence of His Excellency the Japanese Minister, and we have just elected as a member of our Association Mr. Sudsuki, who is visiting many of our members for the purpose of studying the various systems of architectural education and reporting to his Government. This clearly shows the determination which exists in that far distant land to be left behind in the promotion of the arts and sciences, and it appears to me to be an example which our own countrymen well take to heart.

One cannot help hoping that in the extraordinary success which the Japanese Government and people evince to-day in late all that is good in nations foreign to them they will lose sight of the delightful arts which are traditional with us, but that these may be fostered and promoted rather than superseded by the importation of extraneous methods.

The Association numbers nearly fifteen hundred members, and one might reasonably expect that each one of them should contribute to an object which is so much in their interest to the present time, however (although we have to thank the generous donors), less than one-quarter of our members responded to the appeal. I feel that some great effort must be made to bring the general body into line, and I hope every member to follow the example already set by your committee, by doubling the amount of his yearly subscription for this session only. This should be within the means of all, and produce a community of interest which would be for the benefit of all.

The provincial societies have also an interest in this, and very welcome have been the contributions sent to us. I commend the good work heartily to the others, and I hope all persons interested in the progress and advancement of architecture (and who should not be?) as a national art, and ask them to show their practical sympathy by forwarding to assist us to complete the provision of the facilities necessary for the adaptation and enlargement of the Architectural Museum to the purposes of the Association.

We have had to undertake certain financial responsibilities relative to and contingent on the acquisition of the new building and its extension, while in addition to this there will be a considerable outlay in the rearrangement and exhibiting of the valuable collection of casts, which will be open free to the public as heretofore. In regard to the latter we hope to make the collection as far as possible representative, chronological, and useful in every way to students at large.

Many have laboured for the Association in the past, and given ungrudgingly of their time and means. We to-day rely on their labours and continue them. I feel sure I am not appealing in vain, and that the provision of these highly indispensable facilities will not be left to become a burden on the Association and a drag upon its work and progress.

I may perhaps be pardoned for making a very brief financial statement in respect of our new premises. The contract which we have entered into for the remodelling of the Architectural Museum amounts to 8,400*l.*, and it is expected that a further sum of perhaps 1,500*l.* will be required for equipment and furnishing, making a total of about 10,000*l.* Towards this we have donations and promises amounting to about 3,700*l.*, and it is proposed to transfer 1,000*l.* from the capital account of the Architectural Association, making a total of 4,700*l.* We have therefore still to collect more than 5,300*l.* before we can hope to be free from debt.

Death is ever too busy about us, and to-day we lament the loss of some valued colleagues whose suggestions and counsel have helped us in the past. The late Mr. Penrose was associated with the early days of the Association under Edmund Sharpe. We also deplore the loss of Mr. Roger Smith, twice president of this Association, ever

and the friend and learned instructor of all young men under his helpful influence.

Coming to a conclusion, I have a few reflections which I offer to our student members. I might again advise the enthusiastic pursuit of the study and delineation of ancient architecture, or the fruitful results that await the diligent student of architectural literature, without enlarging on either, which I leave before. I would again heartily commend both to you, that I want to do is to venture to suggest the deliberate adoption of such studies as are the outcome of demonstration, experience, observation and research, rather than the study of books and the abstract theories of mankind. Sir John Lubbock, in his illuminating address before the British Association, made this pregnant statement, "From neglect of the study of architecture, and a small output of new inventions and new knowledge to reinvigorate our industries." There is some danger that in the prominence which is being given at the present time to the establishment of the day school and to our new premises, the valuable work which is being done in our studio and other evening schools may be lost sight of. I would wish to urge the study of young architects continuing their studies in their own homes, and to point out that there is no better means of learning and directing those studies than joining the various schools, which we open to them, and which have worked so well in the past.

This year I made more than a passing reference to the study of brains in the active evolution of architecture, and the younger members will pardon me if I beg them to do what I then said in connection with what I have to say now. Now it seems to me that much of the deplorable process which we unfortunately see abounding in the affairs of our cities and towns is the result of (to put it in words than mine) "old rule-of-thumb processes, which are opposed to new developments"—a conservatism too often arising from the master's own lack of knowledge. This may be hard saying, but it should be our object as much as lies in our circumscribed and limited powers to develop and to use the abilities with which we are all more or less endowed. We are to be young, and all possibilities lie with youth, in a way it may be said that to be young is to be successful.

To secure our well-being as a profession it is highly important that we see to our organisation and equipment, the conduct of which is to us personally as important as the conduct of "battleships and big battalions." It is brains that we want, fortified by the experience and research of the past, and it is the practical personal study of the design and execution of modern work by modern masters, reinforced by the rich heritage of art which has come down to us.

As has been recently said, "It is a great thing to learn to know from people's experience, and to get it first hand, not entirely to books. Knowledge obtained from men is mentally nourishing and the most easily assimilated." What I would leave with you is the picture sketched by Browning:—

Here, work enough to watch
The master's work, and catch
Hints of the proper craft, tricks of the tool's true play.

G. H. FELLOWES PRYNNE proposed a vote of thanks to the President for his address, which, he said, was characterised by the definite announcement of new premises for the Association. Every member would welcome the time which he brought them to the move, knowing the immense value of the new premises to their work. The announcement was one of the most important made in the history of the Association, and with the knowledge of the past and aware of the success gained in the present, they could go forward with hearts in the belief that the change of the museum in the Strand would not be lost either to the nation or the Association. The change meant that the work of the Association was progressing with true life and energy. The work, the staff and their excellent lecturers had inspired many of them, and they owed a great debt of gratitude to them. It was arranged that the number of subscriptions to the new premises fund was comparatively small, and members should be heartened by the fact that only one-fourth of their number had contributed to the appeal for funds.

J. S. GIBSON, who seconded the motion, said the work of the Association was of such importance that it might be said that it was the nation, and therefore members should do all they could to influence the Government to help them in their need.

His Excellency Viscount HAYASHI thanked the meeting for the reception given to him and his countryman. He referred to the erroneous statements made by tourists who had said that Japan as to the construction of Japanese dwellings. The active architect had great difficulties to encounter, as earthquakes were of frequent occurrence. There was, however, a desire to make their dwellings more stable, and Mr. Sudsuki was the pioneer of a movement which might establish an im-

provement in the native art of construction. The impression of travellers was wrong when they described Japanese houses as tent-like structures supported by poles and posts pasted over with paper to serve as walls. He had been asked if a Japanese house could stand a heavy shower of rain in summer or a snow storm in winter, and it was natural for such questions to be asked after the descriptions of their dwellings by tourists. Japanese houses were strongly built and statements of instability were not exactly true, and this was proved by the fact that there were many old buildings existing several storeys high. Many pagodas had lasted, in spite of earthquakes, 200 or 300 years, and the older capitals possessed buildings of such sound construction that they had stood their ground for 1,200 years.

Mr. ARNOLD MITCHELL, Mr. H. LOVEGROVE and Professor BERESFORD PITE supported the vote of thanks to the President, which was passed with acclamation.

PARIS HOUSES.

THE last number of the *Architectural Review* (Bates & Gould Company, Boston) is devoted to the subject of apartment houses in America and Paris. A large number of plans and illustrations are given. The article on "City Apartments in Paris" is by M. Jean Schopfer, from which we take the following extract:—

During the last decade, very great advances have been made in the city of Paris in the construction of apartment houses.

In the first place, the municipal regulations put a limit upon the height to which houses can be carried in Paris. Several important consequences result from this. One of them is that there is a certain outward uniformity about the houses, according to the wealthiness of the district in which they stand. The maximum height of the fronts on the widest thoroughfares is 20 metres, and the part of the roof above being set back according to a given formula, architects manage to quarter five average storeys, plus the ground floor, and sometimes a sixth storey, set back under the roof. In short, they can give their storeys a height varying, as regards the first storey, from 3m. to 3m. 80, and from 2m. 80 to 3m. 20 as regards the other storeys. In very luxurious buildings the architect only puts four storeys in the 20 metres allowed him. Thus French architects are confined to extremely close limits—even more so than their American brethren—and are prevented from indulging in any fanciful flights.

The same regulations fix a limit to projections on the public ways, and hence another difficulty. They also lay down rules as to the dimensions of the large and small courtyards and the prospect of the windows giving thereon, which varies from 4m. to 6m. 66 minimum. These regulations have been made in the interest of public health, and I, for my part, find them excellent, but they certainly limit the landlord's rights and hamper the architect—all, it is true, to the great advantage of the tenant.

The new regulations in regard to public health are still stricter than the old ones. They insist upon more air and light for both street and courtyard windows. These regulations only came into effect on January 1 last, so that the houses we are about to deal with were erected under the old ones.

In the matter of construction and of materials the progress made is substantial. In Paris houses have always been built of stone, and they have been built well. This is a matter of ancient tradition and trade practices which, thank goodness, are long-lived. In the case of houses constructed twenty years ago, only the luxurious ones were built with iron joists; the rest had all their joistwork in wood.

Wooden joists are, as I have myself observed, still held in favour in America. I have seen private houses in New York, on Riverside Drive and in the districts inhabited by the wealthy, which cost from 60,000 to 80,000 dollars, and the whole joistwork of which was in wood. The great danger involved in this system in case of fire has been sufficiently proved by innumerable examples. In Paris, on the other hand, apartment houses, even those of the most modest type, with rentals not exceeding 1,500 francs a year, have all their summers in iron. From top to bottom there is no wood in the house as far as the building itself is concerned. This is a considerable step in advance. Thanks to this system Paris is spared such terrible fires as those that take place in America, where houses are entirely consumed. In Paris one room in a flat is burned out, or at worst all the rooms of the flat where the fire occurs, but it is exceedingly rare for a whole house to become a prey to the flames.

As is well known, steel beams have the drawback of allowing sounds to be heard from one storey to another. Architects have tried different methods of remedying this trouble, such as spreading thick layers of tan between the ceiling and the flooring, or a bed of cork or mineral wool or some other bad

conductor of sound, but as a matter of fact the problem has not yet been solved. The noise has been lessened, but its transmission has not been altogether prevented. Moreover, there are serious objections to leaving vegetable substances in places where no air circulates, owing to the fact that they are liable to decay.

In a few modern houses the floors are separated by means of ciment armé (cement with bundles of iron wires embedded therein), which has come into current use in building. These experiments have been very satisfactory. The new material is strong enough to withstand the heaviest strain, and it is absolutely fireproof. Some apartment houses have even been built entirely of ciment armé.

Everybody is aware that all apartment houses in Paris have a janitor. In the evening the street door is shut, and it can only be opened by the janitor, who pulls a wire leading from his room to the latch. It is an excellent way of guarding the house.

In the case of most large houses the entrance is made wide enough for vehicles to pass, which enables the tenants to get in and out of their carriages under the archway and at the very foot of the stairs. This is a convenience with which few American houses, even amongst the most luxurious, are provided. The stables are generally situated in the courtyard, but not so in most of the newest houses. At present it is the custom, when space allows, to have two courtyards. One of them, with the windows of the dining-room, inner corridor and bedrooms looking thereon, is called the courtyard *de luxe*. It has a small lawn, a fountain, and, if possible, a few trees in it. No kitchen window is made to open upon this courtyard. In the second one there are the stables, and it is from this yard that the kitchens, servants' rooms, water-closets, &c., get their light. There is room for great improvement in this direction in the United States, where nothing could be uglier than the yards inside the blocks. There are houses which cost 100,000 francs, with a handsome front on a wide street, but whose courtyard front is dreadful to behold. Landlords ought to agree amongst themselves for the proper laying-out, at their joint expense, of the space left empty behind the houses.

As regards the interior, all new houses, even the most modest—I mean those with rentals not exceeding ten or twelve hundred francs—are provided with two staircases: one for the masters and the other for the servants. In high-class houses the principal staircase is very luxurious. It is built either in marble, stone or wood, and is provided with an abundance of light and air.

The elevators are of various systems as regards their motive power—water, water and electricity, or, in the most up-to-date houses, electricity and compressed air; but all of them are planned in a very practical manner, which is only just beginning to be known in America. I mean by this that the tenants themselves work them, and without any danger. Inside the elevator there are five or six buttons, each one bearing the number of a storey. One pushes the button corresponding to the floor one is going to, and another button to start the lift. On no floor can the elevator door be opened while the elevator is in motion, nor can any door be opened unless the elevator is at a standstill in front of it. Another button rings a bell in the janitor's lodge, to call him when the lift gets out of order. It is a good and safe system; in fact, there are never any accidents, and it abolishes the lift-boy, who, so far, is a necessity in American houses.

As regards the distribution of the rooms, the point aimed at is to separate the servants' part of the flat from the reception-rooms. Adjoining the kitchen there is now always a scullery, which was not the case formerly. Formerly also—I refer to houses erected twenty years ago—the bath-room was usually located near the kitchen, whereas nowadays it is always placed close to the principal bedroom. In many instances there are two water-closets for the use of the family, and always one for the servants.

Great progress has been achieved in Paris with regard to dressing-rooms. Almost every bedroom has a separate dressing-room provided with hot and cold water taps and a waste-pipe. The hot water is supplied from a small boiler placed in the cellar. In houses where the flats are rented at 4,000 or 5,000 francs and have four bedrooms, the hot-water costs the landlord 100 francs per flat per annum. In many cases the dressing-rooms contain cupboards for hanging up garments.

Modern apartment houses have a telephone. The wire is led into the janitor's room, whence connections lead to instruments placed on each storey. The janitor receives the calls and switches the line on to the proper apparatus. Each tenant pays 50 francs a year for this joint service. The reception-rooms consist as a rule of a spacious corridor, on which give two or three drawing-rooms and the dining-room, all having

wide four-leaved doors, which are often glazed with panes. On reception days these doors can be thrown open and in this manner the occupants have a fine set of rooms.

The internal decoration is now quieter and in better taste than it was a few years back. It is still done in some of the old style—Louis XIV., XV. or XVI.—but more discreetly and more gracefully. The ceilings are no longer invaded by elaborate mouldings.

In new houses the incoming tenant is allowed to choose the manner of decoration in which the flat shall be finished. A refinement in taste has come about, and this is shown by the abandonment of overloading. I am glad to say that the habit of painting and decorating ceilings after the Italian fashion has been abandoned.

Outwardly, the latter-day Parisian apartment house differs from that of twenty or even ten years ago by the large windows and the bays. This feature alone would suffice to characterize a modern house. The liberal dimensions of the windows in Paris are only rendered possible by the temperate climate, which enables one to enjoy, without extremes of either cold or heat. The large size of the windows allows light and air to reach every corner of the apartment.

WALKER ART GALLERY.

ARTISTS who have exhibited in Liverpool have been much struck by the remembrances of Mr. Dyall, the curator of the Walker Art Gallery. Owing to the belief that his strength was failing, to the duties, he has resigned. The announcement of Charles Dyall's resignation and approaching retirement from the curatorship of the Walker Art Gallery, says the *Chronicle*, will be sincerely regretted by the public. He has been intimately connected since its commencement with one of the most popular institutions of the city, and under his care it has grown from comparative beginnings into a position of unequalled importance in the provincial art world. His disappearance from his position (in which he has become one of the best-known and best-liked men in Liverpool) will be felt with a personal loss by very many.

Mr. Dyall entered the service of the Corporation in 1877, on the opening of the Walker Art Gallery. His record since that date has been one of continuing success and progress in the work which he had at heart. Twenty-two autumn exhibitions have been held, and to each of these a veteran curator can look back with satisfaction as a personal success. He has been fortunate in the several chairmanships of the gallery, and among those whom he has worked, and whose confidence he has won, are Mr. First, Alderman Edward Samuelson, the unflinching champion of the orthodox in art; then Alderman Philip H. R. First, the brilliant eclectic; and now Councillor John L. First, who worthily wears the mantle of his distinguished predecessor. Mr. Dyall is growing yearly in love and enthusiasm for his chosen work, and his civic work as well as in experience and expertism. It is not to be forgotten that to Mr. Dyall is due the admirable original system under which the complicated business of the autumn exhibitions is managed—a system that has since been widely copied.

In addition to the autumn exhibitions, there have been many others held in the Gallery—notably the Naval Exhibition of 1892, which was greatly successful. Memory records a splendid exhibition of old and recent masters, gathered together from local collections, and other pleasant spring exhibitions of which applied art, photography and the like had produced. Mr. Dyall is zealous in his work for all these transient events, and has been no less earnest in his care of the permanent collection, which during his tenure of office has produced a new collection into existence. Only those who know the Art Gallery can best have any idea how much loving thought its management has expended on the care and display of its treasures.

Although for the most part bound up in his official duties, Mr. Dyall has occasionally given evidence of possessing a versatility of talent which peculiarly fitted him for his responsible post. As a lecturer, chiefly on art topics, he is well known at the Picton Hall and elsewhere; his friends have seen some excellent landscape-paintings from his easel, and he has made occasional literary efforts in prose and verse bearing witness to his possession of a ready pen and a graceful, humorous fancy. A volume of poems published in 1877 had an excellent place in many Liverpool private libraries.

The feeling of regret at a severance of old ties is mitigated by the fact that although entitled by his years and long service to step aside from a life of full activity, Mr. Dyall enjoys that health of body and mind which will enable him to find much happiness in the evening of life—a happiness which is insured not only by the consciousness of a life well done, but by the possession of a life companion with whom a full share of the general esteem and affection in which his husband is held.

NOTE.—The author apparently is not fully informed as to the development by the Otis Elevator Co. of automatic elevator service in the United States.—[E.D.]

BUILDING LINES ON ROADS.

the subjects inquired into by the Departmental Committee on Highways was the line of frontage. Several of the witnesses gave evidence, the most answers were those of Mr. E. T. Gardom, clerk to the Devonshire County Council, who aided in drafting the Bill to Amend the Law for the Administration of Highways, and by Mr. Henry Hobhouse, M.P. The following is

now come to Clause 7—power for county councils to make improvements of main roads to be executed in certain cases that propose to give the county council power to urban district council, "You must widen the street through your town?"—No; it is to provide that, and fronting, adjoining or abutting on any main road any main road repairable by the county council is in being or is about to be developed for building purposes, application to such roads is required in order to make it or the probable increase of traffic, the county council is to level, pave, or metal, channel and make good it, and may apportion the expenses incurred by doing on the owners of the land fronting, adjoining or abutting on such addition or part thereof, according to the respective frontages, with power to recover expenses, primarily or by action in any court of competent jurisdiction."

At present the county council have no such power. It is considered that, as they are the road authority, they should have such a power in case of the desirability of widening the main road in consequence of building, and adjoining owners should be compelled to give up the land and for the purpose, and should pay the cost of the frontage in the same way as frontagers can be compelled to pay by an urban district council under Section 6 of the Public Health Act or Section 6 of the Streets Works Act, 1892, with regard to strips given in main roads in urban districts which become new streets in consequence of building. This is in accordance with the law in the case of the Property Exchange Company v. The North District Board of Works, 1901 (65 J.P. 407), upheld on appeal March 29, 1902 (L.J. 176). In the highway repairable by the inhabitants at large was the adjoining owner adding a strip of land to it on which houses were built on land abutting thereon. It was held that the strip of land so added, together with the land abutting on it, formed a new street, and the expenses of the new street were rightly apportioned by the local authority on the owners on that side of the road. This case approved the decision in *Richards v. Kessick* (57 L.J.M.C. 48), in which the owners of a field adjoining a highway repairable by the inhabitants at large used it for building land, and threw a strip of highway a strip of land in front of the houses, and so that the houses with the strip of land in front of them formed a "street" within the meaning of Section 150 of the Public Health Act, 1875, which the urban sanitary authority of the district it was situated could compel the frontagers to level, pave, channel and kerb to their satisfaction. Rural district councils which have obtained urban powers have also the right, but county councils have not, so that county councils have to rely on the action of district councils, and have to compel the latter to exercise the right. This is not so.

In other words, you propose to take certain powers out of the hands of the district councils and give them to the county council. As regards land abutting on the main roads.

It is not the person who has a frontage on the road who is developing the property for building purposes, and yet he is to make him pay towards the cost of a widening of the road which is of no benefit to him?—It is the same in laying out a new street. This Bill proposes to give the county council the same power as urban district councils now have in urban districts, and can exercise upon owners of buildings abutting on the main road. We want the same powers for the county council outside the urban districts. There are certain powers in the neighbourhood of towns, but in rural districts the main roads repairable by the county council, where the county council has no power to make by-laws, and in the rural district council has no such power.

There is already a main road repairable by the county council, and this is apparently a proposal to throw the repair of the road in respect of through traffic upon the person who is adjoining it?—Not the repair of the road, but the

of it. A man build up to the side of a road, you could not repair it, but if he sets back a bit you could make the front portion into the road at his own expense?—The county council should make by-laws defining the width of the street, and a man who is building should be compelled to set back in order to extend the road to the width defined by the by-law.

It would make him give up some of his land to the public,

and by another clause you would make him put it into the road?—Yes.

He gets an improved frontage to a better road.

Many authorities now define the width of a street before there are any buildings upon it.

But I can conceive the case of a frontager, if he is a private resident, not wanting a wider road or more traffic brought past his house?—It is only when the road becomes a street that this would apply. I do not think that Clauses 7 to 10 of the Bill go quite far enough, as since the decision in the case of the Devonport Corporation v. Tozer (1902), approved on appeal (1903), it appears to be necessary to compel an owner who is developing a building estate abutting on a main road to give up such land as is required to make the road adequate for the consequent probable increase of traffic. In the Devonport case an owner of a piece of land abutting upon a main road erected several houses upon the land without altering or interfering with the roadway or removing the fences, but making necessary openings for entrance and exit. Under the by-laws of the Corporation, any person laying out a new street was required to make it of a specified width of 36 feet. The highway in question was less than this width—24 feet, and in one case less. It was held, however, that the defendants were not, in fact, in what they were doing, laying out the highway as a new street. In all these cases it is a question of degree as to how far an adjoining owner is in what he is doing by building or otherwise laying out or intending to lay out a new street, and what appears to have weighed with the Court of Appeal was that in the Devonport case the owner had not removed the fence, but only made openings through for access to the houses, and had not attempted to alter or interfere with the roadway. The decision seems to lead to a remarkable result that the owner may build a row of houses behind a hedge, and if he does not pull it down he has not infringed the by-laws, whereas if he does pull down the hedge and erect a row of houses he is so infringing. The question in this case appears to be whether the owner of the land shall give up the necessary land for the widening of the street without payment, or whether the road authority shall pay for it either by agreement or after compulsory purchase. To quote Mr. Macmorran's words in his argument in the Devonport appeal:—"The question in all these cases is whether a corporation cannot compel persons to make the road of a necessary width. If they cannot do that then there is no doubt that the builder is entitled to build to the very edge of the road, and then if it is ever necessary to widen the road for a necessary purpose you have the fact that you have buildings to deal with, and what is an enormous and costly thing is thrown upon local authorities without any necessity at all. Why should they be called upon to widen a road like this? It is quite sufficient as it is now for all purposes of traffic, and when it comes to be converted into a new street the traffic is altered. You have not only the traffic, but all the services to the houses, bringing up the pipes and everything else. All these things have to be considered, and the local authority have a duty to perform towards the public. If a man is doing for his own purposes something which amounts to the laying out of a street for his own purposes, and the public do not want it, why should they have to pay if there is an obligation upon him, as we contend there is, to do it?" And again, Mr. Macmorran says:—"Take the case of a man having an estate; he cannot make a new road there without conforming to the by-laws, and in that case he is bound to make it 36 feet wide, or whatever the prescribed width may be. There is no hardship there really. He has to set back his building there, just as if he is using the old highway as part of the new street which has to be formed. There is no hardship in that at all. Just as in the one case he has to find the whole of the width out of his own land, so if he finds an old way which he can utilise he has to find the difference sufficient to make it the necessary width. It is true that the rateable value of the district is enhanced by the building; on the other hand, the road was of sufficient width for the traffic before the erection of the houses, and the obligation to increase the width should be borne by the owner. Of course, the road authority would take over the road and its future maintenance." Referring to the Devonport case, I may say that I have ascertained that the town clerk considers it a most detrimental decision for local authorities, and as an illustration of the inconvenience and even possible danger to the public resulting from the decision, he mentions that poles for an overhead equipment of electric tramways are being constructed along the road in question. The footpath in front of the houses, which was the subject of the action, is so narrow that when the space taken by the base of the electric poles is deducted there will only be a width of 2½ feet for pedestrians.

This clause would not cure the difficulty under the Public Health Act or the Private Streets Works Act, but would only cover the case of main roads not in urban districts?—Quite so.

It seems to me that Mr. Gardom has in his mind the case of a man turning what was a country road into a street by

building houses up to the edge of the road. If you have a by-law you can make him set back a certain distance from the centre, so that when it becomes a street there is sufficient for a footpath.

Everything would turn on what the man built. Suppose he built a lodge at his park gates?—That would not be a street.

It would be laying out the site for building?—Where a man proposes to build a street, and so develop his land for building purposes, we think he ought to pay for widening the road for that purpose.

I think the committee understand. We may now go on to the next clause, namely, the power of county councils to make by-laws as to new buildings on and width of main roads. That only refers, I suppose, to roads outside urban districts, or do you propose that the county council should make by-laws as to the width of road in urban districts as well as those outside?—Only with reference to roads repairable by the county council.

Section B seems to provide what I think a good power, namely, that the county council may make by-laws with respect to the level and width of any such main roads wherever land fronting, adjoining or abutting thereon is in process of being or is about to be developed for building purposes.

I was afraid that there was a suggestion of a dual authority inside the urban districts. I do not propose that here. If we did take over the main road in any urban district the by-laws would have to be approved by both parties, and they would have to be subject to the approval of the Local Government Board.

I am satisfied so long as it is perfectly understood that this does not affect urban district authorities exercising their own powers in their own districts?—All we ask for is a power to make by-laws relating to roads. We do not want to interfere with sanitary or public health matters.

Do you want to have power to compel the district councils to widen their own roads?—No, I am referring to main roads.

You know the word "building" is a highly technical one, and in some cases has been held to include the throwing down of a division between two cottages—the lateral division—or putting a storey upon one of them?—I think it would not matter much what the building was if it encroached upon the fixed building line.

Would it not be undesirable in a Bill of this kind to alter definitions already existing?—Quite so.

You surely would not propose that a house standing, say, 30 feet—or whatever the prescribed distance may be—from the centre of the road, should have to be pulled down and set back if it required to have a new storey put upon it, although it might then be a "new building" in a technical sense; or take the case of two cottages thrown into one. The throwing them into one is considered as technically the erection of a new building; would the proprietor in such a case have to set back?—All I want is that we should have the same powers in this matter as urban district councils now have. If they have not the power that you describe, I do not ask for it. I think this clause follows the wording of the Public Health Act.

The Public Health Act has caused much trouble with regard to what is a new building?—Our idea was not to interfere more than possible with the language previously used.

I think that phrase has been almost a more fruitful source of legislation than any other expression.

You propose to compensate any person who is damaged?—That is not in accordance with my own individual view, but it was put in at the suggestion of some of the members of the county council. I do not see why a person should be compensated outside the urban districts who would not be compensated inside such districts. I understand that in Liverpool compensation is paid.

So it is everywhere.

Where you pull down houses for the purpose of widening you pay compensation; but if a new street is being laid out under these by-laws the owner would have to give the land himself.

It is only in cases where the street is being laid out at a greater width than is required under the by-laws that compensation is paid.

I think the Public Health Act contemplated the payment of compensation for all land taken away from anybody.

I see that Clause 9 proposes to give further power to the county council to regulate the line of buildings in main roads. What further power besides the by-laws would you suggest?—The powers under the Public Health Act are insufficient, as they are limited to the line fixed by the front main wall of the building on either side of the proposed building in the same street, and it is essential that in some parts of the county the line should be fixed of the first house erected which abuts on the main road; the clause should be extended to cover this. This is an omission in the Public Health Act.

It does not cover such a case at present?—No, I think not. The clause is supposed to give us the same powers outside the urban districts as the urban district authorities now have

within those districts as regards regulating building.

The proviso certainly seems to contemplate a district council, viz. provided that the county council shall not exercise power hereby conferred in any case where the district council have already put in force their power under the mentioned section in respect of such houses and land. Does not that proviso contemplate the power being exercised in the district of any urban district council?—The proviso refers to roads in rural districts where the council have obtained urban powers. Rural district councils in urban districts have no bye-laws, or, at any rate, have not exercised them. There are in many instances buildings placed near to the frontage and at awkward corners to the street which ought not to have been allowed, and would not have been allowed by the county council if that proviso had been the necessary power.

In my opinion the proviso restricting the powers of the county council to cases where the district council have powers in force should be omitted, first, because the county council as a road authority is the proper authority to fix the line of building, and the district council should not do so; and, secondly, because, as before pointed out, the powers of the district council do not extend to the line of the first house built. I consider that the county council, as a road authority, should deal with all these matters—road, line of building, &c., which affect the highway. The district councils, where not the road authority, should be restricted to matters which affect sanitation and public health.

As you have just pointed out, under the extension of the powers which you propose a house may not be brought forward to the front of the line of the house on each side of it. In a country road—a main road—there may not be a distance of a mile or a mile and a half. Do you think no man may build a new house or put forward his house throwing out a bow window in front of the line of a farmhouse two miles off on the same road?—No, so far as that.

Yet you would have that power under that clause?—I do not think the section goes so far as that.

I think the witness wants to enable the county council to prescribe a line of frontage for new houses where there is development on each side of the proposed house.

I think this committee well might recommend that the county council should be some power to fix a line of frontage, together with a statutory provision that a new house should vary from the line of a house which may be two miles off on a country road.

It would seem unreasonable if one man built a house more back from the roadway, and that was made everybody else doing the same.

But probably you do not wish to urge anything more than that the highway authorities in a main road should have some power to fix a building line?—I think that is the point.

Does not the witness advocate the granting of powers to county councils in respect to their roads to be enjoyed by urban authorities with regard to urban districts?—I should like to go a step further than this clause in the Bill and to propose that we should be able to fix the line of the first house.

What is the first house in a road 20 miles long?—I do not have to say what section of the road you refer to. I should leave that to the county council, so that if they thought there was a chance of a road having to be closed they could fix a line to enable that widening to be carried out.

There are considerable lengths of road—of miles—where there is not a house within a distance of a mile, but what you call the first house is already there.

Probably the witness means the first house built under the passing of the Act.

The first house in the development of the building estate.

Where there is a definite scheme of building more than one house.

Possibly a rigid regulation would be impossible, and the deal might have to be left to the discretion of the county council.

To whose discretion would you leave it?—To the county council.

You would not recommend the rigid provision in the Public Health Act?—I would so far as existing buildings are concerned, but in the development of a new building I should like the county council to be able to fix the frontage of the first house.

Do not the by-laws of local authorities provide that a road must be so many yards wide; would not such a provision point as to the frontage line of the first house?—Not.

On a subsequent day Mr. Gardom again appeared.

hing further on the subject of the roadway, making
ing to the width of the road and relating to build-
Yes, there has been some question as to there not
ontrol. I do not intend to say that there should
ontrol, but what I would suggest is that the road
ould have the power to make the by-laws with
ghway matters, and that the district council should
-laws as regards sanitary matters.
ou would have a dual control to some extent. Do
ish to press upon this committee that inside an
t which has claimed to maintain its main roads
ouncil shall have a right to make by-laws?—No,
ng to roads as under the clauses of Mr. Hobhouse's
which are repairable by the county council. I
de urban main roads repairable by an urban

ould leave the width of the road and the line of
outing thereon to the county council as the road
Yes.

o sanitary matters, you think the district council
e authority?—Yes.

gest that a building line is a matter of highway and
n?—That is my point.

as it does not come within the minimum width,
not allow them to overstep that minimum width.
—There is no statutory minimum width, and I
the width should be in the discretion of the road
I do not believe that a statutory minimum width
tisfactory.

l be a widening and not a narrowing?—I do not
ow the width, but there is an erroneous impression
a statutory minimum width, and I contend that
such thing. All that there is in the Highway Acts
y remedy in the case of encroachments within a
ance of the centre of the road. But that must be
way itself or on the sides of the highway, and not
land. It is only a summary remedy, and that
ly useless, because it is only available for six

upport the contention that the local authority should
power to go within any minimum width fixed by the
ity?—Certainly not. My argument is in favour of
ot minimising.

ou wish to add something to clause 9 of Mr.
Bill, which is now before us?—That is the same
by-laws being made by the road authority. I do
at the proviso to that clause ought to apply to a
t.

ther have you to say as to the width of roads?—It
regard to what the last witness stated. I want to
point that there is no minimum width. There is a
s to the planting of trees within a certain distance,
s Section 64 of the Highway Act of 1835, and there
on in the Turnpike Act of 1824, to which reference
y the last witness, and I do not know that I need go
t. There again no minimum width is fixed, but simply
hall be no encroachment on lands which form part
way except as to common waste land. It includes
waste land which is not included in the Act of
there is really no minimum width.

wish to add anything on the subject of compensa-
lening roads?—I want to make that quite clear. I
ree with compensation being paid except where
s required beyond the limit fixed by the by-laws. If
ouse to be pulled down for the purpose of widening
compensation should be given, but if land is re-
the making of a new street then there should be no
on paid. There is no compensation paid now in the
urban district, and I suggest that outside the urban
e same principle should apply.

ave you any further reference to make to the Devon-
oration *v.* Tozer case?—In that case I said the
ight possibly be overcome by a new by-law, and
ated by counsel during the argument; but since then
orran's opinion has been taken, and he considers
law that could be devised would apply to the road in
eeling that it is held that it has not become, and is
ing, a new street; and also that the only alternative
isolation, and unless this is done it will be impossible
o interfere with any building in any road, however
t may be—except at a very heavy cost to the muni-
hat is to say that they must pay compensation; and
e main objects of the Public Health Act will be

ou give us any practical suggestion as to how a case
rt is to be met?—It ought to be considered that if a
s within a certain distance of the centre of the street,
ad has become a new street, he ought to give up the
e made to make the road up as in the ordinary way
iger.

is to say it ought to be laid down by law that an old

road may become a new street by the fact of building, and
that if any building is put up, whether within or without the
fence, within the limits of a by-law, it should be an illegal
building?—I would not say an illegal building.

Your proposition is that it may be a street, which is very
obscure, but an old road may become a street, and then if
buildings are put up within a less distance of the centre of the
road than is permitted by the by-law, whether on private ground
or behind a fence or not, would you say they are being put up
illegally?—Yes, contrary to the by-laws.

HOUSING REFORM IN GERMANY.

A CORRESPONDENT of the *Times* writes:—The pressure
of the housing difficulty has been felt and the necessity
of dealing with it widely realised for a good many years. The
problem has been attacked in many ways and by various
agencies—by the State and the local community, by building
societies, building companies, philanthropists and manu-
facturers—and in the aggregate much has been done. The
Germans are not the people to sit down before a difficulty and
wring their hands or call for help; they tackle it individually
and collectively. The subject is very large, and I must confine
myself to Prussia, and particularly to the Rhineland and West-
phalia, where the need and the activity have both been
greatest.

1. The State has provided housing for its own servants, and
principally for the subordinate classes of railway men. In
October 1901 there were built or building in the two provinces
473 houses, containing 2,231 dwellings and 7,009 rooms, at a
cost of 451,160*l.*, including sites. The interest on the total
outlay comes out at 3.65 per cent. These houses are prin-
cipally situated in the railway districts of Essen and Elberfeld,
where the need is greatest. Further, in the Saarbrück coal
mines, which belong to the Prussian Government, a system of
helping the men employed, who numbered over 40,000 in 1900,
to build their own houses by means of gifts and loans has been
developed on a large scale. The gifts are to the value of from
37*l.* to 45*l.*; the loans are free of interest up to 75*l.*, and at
3½ and 4 per cent. beyond that. The conditions are that the
recipient shall be married and the owner of a building plot free
of debt. The houses so built are, as a rule, single cottages for
one family. The loans are repayable in ten years. Down to
1901 the amount provided in gifts and loans amounted to
767,725*l.* In addition the administration itself erected houses
for 441 families.

2. Local Communities.—Some municipalities provide houses
for their own servants and for needy families; but a number of
local authorities have gone beyond this and have built houses
for the lower classes at large. This has been done in fifteen
Rhine districts and five Westphalian. The earliest was the
Merzig district, which was stimulated to the step by a housing
investigation in 1894. Among the most active is Düsseldorf,
which had in 1901 built dwellings for 141 families; eighty of
the tenants were in the service of the municipality. The 141
dwellings were thus classified—43 of two rooms, 85 of three
rooms, 13 of four rooms. Local authorities have further pro-
moted building by lending money from the public savings
banks at low interest, and by co-operating with building
societies in various ways. They provide cheap building sites,
take over shares, guarantee interest on loans, facilitate the
laying-out of streets, and reduce the ground and building
rates.

3. Charitable Endowments.—These are rather scanty. The
most considerable is the Aders fund at Düsseldorf. The
testator, a judge, left about 100,000*l.*, of which half was to be
applied to educational purposes and half to the provision of
dwellings at moderate rentals for factory workers, or others of
the same class who were not in receipt of Poor Law relief. The
town took over the fund in 1890, and in 1902 had provided out
of it dwellings for 257 families, while the fund itself had risen
to the value of 82,100*l.* As it increases, in the course of time
it will play a correspondingly important part in the matter of
housing. Other endowments in the district are the Krupp
fund of 25,000*l.* at Essen, the Guillaume fund at Cologne, the
Hösch fund at Düren, and the Simonson fund at Godesberg.
The aggregate number of dwellings provided from these endow-
ments in 1902 was 364 at a cost of 107,300*l.* They are only
for rent, not for sale.

4. Building Societies.—These are numerous and active.
They claim the character of public utility and the merit of
providing unexceptionable housing at the lowest cost for
persons of small means, and thereby raising the standard of
life. Details from 109 societies in the Rhine province were
furnished to the Düsseldorf Exhibition in 1902. The 109 con-
sisted of 20 share companies, four limited liability companies,
83 registered societies and two others. To these may be added

37 unions in Westphalia, which also furnished details. Putting them together we get the following:—

Houses.	Dwellings.	Rooms.	One-family houses.	Two-family houses.	Three-family houses.	Four or more family houses.
3,877	9,714	32,467	748	2,155	377	567

Three-fourths of the houses, therefore, only contain one or two families. They are, in point of fact, semi-detached, and with gardens in the majority of cases, and are obviously a great improvement on the tenements of the speculative builder. The total expenditure on sites and building was 1,657,602*l.* Of the houses 2,631 were sold and 1,216 were let; the amount paid off on those sold was 231,863*l.*

5. Employers.—I have referred in several previous articles to houses built by manufacturers. Employers have indeed done more for housing than all the other agencies put together. In 1902 the two provinces could show the following remarkable record pretty evenly divided between them:—

Houses.	Dwellings.	Total Expenditure.	Loans and Gifts for Building.
22,269	62,539	10,466,960	268,896

Of the total number of families so housed more than half belonged to the mining industry. Their distribution, according to the census classification, was as follows:—

Mining, 32,396; iron, 16,471; textiles, 6,659; quarrying, 3,987; various, 3,026. Naturally the housing provided for the mining population is chiefly situated in Westphalia, where about 19,000 dwellings have been built; and the same industry accounts for 110,000*l.* of the loans granted for building. The other industries preponderate in the Rhine province.

It is hardly necessary to add that savings banks, whether public or private, play an all-important part in the building and acquisition of workmen's dwellings.

GENERAL.

Dr. Friedrich Lippmann, the director of the section of engraving in the Berlin Museum for twenty-seven years, died in that city on Friday last in his sixty-third year. He was a native of Prague and always retained the Bohemian dialect in conversation. He was recognised as the principal authority on the work of Albert Dürer.

The Faviours' Company have made awards in their recent competition by essays, drawings and models on "Subways or other means of placing and maintaining without interference with the surface the main pipes and services of gas, water and other undertakings below the carriageways or footways of cities, boroughs and towns." Twenty-six competitors took part. The awards were made as follows:—First premium, 105*l.*, to Mr. R. M. Parkinson, 93 Lincoln Road, Peterborough; second premium, 31*l.* 10*s.*, competitor's name at present unascertained; third premium, 21*l.*, Mr. F. M. Royle, A.M.Inst.C.E., Third Avenue, Sherwood Rise, Nottingham. The drawings will shortly be on exhibition at the Guildhall.

The Foundation-stone of St. Aidan's, Crews Hole, Bristol, has been laid. The chancel, two bays of the nave, with the south aisle and morning chapel and vestries will be proceeded with at once, and contracts for this work amounting to 4,873*l.* have been signed. The necessary furniture, fittings and contingencies will increase this amount to 5,200*l.* The church when completed will accommodate 755, and will cost an additional 2,400*l.* The plans were prepared by Mr. G. F. Bodley, R.A.

The Metropolitan Asylums Board last week approved of the reconstruction of the South-Eastern Hospital buildings at the estimated cost of 123,000*l.* The scheme provides that the 288 beds in the temporary buildings shall be replaced by 385 in new permanent buildings, bringing the total accommodation for patients up to 488 beds, and it includes the extension and remodelling of the administrative block and the provision of additional accommodation for nurses, female servants and the male staff.

The Foundation-stone of the City of London Crematorium will be laid at Ilford on Wednesday, the 14th inst., by Mr. R. W. Edwards, the chairman of the sanitary committee, a body which acts as the burial board for the City. The crematorium will cost, when completed, 7,000*l.*

The Governors of the Durham University College of Science have received the desired sum of 50,000*l.* to complete the college buildings as a memorial to the late Lord Armstrong, which enables the Council to carry out the whole of the additional buildings with the exception of the important central tower, which would cost 5,000*l.*

A Tomb in St. Bartholomew's Church, Cadelei, has just been restored, which is a very fine specimen of Jacobean sculpture. Under a richly-wrought canopy recumbent effigies of Sir Symon and Lady Leach, and kneeling figures of their nine children. The inscription as follows:—"Here lye the bodies of S. Symon Leach son of Symon Leach, of Crediton, and of Lady Katharine his wife, daughter of Nicholas Turberville, of Crediton, whose true affection in religious wedlock caused them to make their bed together in the dust."

The Members of the Académie des Beaux-Arts have investigated the claims of applicants for the post of secretary are M. Gerôme for painting, M. Frémiet for sculpture, M. Daumet for architecture, M. Chaplain for engineering, and M. Saint-Saëns for music.

The Westminster City Council have recently passed a resolution to aid them in procuring an amendment of the Public Health (London) Act, 1875, more effectually check smoke nuisances in the Metropolitan area, unless black smoke is emitted no offence is taken. The Council suggest that the word "black" should be deleted from the Act. As this (the medical officer states) would effect, cause smoke of any colour emitted from a chimney being the chimney of a private dwelling-house) in a city as to be a nuisance to constitute such an infraction could be dealt with summarily, the Corporation have decided in that view.

The Local Government Board have authorised the erection of additional buildings at Joyce Green hospital, the cost not exceeding 8,680*l.*, and the erection of cottages at Brook and Grove hospitals respectively for the accommodation of the resident engineer at a cost of 1,070*l.*

The London Corporation decided last week to select competitive designs for the new Southwark Bridge, on instructions that the designs shall be as artistic as possible.

The New Church of the Ascension at the Docks, London, was opened last week. It has been planned by Messrs. J. E. K. & J. K. Cutts, and will accommodate 1,000 people. Owing to the treacherous nature of the site the building has cost over 5,200*l.*

The City Engineer of Glasgow stated at the last meeting of the Corporation that the steps which were being taken to restore the decayed stone on the façades of the Town Hall Buildings and prevent further damage from weathering was the result of the advice of an expert, and it was expected that the work would be efficient.

A Divisional Volume, the sixth, of "The Manual of the Carpenter, Joiner and Cabinet-Maker," prepared under the supervision of Mr. Lister Sutcliffe, has been issued by the Publishing Company. It treats of carpentry, joinery, structures and bridges by the Editor, wood-carving, and the commencement of an article on stairs and hand-rails.

The Marylebone Borough Council having obtained the sanction of the Local Government Board for 17,274,000*l.* for the purchase of the Marylebone property, the Marylebone Electric Supply Company, will promote the ensuing session of Parliament to obtain the necessary borrowing powers, and other powers which it would be requisite to acquire for the effective working of the undertaking under municipal ownership and management.

The Isle of Wight County Council have agreed to a Bill of Trade to make an order under section 4 of the Harbours Act, 1814, to prohibit the removal from the island of sand and shingle, the accumulation of which is regarded as the most effectual protection against the wash of the sea. The application is being strongly supported principally by the owners of manorial rights and estates, and is based on the building trade, in which large quantities of material have been used, notably in the construction of fortifications and other military works.

Mr. H. W. Brewer, who was most successful in his career as an architect, died on Tuesday, the 26th inst., in his sixty-seventh year.

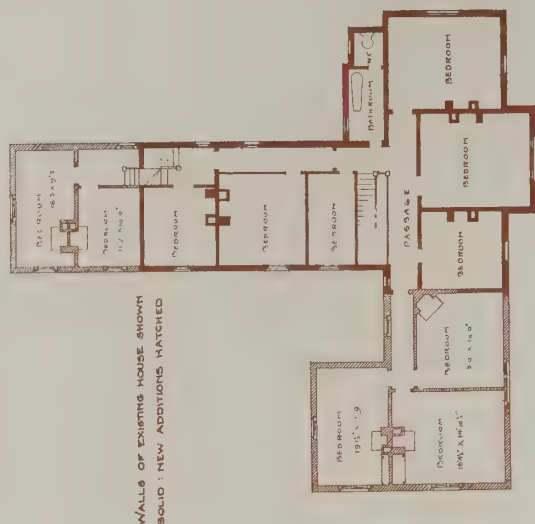

Mr. J. S. Rubinstein will read a paper on "The Law of Officialdom" at the Law Society's Congress, which will be held on November 10, 1903, with reference to the working of the new experimental compulsory registration of title under the Land Transfer Act, 1897.

The Governors of King's College Hospital are seeking a site for the hospital in South London. There is a large area extending from Wandsworth, through Brixton, Stockwell, Camberwell and Peckham to which particularly needs the advantages implied in a general hospital. A sum of 300,000*l.* is required.

The First Ordinary General Meeting of the Institution (session 1903-04) will be held on November 9, when the president, Mr. Albert Smith, will deliver an opening address. The chair will be taken at 8 o'clock.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BRIGHTON.—Nov. 9.—Designs are invited for a new hospital. Premiums of 50*l*, 30*l*, and 20*l* will be paid to the first, second and third premiated designs respectively. Parcels up to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Brighton and Hove Hospital for Women, 76 West Street, Brighton.

OLDHAM.—Competitive plans are invited by the Oldham School Board for a school for older children and infants. Mr. Annie, clerk, School Board Offices, Oldham.

LAWTENSTALL.—Oct. 12.—Competitive designs are invited for a free library, town hall and assembly-room buildings. Premiums of 100*l*, 50*l*, and 30*l* respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Lawtenstall.

SHEPTON MALLET.—Oct. 15.—For the erection of a hall used as drill hall and for musical purposes, cost not to exceed £1,200. Plan of site and copy of conditions on payment of £1 1*s*, which will be returned, from Mr. H. Charles, 12 Commercial Road, Shepton Mallet.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100*l*, 50*l*, and 25*l* will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20*l*, 10*l*, and 5*l* will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

CONTRACTS OPEN.

ACTON.—Oct. 20.—For the erection of an engine-shed, &c., at Old Oak Common, Acton, Middlesex, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

ASHINGTON.—Oct. 21.—For additions to the bakery department, Ashington (Northumberland) Industrial Co-operative Society, Ltd. Mr. John Magin, secretary.

BARROW-IN-FURNESS.—Oct. 17.—For the erection of a store shed at Cambridge Street school. Mr. C. F. Preston, town clerk, at the Town Hall.

BARROW-IN-FURNESS.—Oct. 17.—For the removal of the iron school in Back Latona Street, Vickerstown, and the erection of the same on site in Ocean Road. Chairman of the Sites and Buildings Committee, Education Committee, Town Hall.

BATLEY.—Oct. 17.—For the erection of boundary walls at the sewage outfall works, Bradford Road. Particulars may be obtained at the office of the Borough Surveyor, Branch Road, Batley, Yorks.

BECKENHAM.—Oct. 12.—For the taking-down and re-erecting in new position the cart, &c., sheds in the Council's depôt, Bromley Road, the erection of boundary walls and sundry other works in connection with the alterations to the sheds. Mr. John A. Angell, surveyor, Town Hall.

BEDFORD.—Oct. 12.—For the carrying-out and construction of certain works in connection with the existing waterworks of the borough, consisting of new filter beds, alterations to the existing filters and reservoirs, the driving of a heading, waste prevention works, &c. Mr. Hedley Baxter, town clerk, Town Hall, Bedford.

BEDLINGTON.—Oct. 17.—For the erection of a corrugated iron fever hospital at Bedlington, Northumberland, to accommodate twenty patients, administrative department and usual out-buildings. Mr. C. Brown, surveyor, Bedlington.

BLACKHEATH.—Oct. 15.—For the erection of depôt buildings on site at St. John's Park. Mr. Francis Robinson, town clerk, Town Hall, Greenwich Road, S.E.

BRADFORD.—For the erection of a house, offices, stabling and boundary walls at Canal Road, Bradford. Specifications to be seen at the Aird and Calder Navigation Offices, Dock Street, Leeds.

BRISTOL.—Oct. 22.—For the erection of a school at Air Balloon Hill, St. George. Messrs. La Trobe & Weston, architects, 20 Clare Street, Bristol.

BURY (LANCS).—Oct. 27.—For the taking-down and re-erection of shop and premises, 10 Water Street, Bury. Mr. John Haslam, town clerk, Municipal Offices, Bank Street, Bury.

CAIRO.—Feb. 1, 1904.—For the construction of three bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

DEWSBURY.—Oct. 17.—For the erection of a warehouse in Bradford and Wood Streets, Dewsbury. Messrs. Holtom & Fox, architects, Corporation Street, Dewsbury.

DURHAM.—Oct. 12.—For the erection of dwelling house, Hugar Road, High Spen. Mr. Thomas H. Murray, architect, Consett.

EASTBOURNE.—Oct. 13.—For additions to the reconstructed refuse destructor at Roselands. Mr. Daniel J. Bowe, borough surveyor, Town Hall, Eastbourne.

EMBLETON.—Oct. 17.—For erection of farm buildings at Low Netherscales, Embleton, Cumberland. Mr. Edmund Jackson, civil engineer, Whitehaven.

GATESHEAD.—For alterations and additions to premises in West Street, Gateshead. Mr. W. R. Story, architect, 2 St. Nicholas Buildings, Newcastle-on-Tyne.

HARROGATE.—For alterations and additions to the Claremont hotel, Harrogate. Messrs. Butler, Wilson & Oglesby, architects, 12 East Parade, Leeds.

HARROGATE.—For alterations and additions to the New inn, Skipton Road, Harrogate. Messrs. H. E. & A. Bown, architects, James Street, Harrogate.

HASTINGS.—Oct. 13.—For joinerywork at the engine-house, Brede, near Hastings. Mr. P. H. Palmer, engineer, Town Hall, Hastings.

HEREFORD.—Oct. 16.—For extension of the post-office at Hereford for the Commissioners of H.M. Works and Public Buildings. Particulars can be had on application to the Postmaster at Hereford, or at H.M. Office of Works, &c., Storey's Gate, S.W.

HORNSEY.—Oct. 13.—For street works in Birkbeck Road and Clovelly Road (2nd section). Mr. F. D. Askey, clerk to the U.D. Council, 99 Southwood Lane, Highgate, N.

HULL.—Oct. 16.—For the erection of thirty-two artisans' dwellings in Steynburg Street. Mr. Joseph H. Hirst, city architect, Town Hall, Hull.

ILFORD.—Oct. 26.—For the erection of dépôt building stables, &c., in Ley Street. Mr. H. Shaw, surveyor, Hall, Ilford.

IPSWICH.—Oct. 29.—For the erection of a public convenience at Alexandra Park. Mr. E. Buckham, borough surveyor, Town Hall, Ipswich.

IRELAND.—Oct. 12.—For the erection of a soldiers' mess at the Fair Green, Mullingar, co. Westmeath. Mr. A. E. Joyce, architect, Mullingar.

IRELAND.—Oct. 13.—For constructing and laying fireproof floors at the new male block (in course of erection) at the asylum, Letterkenny, co. Donegal. Mr. J. P. McGrath, architect, Commercial Buildings, Foyle Street, Londonderry.

IRELAND.—Oct. 16.—For the erection of a canteen building at the Ordnance Survey Offices, Phoenix Park, Dublin. Particulars and specification can be seen at the Office of Public Works, Dublin.

IRELAND.—Oct. 19.—For the erection of a new station building at Malahide, a stationmaster's house (two-storey) at Goraghwood, a stationmaster's house (one-storey) at Hambleton, for the Great Northern Railway Company, Ireland. Mr. W. H. Mills, Amiens Street Terminus, Dublin.

JOHANNESBURG.—Oct. 19.—For the supply alternatively of gas generating plant or steam generating plant, and of electric motors or steam motors, with electric generators and accessories, to the following specifications:—Specification No. 2.—Section A: Gas producer plant, capable of gasifying 7½ tons of Transvaal coal per hour, with coal conveyer, engine and cooling plant and all accessories; sections B and C: Four gas-engines, each for driving a 1,350 kw. dynamo (2,000 B. h. p.); one gas-engine for driving a 675 kw. dynamo (1,000 B. h. p.); three gas-engines, each for driving a 675 kw. two-phase alternator (1,000 B. h. p.); two motor generators, each consisting of a 250 kw. two-phase alternator and a 150 kw. dynamo; two balancers, each consisting of two 150 kw. dynamos. Specifications, forms of tender, and a plan of the site may be seen on and after September 7, at the offices of the Town Clerk, Johannesburg, or at the offices of the Council's consulting engineers, Messrs. Mordey & Davidson, 82 Victoria Street, Westminster, S.W.

KNARESBOROUGH.—For the erection of two semi-detached houses on the Avenue estate, Knareborough. Mr. V. Driffield, architect, Boroughbridge Road, Knareborough.

SCHOOL OF ART WOOD-CARVING.

THE School of Art Wood-carving, South Kensington, which now occupies rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition Road, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the Technical Education Board of the London County Council are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

WE understand that the citizens of Ballarat, Australia, have decided to erect a statue to the memory of the troops who fought in the South African war. The statue is to be equestrian, in bronze, and the cost will not exceed 1,300l. delivered in Melbourne. The pedestal is to be constructed locally. Designs are being received by the Agent-General for Victoria for transmission to the committee.

- Class 11.—The Herne Hill Rustic Works, a bronze medal.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent Manchester grates to the new Police Buildings, Llanfairfechan.

AT Stanwix, Cumberland, parish church an illuminated quarter-chime clock, with three large dials, has been erected by Messrs. Wm. Potts & Sons, clock manufacturers, of Leeds and Newcastle.

A LARGE clock is about to be erected in the new Victoria Hall, Ellon, Aberdeen. It will have three large illuminated dials and strike the hours. Messrs. John Smith & Sons, Midland Clock Works, Derby, are carrying out the work under the instructions of Mr. William Davidson, architect, Ellon. The same firm made a similar clock some years ago for Mintlaw, a neighbouring place.

MESSRS. KORTING BROS., of 53 Victoria Street, S.W., announce the conversion of their business into a private limited liability company, which will henceforth be carried on at the same address with the former staff and under the management of Mr. Ottocar Lindemann, who has been connected with the firm for more than twenty years, and who has now been appointed managing director under the style of Korting Bros., Ltd.

MESSRS. JOHNSON & PHILLIPS, Electric Cable Works, Old Charlton, Kent, have sent us their new illustrated catalogue (No. J. B.) of Main's disconnecting feeder, fuse and other boxes, frames and covers and other appliances. The designs embody the latest and most approved practice, and have special features which give efficiency and ease of manipulation. Messrs Johnson & Phillips remind us that they are always prepared to make special designs and tender for special work.

BUILDING AND BUILDERS.

On the 2nd inst. Colonel A. G. Durnford, R.E., Local Government inspector, conducted an inquiry at Skegness concerning the Urban Council's application to borrow £3,360 for new sewerage works. The scheme was explained by Mr. J. R. Elliott, representing the engineers, Messrs Elliott & Brown, of Nottingham, and consists of new bacterial purification works, additional pumping-station, and improvements and extensions to the sewerage system rendered necessary by the rapid growth of the district. There was no opposition.

THE foundation-stone laying ceremony of the United Methodist Free church, Highams Park, E., took place on

CATHEDRAL SERIES.—EXETER: SOUTH AISLE, LOOKING EAST.

Saturday last, October 3. The building occupies a prominent corner site. The design is in a late period of Gothic freely treated. The facings are in pressed red bricks, and the dressings are in white Costessey work. The block comprises church with transepts and apse and two vestries and the usual conveniences. The contract amount of the building is 1,828*l*. This building will form the school when the future church is erected, and is only the first portion of a large scheme. The architects are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, W.C.

THE possibility of the North-Eastern Railway Company making Northallerton one of their greatest goods collecting and distributing centres has long been a subject of discussion, and at length the directors have decided upon a colossal scheme, which is estimated to cost 520,000*l*. The land required has been secured near Northallerton station on the west side of the main line between York and Darlington, extending about a mile southward. On this land will be erected a siding, the largest in the world, where will be dealt with the whole of the main goods traffic on the system. Northallerton will not be able to contain the immense number of men who will be required to work this siding. The company therefore intend constructing a model village in which they will be housed. The plans already prepared provide for 500 houses.

THE foundation-stone was laid on the 30th ult. of the new Wesleyan chapel which is in course of erection at Staveley on a conveniently situated central site on the main road to Chesterfield. Messrs. Gordon & Gunton, London, are the architects, and Messrs. Lee & Kirk, Alfreton, the builders.

The church is to accommodate 506 worshippers, and Sunday school, which will be added in the future, will provide room for a large number of scholars. The church will be erected in the Gothic style, of pressed bricks fired and treated with Bath stone dressings, which will be used for arches, windows and traceries. The ground plan is cruciform with nave, transepts, apse and vestries. The windows will be glazed with coloured cathedral glass, and the seating is to be of pitch pine. The floor will be of solid blocks, and a waggon-headed roof will be covered with green slates.

EARLY on Saturday morning a man named George Walker, aged forty, married, and residing at 134 North Street, Glasgow, met with his death under distressing circumstances. The deceased, who was a slater by trade, was working along with another man named James Stewart, a foreman slater, of 42 Hutcheson Square, on a swing scaffold, erected about 40 feet from the ground in front of the Wellington Commercial Road. Adjoining the one on which Walker and Stewart were standing was a disused scaffold, which the foreman ordered to be removed. In order to loose the ropes which secured the pulleys two men had to go inside the building, and as the ropes connected with the used and disused scaffolds were only 6 feet apart, one of the men unfortunately loosened the wrong rope, with the result that the scaffold on which Walker and Stewart were working canted. Walker fell to the ground and was killed instantly, whilst Stewart managed to get hold of a rope, and escaped with a slight bruise on his shoulder and severe shock. A medical examination of the body of the deceased man showed that death was due to fracture of the skull.

PLANS have been prepared and passed for the erection of a new school in connection with the Wesleyan chapel, Kimberworth, near Rotherham. The arrangement consists of a central hall 59 feet long by 29 feet wide, with classrooms opening direct into it on either side, having glazed screens between with lifting sashes. Separate entrances are provided for boys, girls and infants. The infants' classroom is 22 feet by 12 feet 6 inches, and is divided from the central hall by a folding glazed partition, the whole of which can be folded up, and the infants' room would then form a transept additional to the assembly hall. One classroom (or part of it) can be used as a minister's vestry, and has a lavatory, &c., and separate entrance adjoining. Storage for benches is also provided on the ground floor, which would be found handy for temporary removal of children's benches preparatory to chapel service.

BRITISH MANUFACTURE

HIGH-CLASS ENAMELS

For all DECORATIVE WORK.

“O” QUALITY “INDIAN” QUALITY

FOR INSIDE USE. FOR OUTSIDE USE.

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c. directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.
EASY FLOW AND MANIPULATION UNDER THE BRUSH.
ENORMOUS COVERING PROPERTIES.

USED SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

to make use of the great fall in the site a basement is at the front, which consists of a church parlour by 11 feet 6 inches, ladies' lavatory, also a kitchen, vault and coal place. A staircase communicates from ment to the floor above, but there are also separate from the road. It is proposed to heat the ground- ms with pipes and radiators on the hot-water low- system. Ventilation is secured by wall brackets and casements as inlets and extract roof-ventilators as A salt-glazed brick dado 4 feet 6 inches high runs central hall. The accommodation is as follows:— including the classrooms, about 480; or adults, classrooms but including transept, about 350. The Gothic. The front and portions of two side elevations special 2½-inch thick pressed bricks from Sha'ton, near the remaining elevations being of local bricks. The e-ration will also have Stoke Hall stone dressings and tiered windows. Mr. J. E. Knight, of Rotherham, is el ect.

VARIETIES.

village church has been opened at Gosberton near Spalding, by the Bishop of Lincoln. The new which has been built to accommodate 120 persons, of a nave, chancel and vestry. The cost of the building is £1,300. The architects were Messrs. W. Bucknall & J. r, of Westminster, and the contractor was Mr. Wm. St. Neots, Hunts.

richly carved figures of SS. Chad, Aidan and c, with their respective emblems, were fixed last week w church of St Chad, Bensham, Gateshead-on-Tyne, ers. Hicks & Charlewood, architects, Newcastle-on- two more figures over the porches were placed in on the new church at West Hartlepool. They were d and Aidan, the former being the patron saint of the. All the above were the work of Mr. G. W. Milburn, York.

SE of about an acre in extent has been secured, at a of £1,000, in Tyndall's Park, Bristol, for the new Baptist or the West of England. It is situated near to the rty College, at which the students take their arts end to Western (Congregational) College, where they me of the theological classes. The present building

at Stokes Croft is said to have been erected from plans originally designed for Dartmoor Prison.

A NEW police-station which has been erected in Mill Street, Bradford, Manchester, was opened on the 1st inst. The station has cost 25,000/., and will take the place of the old headquarters of the C Division in Fairfield Street, as well as of several sub-stations. The building contains separate departments for police and firemen, together with housing accommodation for several men of both forces. In the police department there are thirteen cells, and these, like the rest of the building, are lighted by electricity. The fire department at the corner of Mill Street and Rhyl Street has been arranged on most modern lines, with open stalls for the horses on either side of the engine-house, and sliding poles from the men's quarters on the floor above. The new station contains a section of the Horse Ambulance Corps.

ELECTRIC NOTES.

THE Belfast City Council have unanimously approved a scheme for the purchase and electrification of the tramway system of Belfast submitted by a London civil engineer expert at a cost of close upon a million pounds, including the purchase price from the owning company. It was also decided to promote a Bill in Parliament for the purpose of acquiring the undertaking.

THE Bexley Urban Council's electric-lighting and tramway schemes have now been completed. About 100,000/ has been expended on the scheme. There are 5½ miles of tramways. They extend from the terminus of the Woolwich and South-East London tramway at Plumstead, and traverse the old Dover Road through Bexley Heath to the Dartford Rural Council's boundary, and branch off to the left to the boundary of Erith parish, thus supplying connections for future tramways in these two directions.

A REVOLUTION in the method of producing electricity is promised by Mr. Edison. If all that is claimed for it proves to be justified it will mean a triumph of electricity over petroleum as the motor force of automobiles, and it will also be a wonderful jump forward wherever electricity is required for lighting or driving power. The invention consists in the discovery of a substance not hitherto used in the generation of electricity. Three pounds of it are said to be sufficient to secure enough electricity to light a house or run an automobile for a day, at a

less cost than petroleum. To produce this amount of power for the light mentioned or to run the automobile Mr. Edison has invented a generator, costing 90%, with a base 6 feet square and 5 feet high, rather too cumbersome for automobiles.

THE Inverness Town Council have resolved to accept the offer of Edmundson's Electricity Corporation, Ltd., to establish and carry on the lighting of the town by electricity. The company has agreed to repay the costs incurred in connection with the provisional order, and they will have the option of terminating the permanent lease by giving twelve months' notice at the end of seven years, or the end of any subsequent term of seven years, the price to be paid by the Town Council to be the capital expended by the company with the addition of 15 per cent., and of a sum sufficient to make up profits to 5 per cent. per annum. The works must be completed within twelve months from date of lease. The company will adopt the system of free wiring. The Town Council selected the offer on the recommendation of Messrs. Buchan & Hogarth, consulting electrical engineers, Edinburgh. At the same meeting Mr. John F. Smith, Wolverhampton, was appointed borough surveyor.

AN experimental test of the Brighton Corporation's telephone system, upon which about 45,000% is being expended, took place on Monday, when the mayor (Mr. Alderman Buckwell) opened the exchange by ringing up and conversing with a number of the subscribers. Everything worked satisfactorily, and good wishes were expressed for the success of the undertaking. The area covered by the license extends to Burgess Hill on the north, Shoreham and Steyning on the west and Rottingdean on the east, and the subscription of 5% 10s. per annum for unlimited service covers the whole area, without extra charge, while subscribers may also speak to any other town in the United Kingdom over the Post Office trunk wires on payment of the usual fees. Up to the present, 25 miles of duct have been laid within the borough of Brighton, and the work of laying ducts within the borough of Hove and of connecting subscribers is rapidly approaching completion. The cable drawn into the ducts commences at the exchange at the Royal Pavilion with 626 wires, and extends to the borough boundary on all sides, gradually diminishing, as connections are made with subscribers' premises, to twelve wires at the extremities. The instruments, which are of elegant design and bear the borough arms, are a combination of the latest devices for giving an excellent service with a minimum of trouble to the subscribers. All that is required for a subscriber

to call the attention of the operator is to lift the 'phone rest, and when conversation is finished the replacement 'phone gives the clearing signal automatically. The board is at present fitted for 1,000 subscribers, with an ultimate capacity of 5,000, and the number of applications already considerably exceeded 1,000, the work of extending the board is to be proceeded with at once.

THE FIRST GARDEN CITY.

THE Garden City scheme seems to be at last in a fair way of being carried to a successful issue, a company having been formed bearing the title First Garden City, Ltd., with a capital of 300,000%, in 59,400 ordinary shares of 5% each at 10s. each, and 10,000 preference shares of 1% each. The board of directors is an eminently practical one, numbering among its members some of the most experienced men as Mr. Edward Cadbury, of Bourneville, Mr. W. H. Lever, of Port Sunlight, whose experience in some of the most important directions have been so singularly successful. The company has acquired an estate of 3,800 acres and a beautiful pastoral scenery for which Hertfordshire is famous, and to this picturesque spot they propose to attract manufacturers and large employers of labour whose factories and workshops are to be built alongside the railway which intersects the estate. In handy proximity to these, houses for the workers are to be erected, and in order to prevent overcrowding only one house is to be allowed to the acre; in a widening circle residence of a better class will arise, and the outskirts of the estate are to be reserved for agriculture.

The cost of the estate, which is close to Hitchin and 35 miles of London, is 150,000%. The estate is traversed not only by important highways (and new roads will be built where necessary), but for a distance of two and a half miles the Great Northern Railway from London to Cambridge, and it is within one and a half miles of the Great Northern line from London to the north, and of the Midland line from Bedford to Hitchin. The Great Northern Railway Company is prepared to give the company facilities for starting a scheme, and has already erected a station at Letwell in the centre of the estate, which is also fairly near to the Midland and Great Eastern Railways. It is estimated that goods can be taken cheaply to London by road. There are 52 trains per day to and from London, and Hitchin, a number of which take only 42 minutes in the journey.

BUILDINGS AND ROADS.

ing clauses are in the draft of the Bill to Amend
the Administration of Highways prepared by Mr.
awson, M.P., chairman of the Departmental Com-
Highways:—

land fronting, adjoining or abutting on any main
art of any main road, repairable by the county
in process of being, or is about to be developed for
urposes, and an addition to such road is required in
ake it adequate for the probable increase of traffic,
council may resolve to level, pave or metal, channel
good such addition, and may apportion the expenses
them in so doing on the owners of the land front-
ing or abutting on such addition or part thereof,
to their respective frontages, with power to recover
ses, either summarily or by action, in any court of
jurisdiction.

ounty council may from time to time make by-laws
whole or any part of their county with respect to:—
line of new buildings to be erected on any land
 adjoining or abutting on any main road repairable by
at council.

level and width of any such main road wherever
ing, adjoining or abutting thereon is in process of
about to be developed for building purposes.

visions of sections 157, 158 and 159, and of sections
of the Public Health Act, 1875, shall, so far as
and with any necessary modifications, extend and
ch by-laws.

erson who sustains any damage, by reason of the

operation of such by-law as affecting his property, shall be
entitled to compensation, to be paid by the county council, and
any dispute as to the fact of damage or amount of compensa-
tion shall, in case of difference, be settled by arbitration.

In the case of houses and buildings situate in or abutting on
any main road repairable by the county council, the county
council shall have and may exercise and perform all the powers
and duties which an urban district council have and can
exercise and perform under section 155 of the Public Health
(Buildings in Streets) Act, 1888; and those sections shall in
such cases be read and have effect accordingly, whether the
main road is, or is not, situate in an urban district.

Provided that the county council shall not exercise the
powers hereby conferred in any case where the district council
have already put in force their powers under the above-
mentioned sections in respect of such houses and buildings.

URALITE.

THE British Uralite Company, Ltd, of 50 Cannon Street, are
issuing a handsomely got up illustrated booklet containing a
number of views of buildings in the construction of which Uralite
has been largely employed. Of the value of Uralite as a fire-re-
sisting building material we have already had several occasions to
write. The scope of its applicability appears, however, to be
constantly widening out, and we are informed that for
engineers it is useful in several directions. Fireproof washers
can be made from it which are excellent for joints subject to
high pressure. Being a non-conductor it is valuable for boiler
covering and for locomotive boiler lagging, economising steam
and preventing the heat from escaping to the outer steel casing,
preventing blistering of paint and varnish, and adding to the
life of the machinery. For insulating cold-storage chambers
its fireproof, non-conducting and vermin-resisting properties are
of great importance. By the application of Uralite the thick-
ness of the insulation necessary is reduced, and on board ship
a saving in weight is effected, a saving of time occupied in con-
struction, and additional cargo space is obtained. Every square
foot of timber which can be dispensed with on board ship
means that there is a greater factor of safety for both crew and
passengers, and reduced chance of serious conflagrations.
Uralite, on these grounds, is worthy of the attention of the
shipbuilder, the shipowner and the underwriter.

A NEW SEWAGE DISTRIBUTOR.

ONE of the greatest difficulties in connection with sewage disposal for small installations is that of getting even distribution over the whole bed, and this difficulty seems to have been grappled with successfully in an apparatus which has been brought before our notice, viz. that of Mr. William E. Farrer, of Star Works, Cambridge Street, Birmingham.

The apparatus consists of an automatic tipper throwing

In the case of the apparatus now under discussion, difficulty has been entirely avoided, and the size of the tipper is accurately gauged, so that the channels are always evenly charged, and the amount of head in the channel is such that the whole bed is successively sprayed.

Another point is that the section of the channels is such that it insures their being entirely drained after each successive charge. Experience has proved that with this apparatus the bed is never overdosed at one period of its working and so

alternately on to the two halves of the bed, the great point about it being that until the necessary amount of sewage has been collected to cover the whole of one side of the bed, it will not commence to work. As our readers are aware, with only too many of the automatic sprinklers the trouble lies in the fact that unless they obtain a maximum supply of sewage matter, the sprinkler ceases to revolve, and the sewage trickles on to one part of the bed.

another, the distribution being always equal, thus insuring a good effluent. As will be seen from the illustration, the apparatus is a simple one, and is not likely to get out of order, nor does it require much attention. The whole thing is easily adjusted, and any part of it may be readily taken apart should occasion require.

We can, then, confidently recommend Mr. Farrer's apparatus to the critical consideration of our readers.

THE MARLBOROUGH THEATRE.
 A beautiful new theatre which has been erected in the Road was opened on Monday evening, and at once amongst the handsomest and most commodious the Metropolis. Mr. F. W. Purcell, already favoured to North Londoners as the enterprising proprietor of the Alexandra Theatre in Stoke Newington, is also the new theatre, which has been erected from the Mr. Frank Matcham, and visitors will be at once the air of spaciousness which pervades the interior, constructed to seat no less than 3,000 persons, and have a perfectly unobstructed view of every portion of the stage. Another noticeable feature is the abundance of the exits, the provision of which, the the site, which is on all sides isolated, has greatly the frontage of the building is set back from the this space is laid out with a carriage approach to the doors, the centre being occupied with a shrubbery and with railings and piers.
 The elevation towards Holloway Road is carried out in bold of French Renaissance style, it is faced with dark with buff terra-cotta dressings and ornamentation; the centre entry doors devoted to the patrons of the stalls is an arched balcony with curved balustrading, the doors open from the dress circle saloon, and over a loggia is formed from the upper circle saloon surmounted by a large gable containing a female figure of the attendant boy figures, the whole surmounted by a dome. The entrance vestibule is treated in Jacobean a geometrical moulded ceiling and ornamented drops of lamps hanging from each of these; a deep ornate is formed around the walls above a high panelled dado. On each side of the staircase columns support a coffered arch over the main the panelled mahogany dado is carried up the and leads to a beautiful Louis XV. foyer with fibrous plaster dome-shaped ceiling with various light pendants hanging from special positions, and the walls filled in with gold lustrette. The side with white and black marble, and a marble leads to the dress circle. From the foyer four lead to the dress circle seating, two opening into the galleries and two at the sides, where handsome open arcading and balustrading divide those entering the those seated in the dress circle. The upper circle

is set back from the dress circle, but raised sufficiently high as to constitute a separate tier; there are eight rows of velvet upholstered seats with a wide promenade at the rear. The gallery is an immense one, the sight lines being perfect; the walls are lined with glazed brick, the ceiling is lofty, and there is a large lantern light over a great part of the gallery, giving light and ventilation. The safety of the public has had every consideration. The whole theatre is built of fireproof material, hydrants fully equipped abound throughout the building, there is a fireproof curtain dividing the auditorium from the stage, and the exits are numerous, and no long tortuous passages are formed, everyone having a clear way to and from their seats.

In the decorations and furnishings Mr. Matcham has very effectively adopted the up-to-date style of *L'Art Nouveau*. It is finished in tints of cream and gold throughout with the exception of the ceiling, in which a remarkably beautiful effect is obtained by an indefinitely outlined treatment in blue, which, with the electric lights with which it is studded, produces a summer-skylike effect which is as original as it is pleasing. The hangings and upholstery are in a rich shade of copper velvet, with touches of dark green appliqué. The stage measures 43 feet by 76 feet and 56 feet to the grid, and is capable of staging the largest productions.

Messrs. Patman & Fotheringham were the general contractors and were also responsible for the ornamental woodwork; expanded metal (the New Expanded Metal Company) was used for ceilings, arches, &c., throughout; heating and fire-hydrants were by Messrs. Oldroyd & Co.; Messrs. Blackburn & Starling carried out the electric lighting, for which the very effective fittings were supplied by Messrs. Osler; the Fibrous Plaster and decorations were by Messrs. F. De Jong & Co.; the carpets, draperies and furnishing by Messrs. Maple & Co.; the seats, in which an ingenious improvement was noticeable, were supplied by Messrs. Lazarus & Co.; and the lead-lights and ornamental glazing were executed by Messrs. Pepper & Co.

SUNDERLAND HARBOUR OF REFUGE.

THE conclusion of an important undertaking of the River Wear Commissioners was signalled recently, when, to record the completion of the Roker Pier, a large polished block of black granite was placed in position in the lighthouse at the extremity of the pier by the Earl of Durham, Lord-Lieutenant of the county. This great scheme, which has been

NEW CATALOGUE FREE ON APPLICATION.

carried out at a cost of over half a million sterling, was inaugurated eighteen years ago. The scheme embraces the construction of two enormously strong piers of granite and concrete on the north and south sides of the river, which will render safe the entrance of vessels in any kind of weather, and also form a splendid harbour of refuge which will not be equalled on the north-east coast of England. The immense granite and concrete blocks, weighing up to 56 tons, used in the building of the piers have been constructed at works belonging to the Commissioners, where they have been placed upon waggons by a Goliath crane, and then lifted into position at the Roker Pier by means of a 60-ton hydraulic radial crane. The length of the pier just completed is 2,800 feet, and the new pier in course of construction on the south side of the river will be 2,844 feet in length, of which 2,299 feet have been constructed. The width of the Roker Pier is 35 feet for a distance of 2,000 feet out, and for the remainder it is 41 feet. The height of the pier above high water is 10 feet. At the extreme end of the pier an enormous round head has been constructed on a foundation 40 feet below low water, and rising to a height of 18 feet above the level of high water, the total height of the structure being 72 feet 6 inches. It rests upon a caisson 101 feet long by 69 feet wide, which, when sunk into position, was filled with 10,000 tons of concrete. The lighthouse erected upon this structure is of red and white granite, and rises to a height of 54½ feet, its diameter at the bottom being 31 feet, gradually reduced to 16 feet at the summit, and the lantern has a diameter of 10 feet. The light, it is said, will be the most powerful port light in the kingdom and the quickest flashing light; its focal plane is 83 feet 6 inches above high water.

VENTILATION OF TUBE RAILWAYS.

FROM the paper which was read by Mr. J. W. Thomas before the British Association, the ventilation of tube railways is quite practical, for the forces brought into play by the moving trains and the natural heat of the tubes will be ample if properly directed. According to him, in tube railways, if B is the centre of three stations, the down train moving from A to B will draw air from the A station into the tube, and expel it in the B station, and the up train moving from C to B will draw air from the C station into the tube and expel it in the B station. Three stations are thus directly involved, and a triple-station arrangement will best fulfil the physical conditions. Owing to

the elasticity of air the outlets for expelling the vitiated sphere must not be situated far from the points of compression, and should begin in the centre of each station underground, and end in the open air above the station surface. For the same reason the intakes for fresh air should be close to the points where the sudden expansion of the air begins. These points are at the ends of the tubes where the moving trains enter. Doors can be fixed at the ends of the two tubes which the trains enter in each station, and closed behind the last trains at night, so that the fresh air will be driven into the end of the tube immediately beyond the station. The drive out the foul air into the next station by natural pressure. The providing of fresh air inlets inside the tubes, the tubes which the trains enter, with an outlet shaft at the centre of each station, will enable the moving trains to draw in and expel enough air to keep the atmosphere in each station in good condition, even in hot summer weather. In addition to this, however, there are two auxiliary aids to ventilation which the stationmasters to make certain that the state of the atmosphere in the tubes is satisfactory. 1. Having inlets at the ends of the tubes as above, the timing of the departure of the up and down trains as they move towards the same station will draw enormous volumes of air to be driven to the surface, the corresponding volume will be drawn in. 2. By closing the doors after some of the trains as they leave the station, the air must be drawn into the tubes. As the sectional area of the Central London Railway is rather limited, it should be difficult to carry out arrangements similar to those suggested by Mr. Thomas, but temporarily. The air in the sections could be tested, and if any improvement was required, then more permanent arrangements could be introduced.

SOCIETY OF ENGINEERS.

A VERY interesting visit was made by the president (Mr. Patten Barber) and members of the Society of Engineers on Wednesday, September 23, to the electricity generating station and one of the baths and washhouses at Islington, under the kind permission of the Islington Borough Council.

The Electricity Works.

These works are situated in Eden Grove, Holloway, on the south side of the Great Northern Railway, and in a position practically the electrical centre of gravity of the district. The system adopted for supply is high-tension alternating current, with street tank transformers as sub-stations.

Telephone No 773 King's Cross. Telegraphic Address, "Veneer, P."

works consist of a range of buildings comprising boiler-house, double-bayed engine-room, old boiler-houses, workshops and auxiliary plant-room, yard and cooling tower. The offices have been sited to come between the works and the Catholic church of St. Red Heart, which lies south-east of the works and is reached by a rail-borne, and delivered on a private siding from the Northern main line. The siding is continued through the works, and by means of permanent ways over the coal and both boiler-houses; railway waggons can be lifted directly into the bunkers, a special tipping gear being provided for the purpose. The boiler-houses are excavated so that the firing floor is 10 feet below ground level. They contain (old boiler-houses) Babcock and eight Lancashire, and (new boiler-houses) Babcock boilers of the following sizes:—

Lancashire Boilers.

No. of Flues.	Grate Area.	Normal Evaporation in lbs. Water at and from 212 degs. Fahr. per hour.
2	33 sq. ft.	About 6,000 lbs.

Babcock.

	Number of Tubes.	Diameter of each Tube.	Heating Surface.	Grate Area.	Normal Evap- oration in lbs. Water at and from 212° F. per hour.
		Inches.	Sq. feet.	Sq. feet.	lbs.
id 2	72	4	1,624	30½	5,500
d 12	81	4	1,827	33½	6,500
o 22	252	4	5,540	76	16,000

steam pipes are arranged so that the boilers are direct to the engines, and by means of an equalising boiler can be connected to any engine, or the whole can be run together. By this means the large steam rings favoured in electricity works have been avoided, and heat losses reduced. The engines consist of the following:—Wheellock cross-

coupled compound, run at 95 revolutions, with a steam-chest pressure of 125 lbs. to 150 lbs. per square inch:—

No.	Horse Power.	Kilowatt Capacity of Alternator.	Maker of Alternator.	Method of Connection.
2	250	125	Fowler	Rope driven
1	250	125	Fowler	Direct coupled
1	250	125	Ferranti	"
3	500	300	Ferranti	"
3	1,000	600	Ferranti	"

There is also a combined engine-driven motor generator, consisting of Reavell high-speed 80 horse-power engine, Crompton 40 k.w. high-pressure alternator, and Crompton 20 k.w. dynamo used for charging cells and day plant.

The switchboard is situated on a gallery which is extended across a portion of the width of the engine-rooms at one end, and along the engine-room down the centre so as to command a view of every part.

The high-tension machine board is a fourteen-panel Ferranti 500 ampere board, split in halves, with the usual regulating gear instruments, fuses and synchronisers. On either side are the circuit boards of the Fowler plug pattern, and on the extension gallery is the arc circuit switchboard by Cowan's, Ltd.

The alternators are run in parallel upon bus bars, and the rule adopted is that speed is adjusted for frequency, steam is adjusted for load and excitation is adjusted for volts.

For street arc lighting there are five 30-light and three 50-light rectifiers, with two boards, one of the 1895 and one of the 1902 pattern by Ferranti, and five alternating series constant current transformers.

The street lighting now consists of 473 lamps made up as follows:—Four circuits with a maximum of thirty lamps each, twelve amperes rectified; two circuits with a maximum of fifty lamps each, ten amperes rectified; six circuits with a maximum of thirty lamps each, high-tension constant pressure alternating with transformers in base of each lamp-post for the individual lamp; four circuits with a maximum of thirty lamps, constant current series alternating with compensators in the series circuit, and across which the lamps are connected. For side-street lighting experiments have been made with the Reason Company's, the Improved Electric Glow Lamp Company's and Nernst fittings.

Warehouses, Race Stables, and Private Houses.

FIRE ESCAPE STAIRCASES.

HERRING & SON,

Ironfounders & Engineers,
CHERTSEY, SURREY.

Makers of Every Description,
CAST & WROUGHT.

ESTIMATES GIVEN
ON RECEIPT OF PLANS.

QUOTATIONS FOR CASTINGS.

The distributing system in the past has consisted of cast-iron pipes containing double concentric rubber insulated steel-armoured cables as high-pressure feeders and distributors, also vulcanised indiarubber double concentric steel-armoured cables drawn into 3-inch earthenware pipes. Extensions are now being laid with paper insulated twin arc cables, double concentric paper insulated high-tension feeders and triple concentric paper insulated low-tension distributors, all laid on the solid system.

The meters in use are Chamberlain & Hookham, Hummell, Guttman, Westinghouse, British Thomson-Houston, Aron, Stanley; and Reason demand indicators are fitted where the sliding-scale method of charging is adopted.

The Baths and Washhouses.

The Hornsey Road baths and washhouses are the largest of the three establishments under the control of the Islington Borough Council. They were designed by Mr. A. Hessel Tiltman, F.R.I.B.A., and were opened in 1892; they were enlarged in 1899, and now consist of:—

Men's 1st-class swimming-bath, 132 feet by 40 feet.

Men's 2nd-class swimming-bath, 100 feet by 35 feet.

Women's 1st-class swimming-bath, 75 feet by 25 feet.

Women's 2nd-class swimming-bath, 75 feet by 25 feet.

36 men's 1st-class slipper-baths.

72 men's 2nd-class slipper-baths.

10 women's 1st-class slipper-baths.

27 women's 2nd-class slipper-baths.

The public washhouse contains 49 washing troughs and 4 hydros, and is fitted with 50 drying-horses heated by steam. Immediately adjoining the washhouses is the mangling and ironing-room. The establishment washhouse is fitted with one rotary washing-machine and two hydros, the towels being dried in a room heated by steam. The whole of the fittings in the washhouses and mangling and ironing-rooms were manufactured and supplied by Messrs. Bradford & Co., Crescent Iron Works, Manchester.

The water supplied to the swimming-baths is heated on its way thereto by the injection of steam into the water main at two points. The original method of heating the water for the slipper baths has been abandoned, and it is now heated in two large cylinders by passing steam through pipes placed in the cylinders, the steam having first been used for heating the drying-horses in the public washhouse. Steam can also be

supplied direct from the boilers for heating the water in cylinders.

A portion of the water used in the establishment is from two boreholes in the engine-room, each borehole 13 inches in internal diameter and 450 feet deep, the water in each boring being lined with 8-inch steel tubes, the chalk being reached at a depth of 200 feet from the surface. The water has the characteristics of a good water, and is fit for drinking purposes. It rises in holes to a height of 165 feet from the surface and has a temperature of 55 degs. Fahr. The total yield from the holes is about 14,000 gallons of water per hour.

Pumps, 9 inches in internal diameter, are fixed in the holes with the bottoms of the working barrels 270 feet from the surface, the pumps being worked by a pair of 10-horsepower 20-inches Marshall's "K" class horizontal, single-cylinder condensing engines, and may be worked singly if required.

The water is pumped through a 9-inch main to the establishment laundry, where it is heated by a boiler at about 70 deg. Fahr., the water then being delivered by a pump where required. Water is also pumped through a 9-inch main to a tank over the board-room for use as cold water for the slipper baths. At present there is insufficient capacity for the water required, so that the pump is intermittent, the supply being supplemented by water from the New River Company's main. A scheme for obtaining sufficient water for all purposes is under consideration by the Council, and if adopted will enable the entire supply to be obtained from the boreholes.

The steam required for driving the engines and for other purposes is obtained from two Lancashire and two Babcock & Wilcox boilers, all condensed steam being collected and again in the boilers with the exception of that from the Lancashire which is raised by an injector and discharged into the condenser. At present there is no means provided for removing the steam.

Electricity is used throughout for lighting the buildings, being generated by three dynamos manufactured by the Electric Construction Company, Wolverhampton. The power for working the dynamos is also obtained from the Lancashire mentioned boilers. The buildings are heated by means of water pipes and radiators.

The entire cost of the buildings and equipment was about £280,000, and since the opening they have been used by about 1,000 bathers and washers, the attendance for the year ending 1902 being about 280,000.

RAILWAY DEVELOPMENT IN IRELAND.

tors of the Great Northern Railway Company, an extraordinary meeting of the proprietors convened at 11, Henrietta Street, Dublin, on Tuesday, October 6, passed resolutions authorising that company under the powers conferred upon them by the Castleblayney, Keady and Banagher Railway Extension of Time Act, 1903, to subscribe to the necessary capital, namely, 350,000*l.*, for the construction of the Castleblayney, Keady and Armagh Railway, which will be proceeded with.

for the construction of a line from Drogheda to Banagher in connection with the steam-packet service to that place, and the Lancashire and Yorkshire Railway, was discussed at a session of Parliament, the capital for which is

the engineer for both these lines is Sir Benjamin Baker, Bt., and the contracts for construction, amounting to 1,000,000*l.*, have been placed in the hands of Mr. Robert Gordon, J.P., of Dublin.

GERMAN AND LONDON HOUSING.

German, thirty-seven in number, who are now in London, have come on a twelve-days' visit to England to study the British methods of housing the working classes. These gentlemen have which tend to the welfare of the working classes belong to the German Central Department for the Propagation of the German Benefit Institutions, a body which was founded in 1890 on the suggestion of the then Prussian Minister of Commerce. This body is subsidised by the Governments of Prussia, the German Federal States and the Imperial and Prussian Governments, who have the right to be represented on the committee which forms the central point in Germany for all endeavours of the working classes outside dispositions by the Government. It does much good work by giving information, by publishing journals and periodicals, holding conferences and sending out journeys as the present one for the purpose of gathering information and suggestions from what is being done in other countries. The manager is the reporting councillor of the Prussian Ministry of Commerce. Speaking to a repre-

sentative of the *Manchester Guardian*, Dr. Von Erdberg, one of the leaders, said:—

We have among our party representatives of many working men's benefit societies in the different principal towns—Karlsruhe, Düsseldorf, Dresden, Altenburg, Frankfurt, Hanover, Bremen, Berlin, and others. With us also is the Burgomaster of Charlottenburg and the Senator of Bremen, one of the three burgomasters in Germany—those of Bremen, Hamburg and Lübeck—who as chief citizens hold that title. We have with us, too, Herr Schmohl, the housing expert for Messrs. Krupp at Essen; some high officials sent by the governments, and some manufacturers. It may interest you to know that, though in no way chosen as delegates on that account, no fewer than fifteen of our party hold the University degree of doctor. We return on October 6. So far we have visited some of the slums of Whitechapel, the wonderful Rowton House there, the most excellent blocks of dwellings built by the London County Council on the Boundary Street estate, the Stepney workhouse, the German Seamen's Home in Mile End Road, the lodging-houses and clubs at the Red House, Commercial Road, and the Victoria Temperance Homes in Commercial Street, the Bethnal Green Museum, and the "Mansfield House" settlement in Canning Town.

What we have been most struck with so far has been the Rowton House at Whitechapel. We were amazed at its completeness and its perfection, the care bestowed on details, its superb cleanness and its inspiring determination that everything about it should be beautiful. There is nothing like it in Germany, and we shall endeavour to imitate it on our return. We have only the lodging-houses and refuges established by religious societies. With them the charges are less than at the Rowton House, but they are charities, and there are no beautiful common-rooms, recreation and reading-rooms. We were much delighted to hear Sir Richard Farrant tell us that these noble houses, so superbly built and so lavish in space and other accommodation, have proved to be possible on a commercial basis, and will pay 4½ per cent. interest. Ground with us is cheaper, and we anticipate no difficulty in following Lord Rowton's fine example. We have seen nothing that could do more hopeful work in lifting men and keeping them from sinking into the lower stages of poverty. Our only difficulty would be that with us they would be seized by the thrifty. I think the Rowton House a living monument, showing how excellently the poor can live with proper common management. We shall have an advantage in this, that our working men's societies,

once assured that these buildings will return 4 to 5 per cent, will consider them a sound investment.

I have been struck by this, that we find none of your working men's societies building dwellings. With us we do that. We admired the County Council dwellings at Boundary Street, but chiefly on account of the change that had been effected and for certain details, such as the bath for each tenement. But we are surprised at the number of one-room tenements you have. We have very seldom such a tenement. Ours are two rooms and a kitchen and three rooms and a kitchen chiefly, and the rooms—at any rate, one room if not all—in each tenement are larger than yours. Then, too, we have common libraries and reading-rooms, and recreation-rooms for the children, for the use of all the tenants. We, however, generally have only one bath-house for every twenty families. That is not quite so good, but then we supply the hot water for all at all hours of the day, which is better. Our rents, too, are cheaper than yours. With us the working men's societies build for, say, a thousand families. That is very good, for in a way most of the tenants feel that they are their own landlords, and they take great care of their rooms. But men with us, I think, pay much less in rent in proportion to their earnings than is paid by your working classes. A German workman earning 2*l.* 6*s.* a week would not pay more than 5*s.* a week, or at the highest 7*s.* 6*d.* a week for rent, taking an average of the dearer and cheaper towns. Yours would have to pay up to 12*s.* 6*d.* a week, or even 13*s.*, I am told.

We have been surprised at the magnificent width of your East End streets, and still more astounded when told that some of those grand thoroughfares were slums. Why does not your Parliament interfere? There are such opportunities. Your charitable efforts are equally amazing—but your working classes do not attempt to help themselves as ours do.

MODERN SEWAGE TREATMENT.

A PROVINCIAL sessional meeting of the Sanitary Institute took place in Birmingham recently. In the morning a number of the members visited the new crematorium near Perry Village, which Sir Henry Thompson, Bart., is to publicly open in a few days. Mr. Murray N. Phelps (hon. secretary) and Mr. J. E. Willcox (engineer) were present, and under their direction the visitors inspected the building and appliances and witnessed a practical demonstration of the methods. Later in

the medical lecture theatre of the University, a conference held under the presidency of Dr. Alfred Hill. The subject of the discussion, as reported in the *Birmingham Daily Post*, was "Some Practical Considerations in Connection with Modern Methods of Treating Sewage." In opening the proceedings the chairman dwelt on the importance of the subject. It was important to the health of the community, and it was important particularly as regards the command of land on which to treat sewage. To obtain such land was by no means an easy matter. There was no land available which was unsuitable, or there might be no land available. In such cases the bacterial system was of timely assistance. He remembered thirty years ago the condition of the Birmingham sewage farm. He was consulted in the earliest days of his office as medical officer, and it was considered necessary to improve the conditions of the sewage farm. Those conditions were of the most deplorable. Nothing was done but to run the crude sewage through a filter where all that "chose to subside" did so, and the rest was pumped to the river, while the sludge and detritus had to be taken to the river. It covered five or six acres of land a couple of years ago. They might imagine what a nuisance that was. They might that day see what had been done under the present system; how much the condition of the farm had been improved. They would see much to admire in the improvements which the improvements had been carried out by Mr. W. From what he could hear the Birmingham farm would bear comparison with any similar institution throughout the country. What struck most persons who did not work on the subject was the marvellous discovery that they could by simple means deal with such a problem. There was nothing new under the sun. Nature had been carrying on the process under their noses through all time, but men had not been observant enough to see it nor clever enough to imitate why it was. The bacterial method furnished the explanation. They were simply imitating nature's own process, as far as they could make it altogether natural so much the better.

Professor Bostock Hill opened the discussion, practically with the remark that when they considered the condition of many of our rivers it was not surprising that they should possess interest. The modern systems of sewage treatment, which meant nothing but either treatment by or by bacterial means, had arisen through a proper understanding of nature's methods in removing waste matter from the soil. In connection with land treatment few

had arisen of late. They knew that it was absolutely essential the proper sort of land could be obtained, and it was efficient in quantity. One of the greatest advances made by the utilisation of bacteriological methods in connection with land treatment instead of utilising precipitation was previously the case. The old idea of preliminary treatment had been abandoned. Although Birmingham and other towns sent down such large quantities of acid effluent, Mr. Watson had shown it possible to treat the effluent without any of the expense or trouble involved by lime or any form of precipitant. Turning to the methods proper, he remarked that, properly carried out, the method of dealing with sewage in large or small towns was a matter of scientific knowledge, it was a perfectly practical method for dealing with sewage in large or small towns. Dr. Hill reviewed the various methods of treatment and remarked that in considering which system was the best they had to bear in mind all the circumstances, the qualities of the sewage, the surroundings of the works, the fall of the land and the character of the effluent into which the effluent was to pass.

Mr. Willcox also read a paper. He remarked that the success largely depended upon overcoming the practical difficulties which arose in connection with the design and construction of the works, having regard to the special circumstances and conditions obtaining in each case. It was impossible to successfully treat all kinds of sewage by similar methods. He proceeded to show the importance of carefully considering the character and volume of the sewage, and then the methods of treatment, such as in tanks, screening, settling chambers, precipitation, sedimentation and filtration. He also discussed land treatment and the comparison which the best results are obtained; the design of materials for the construction of contact beds and filters. The importance of distribution and the design of filters were also considered.

The discussion which followed Dr. Read (Potteries) said he had found that Professor Hill and Mr. Willcox were in agreement in their opinion that filtration was better than contact. It was regrettable that they ever heard of contact. He thought they would probably have arrived at a better opinion of distribution than they had now. Many authorities were agreed in constructing contact beds, and he was afraid that one or two they would regret it.

Mr. Brook stated that in the experiments which he had made with the septic tank with continuous filtration was

coming out much the best. Contact had not reached the high standard which at one time was anticipated.

Mr. Lowcock expressed his pleasure in finding that opinion was coming round to the view that filtration was a great deal better than contact—an opinion which he had held for a number of years.

Mr. A. J. Martin defended the contact system.

Mr. Scott Montcrieff remarked that there was a general opinion abroad that land was the better method of treatment. Theoretically it might be, practically they were all agreed that nine-tenths of English land was unsuitable for carrying it out.

Dr. Barwise did not think a sufficiently vigorous protest had been made against the suggestion of the Royal Commission that sewage effluent should be bacteriologically treated. It was not the duty of the sanitary authority to turn its sewage into drinking water, but it was the duty of water companies and sanitary authorities providing water supplies to take their supplies from unimpeachable sources.

On the motion of Mr. J. T. Eayrs acting local hon. secretary a vote of thanks was passed to Dr. Hill for presiding. In the afternoon the members visited the works of the Tame and Rea District Drainage Board at Tyburn, where Mr. J. D. Watson, engineer, conducted them over the farm.

BAPTIST CHURCH AND SCHOOLS, BRIGHTON.

THE memorial-stones of this building were laid on September 16. The building is to be faced with whole white flints with red dressings, the seating to be in Orham wood wax polished; lead lights to all windows of quaint design; heating by low-pressure hot-water pipes and radiators; electric-light fittings of wrought-iron and copper; ventilation by means of an electric fan. Baptistry lined with white marble, candidates passing direct under pulpit into vestries. The accommodation will be for 443 adults on ground-floor, 282 in galleries, total 725, or a mixed congregation of over 800 persons. A bold central entrance leads to a vestibule and then on each side into inner lobbies and into the aisles of the church, with a glazed screen filled in with lead lights around the lobbies. The seating is arranged on a semicircular plan, each hearer directly facing the minister. The ceiling is domed to give the most perfect acoustic results. A gallery, somewhat of a

horseshoe shape, affords accommodation for 241 persons and a choir-gallery for thirty-three behind the pulpit with a separate staircase.

The church will be lighted by handsome traceried windows of various designs. Three vestries are provided behind the pulpit. Two side entrances in the front elevation lead to staircases up to gallery, having fireproof steps and landings.

The schools are under the church, well lighted from three sides, and will contain accommodation for about 500 scholars in a large schoolroom, infants' room, church parlour and four classrooms, with kitchen, &c.

The church being placed between two rows of somewhat lofty houses necessitates a bold and vertical treatment, which is obtained by a broad gable in the centre, having a prominent portico leading to the church, and above this a handsome five-light traceried window with segmental head, and above it a traceried apex, spandrel and finial, and being flanked on one side by staircase, wing and turret, and on the other by a bold tower rising to a height of 58 feet above the pavement to the parapet, and terminated by a spire covered by oak shingles with wrought-iron vane, 93 feet to the top from the road level. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5 Clement's Inn, Strand, London, W.C. The builders are Messrs. Battley, Sons & Holness, 21 Old Kent Road, London, S.E. The present contract is for 5,381*l.*, exclusive of galleries (except choir-gallery).

NEW WORKHOUSE FOR HUNSLET.

HUNSLET Union's new workhouse, situated near the junction of Wood Lane and Wakefield Road, at Rothwell Haigh, was formally opened in the presence of a large gathering. The site of the new building comprises 18½ acres, which provides ample space for future extension, the present accommodation of the workhouse and infirmary being 450. Future extension is also provided for by the administrative portion of the buildings, stores, laundry, boiler-house, &c., having been designed large enough for a building twice the size. The buildings consist of six groups—the entrance block, main building, laundry and boiler-house, infirmary, lunacy building and isolation hospital. The main building, or workhouse proper, has the administrative block placed in the centre; and connected with this by glazed conservatory corridors are

the pavilions for the male and female aged and infirm classes, with the necessary day-rooms, &c.

The laundry, which forms a separate block, has been fitted with steam-power machinery in the most up-to-date manner. Messrs. W. Summerscales & Sons, Ltd., of Keighley, Yorkshire, have supplied the machinery. It comprises receiving-room, washhouse for general work, a separate washhouse to deal with foul linen; a fine for drying horses, with flannel and blanket drying-rooms heated on the hot-blast system, which not only does with extreme rapidity, but gives a result practically out-of-door drying, and maintains its efficiency in all weathers.

The ironing and finishing room is fitted with modern machinery, and the work, after passing through the department, is taken to the delivery room to be sorted for distribution to the various blocks.

The infirmary is a complete building in itself, and is connected with the main building by a covered conservatory, which is entered the central portion of the building, and from this point conservatory corridors to the left and right lead to the male and female pavilions, which pavilions are divided into wards for the various classes of sick. The nurses' quarters occupy the central building.

The maternity block is in a convenient and quiet position between the infirmary and the main building, and the block for thirty-six inmates consists of ample accommodation for male and female attendants in the centre, with entrance on each side on the ground floor and imbeciles above. The period lunatics are in one-storey buildings at each end, with wards and padded and attendants' rooms. The lunacy block is complete in itself, but is connected with the infirmary by a covered way for administrative purposes. The isolation hospital is also a complete building in itself, situated in a remote position on the south-east corner of the site.

The aged married couples' cottages are on a high part of the site, near Rothwell Haigh, entirely separate from the other buildings, and being next to the roadway will have gardens in front. The buildings are lighted throughout by electricity, and there are two electric lifts at the entrance to the infirmary pavilion. There are nineteen telephone exchanges in various parts of the building, and there is also a set of synchronised clocks.

The total cost of the building, including the purchase of the site, is approximately 85,850*l.*, or 182*l.* per bed.

The Architect.

THE WEEK.

AL authorities who believe it is their duty to launch into a course for providing houses for the humbler classes will do well to study carefully a report which has been prepared by the housing committee of the Birmingham Corporation. We need not say the city has been always in a state of progress. But it has never allowed sentiment to lead it to rash conclusions. The committee find that the city contains houses which, judged by modern ideas of sanitation, are unfit to live in. But they also recognise that the condition is often due to the habits of the tenants, and that people who can afford an increased rent prefer to use better houses. In August of this year there were 785 tenement houses which could be obtained at a rent of 4s. per week. They must be fit to live in, otherwise they would be condemned by the medical officer of health. It is admitted that cheap houses, that is, at rentals under 2s. 6d., have not been built in Birmingham. The causes of the increased value of land, the higher wages (from 30 per cent.) which have to be paid to the building labour, and the increased cost of material. The building laws are also more stringent. There is also a tendency to removal towards the suburbs of Birmingham, which the housing committee wish to encourage. The committee are favourable to municipal housebuilding, because it has been found to be more expensive. The houses have to be let at cheaper rents, and it is plain that rate-aided competition will prevent other people from building. There is consequently a risk of creating a house famine. Since it is known that the Corporation were reluctant to start schemes have been started for the erection of flats for the working-classes. The committee therefore recommend that the Corporation should encourage and, if necessary, compel landlords and tenants to keep their houses in good order; that congested courts should be open to the light; that the by-laws should be modified if required, so that the tram system be reorganised to enable the working-class to live in the suburbs. The subject will be considered by the city council on Tuesday next, and as the recommendations of the committee are based on the views of experts, we suppose there is little doubt that corporate action will be postponed until there is a more urgent necessity for it.

THE Jardin des Plantes is one of the most successful of the educational institutions of Paris. A designer who knows to utilise plants is soon able to know where those he requires are to be found, for a large share of the ground is already laid out to meet his aims. Loss of time in exploration is thus obviated. As the great garden also serves as a museum of natural history, a stranger who seeks plants will first come across the animals, and as they are interesting claims of business may be ignored. It was following to complaints from those who had not taken the trouble to master the plan of the Jardin des Plantes, that it is not a difficult task, that the Municipality of Paris has arranged a garden mainly for the use of artists near the Porte d'Auteuil. It is near many ateliers, but for ordinary designers the position is less convenient than the old garden adjoining the Rue Cuvier. Several artists have been asked to aid the new institution by giving courses of lectures, which will be gratuitous, on the utilisation of plants for various purposes of art. It is well to have rivalry, and art forms are of so much importance in French ornamentation that here can hardly be too much instruction imparted to them.

AMONG the additions to the Berlin Museum are some which must always have interest for English visitors. One is a portrait by RUBENS of ISABELLA BRANT, who was the first wife of the painter. It belonged to the late Empress ELEANOR, from whom it passed to the Prince and Princess ALBERT and PRINCESS CHARLES of Hesse. It was formerly in the collection at Windsor Castle, and was described by WAAGEN as "animated in the expression, clear and blooming, more subdued in the flesh-colour than common, and more finished." There are also some examples of

Renaissance sculpture, which were also part of the property of the Empress. One is a bust of ACCELINO of Salvago, a statesman of Genoa, by ANTONIO DELLA PORTA, known as TAMAGNINI. It is an example of realistic treatment, and is remarkable for its vivid character. Beside has been placed a child's head in bronze by ANTONIO ROSSELINO, whose tomb of a cardinal in St. Miniato is one of the most excellent works of its class. Another work is an admirable wood-carving of St. SEBASTIAN, by an Italian of the sixteenth century. Much attention is obtained by the *Conversion of St. Paul* by RUBENS, which was purchased last winter in England.

ABOUT two months ago we noted the explorations in the grounds of the Palazzo Fiano, in Rome, belonging to Signor ALMAGIA, the contractor, with the object of discovering the Ara Pacis Augustæ, which was set up to commemorate the restoration of peace throughout the empire. It was mentioned that unceasing pumping was demanded owing to the inroads of springs. During the last two months the operations have been carried on with extreme difficulty. The discoveries are of more importance than was anticipated. The structure was destroyed in the Middle Ages, but not, as was supposed, in one of those fires which were common in Rome. The fragments of marble show that the demolition was by the hands of men, but under what circumstances has yet to be revealed. It is better to have fragments of ancient work than dust, for an attempt at reconstruction may be tried. The arrangements are not completely made out, but evidently there was a special door or opening with steps, through which the victims were led that were about to be offered up in sacrifice. In some respects the search may be considered as having a unique aim, and archæologists must hope that the form of so important a monument can be indicated.

STATUETTES in bronze were for many years favourite presents for distinguished visitors to Paris. The exhibition of works in ivory recently opened has revealed that gifts worthy of any king or prince are obtainable in that material. On the day of opening it was resolved by the representatives of the Municipal Council of Paris to purchase "La Danseuse au Cothurne" and "La Danseuse au Tambourin" by M. LÉONARD for the collection of the city. The visit of the King and Queen of ITALY has obtained for them another destination. Instead of appearing in the Petit Palais of the Champs-Élysées they will appear in the royal collection as representatives of the industrial art of Paris. Ivory statuettes are not unlikely to become the vogue. The Municipal Council will also present eighteen of the medals in silver which were prepared as memorials of events. By a curious irony several relate to new churches in Paris, viz. St. Joseph, St. Pierre de Montrouge, Trinity, St. Clotilde, St. Augustine; another shows the Hôtel de Ville, and one the Prison de Fresnes. They will be arranged in a cabinet on which the arms of Savoy will be emblazoned. Four of the splendid volumes, prepared at the instance of the Municipal Council upon the plans of Paris and its armorial bearings, will also be parts of the gift.

THE thirty-seventh annual convention of the American Institute of Architects was to be held in Cleveland, Ohio, on Thursday, Friday and Saturday of this week. Mr. CHARLES F. MCKIM was to preside. The following papers were to be read:—"The Necessity for Trained Men in Future Artistic Productions," by Mr. THEO. N. ELY; "The Advantages of the School of Rome for the Study of Mural Painting," by Mr. JOHN LA FARGE; "A Few Words on Academic Training in Sculpture," by Mr. AUGUSTUS ST. GAUDENS; "Rome as a Place of Schooling for a Decorative Painter," by Mr. E. H. BLASHFIELD; "The Significance of Rome to the American Architectural Student," by Mr. AUSTIN W. LORD. Reports were to be presented from the numerous committees of the Institute dealing with house and library, education and publication, foreign correspondence, contract and lien laws, applied arts and science, Government architecture, competitions, improvement of Washington, fine arts, municipal improvement, world's congress, metric system. With so much to be discussed three days are insufficient, and there is usually a large amount of business which has to be neglected or only partially dealt with at the conventions.

PUBLIC WORKS IN NEW SOUTH WALES.

A FEW years ago the colonies did not obtain much attention among ordinary Englishmen. They were supposed to be self-supporting. Grants were doled out to them with difficulty. Loans were not easily arranged. But now when they have assumed new, if rather indefinite, relations in respect to Great Britain, they must be considered under a different aspect. Claims are made and support is expected as if colonies ranked like English counties. One consequence is that the annual reports of expenditure are scrutinised instead of being passed over in a perfunctory way.

New South Wales is one of the colonies which to some extent was victimised. For years it was employed as a penal settlement, and on that account there was a prejudice against it as a home for honest emigrants. The stories about bushranging which prevailed a few years ago suggested that the criminal element was latent. Yet New South Wales can claim the distinction of being the first of all the colonies to raise a contingent for the purpose of aiding British troops, and the services rendered in the Soudan were creditable to the impromptu warriors.

As the colony rises the outlay must increase. The total expenditure in 1871 was 3,006,576*l.* For the year ending June 30, 1902, the expenditure on public works alone was 4,432,484*l.*, of which sum 3,262,537*l.* was provided from loan funds and 1,169,946*l.* from consolidated revenue. The costliest item was Darling Harbour. If the variety of undertakings be considered the sum must appear moderate. Besides establishment charges, works have to be carried out for railways, tramways, public buildings, roads and bridges, water conservation and public water-places, water supply of towns, sewerage, harbours and river improvements, dredging, wharves, telephone tunnels, pneumatic tubes, &c.

Whether economy is insured in the arrangements is likely to be doubted by some experts. In looking over the returns of work on railways, which amounted to 733,803*l.*, in nearly every case we find the stereotyped remark, "with the exception of station buildings all works on the line are being carried out by day labour." It is declared that, on the whole, the system has proved most successful. But, it is added, the result has only been obtained by increasing the duties and responsibility of the officers of the department. It is recorded also that works are completed within their estimated cost.

In the harbour works much circumspection has to be taken. The few Australian rivers are liable to send down a scanty supply of water in dry seasons, and then bars are likely to be increased and navigation impeded. Caution is therefore exercised to prevent expenditure which may not be efficacious. It is calculated that during the year 6,749,112 tons of mud, &c., were raised by the dredging plant at a cost of 4*l.* 11*s.* 4*d.* per ton. As much as possible of the stuff is used for reclamation, and in one place about 569 acres have been created, the land thus taking back the material which once formed part of it.

During the year 1,431 miles of roads have been constructed, bringing up the total in the State to 46,348. It is not to be supposed that the roads resemble those in England. Only about 16,000 miles, or a third of the length, are metalled, gravelled or formed. In this country havoc arises by the faulty construction of tyres, especially in the case of traction engines, and a wooden covering is sought by many surveyors. It has become customary with the officials in New South Wales to point out that the cost of maintenance is greatly increased by the common practice of using narrow tyres under heavy waggons, and relief can only be obtained by the passing of the Tyres Bill by Parliament. There is no hope that the wide tyre will be adopted except under compulsion, although all experiments tend to prove that its use is advantageous, and consequently the bulk of the traffic on the roads is impeded at present by the carelessness of the minority.

Credit is also claimed for constructing forty-six new bridges, the most important being the Pyrmont bridge across an arm of Sydney Harbour, which we have described and illustrated. It is a swing span 223 feet in length and 54 feet wide, weighing 800 tons, and is opened or closed in 44 seconds by two electric motors. Separate contracts

were let for abutments, side spans and swing spans, and the local contractors all carried out their work faithfully and satisfactorily in the opinion of the engineers. All operations connected with construction have to be analysed, and it is found that the cost of the preparation of plans, &c., for bridges has been 3.25 of the value of the work carried out. Water supply is of vital importance, and recourse is had to boring, which, however, is not always successful. It is estimated that the daily discharge of all the artesian wells in the State is 51,000,000 gallons per day, and the cost is put at 1*d.* per gallon.

The expenditure in the architect's department has been 280,786*l.* The amount is 92,736*l.* less than in the previous year, and no doubt the public in New South Wales will rejoice at the decrease. It is evident, however, that many public buildings are out of repair, and an increase in expenditure will hereafter be inevitable because of neglect of that proverbial stitch in time which saves nine or it may be ninety-nine stitches. In Great Britain and Ireland the expenditure on lunatic asylums is becoming alarming. But what is to be said when it is found that in New South Wales over six-tenths of the total outlay on the architectural department is required for the erection of a single building of that class? The outlay on the Kew Asylum has amounted to 171,012*l.* The decorations and illuminations for the Federal celebrations cost no less than 49,722*l.* 4*s.* 5*d.*, and those employed on the occasion of the Royal visit 14,109*l.* 15*s.* 4*d.* Mr. VERNON, Government architect, recognises that the day labour system is unavoidable, although no building contractor would adopt it. The defects are partly owing to the deprivation of power with those who are responsible for the works. Almost all the men are engaged through the State Labour Board, to which again a certain proportion is supplied through the Trades Hall agency. This leaves the officer in charge of the works, or his foreman, with no choice in choosing suitable men; and though no general conclusion can be made of the men engaged under the system as a whole, in many instances inability and want of application are not ascertained until after employment and consequent loss to the department. The regulation also prevents the employment of men well tried on one work from being engaged on a subsequent one is to an extent detrimental and adds considerably to the difficulties of the officer.

In New South Wales, as elsewhere, it is alleged that the buildings for public purposes are more expensive than in England. Mr. VERNON has prepared a calculation of the cost per head of population of court-houses. He has found that those erected prior to 1891 work out at 4*l.* 4*s.* 5*d.* per head, while those constructed since that date cost 2*l.* 15*s.* 11*d.* It is no doubt difficult to make exact comparisons in New South Wales, but a country which can spend 64,000*l.* on public illuminations is hardly wise in spending so much on public buildings to a brief excitement. The architect remarks:—"The repairs to the buildings remaining in the hands of the State are not progressing altogether satisfactorily; and I have to repeat, at the cost of a charge of tediousness, the urgent need of more liberal consideration for this necessary work."

The most important structure in a financial sense is the Central Railway station, of which the foundations were laid in April 1902. The cost of the work is estimated at 561,600*l.*, but owing to alterations it is estimated that the amount will be exceeded. The street in front of the station will be 165 feet wide, and other thoroughfares leading to it will be broadened to 80 feet. A car-house at Fort Macquarie has a castellated appearance in its construction. It is intended to accommodate seventy-two cars of the largest type. The reason for imparting an unusual character is that the residence of the Governor-General is close to the station.

At the present time there is in England agitation for the best system for administering roads. It may be interesting to explain the arrangements in New South Wales. The State is divided into sixty-four road districts, each presided over by a road superintendent, who in some of the more important districts is provided with an assistant clerk, and one or more foremen. Their duties embrace the construction and supervision of the roads, bridges, and works for the conservation or supply of water in their districts; they control all the labour employed

certificates for all payments, and report on all proposals for expenditure. The greatest length of scheduled road under direct supervision of any road superintendent is 1,402 miles, and the least 177 miles. Including unclassified subsidised roads, and roads under trustees, the actual mileage directly or indirectly under their control ranges from 1,402 miles to 239 miles. Road superintendents are responsible for the examination and proper maintenance of bridges and about 39,000 culverts, some of them of considerable size. They also control 134 ferries, and most of the tanks, dams, wells and artesian bores, together with the makers, ferrymen and others employed thereon.

In addition to the inspection of contracts and superintendence of roads, ferries, public watering-places, &c., the road superintendents have to devote a considerable amount of time to inquiring into and reporting upon applications for expenditure. Such applications usually come from individuals or small groups of residents more or less isolated from leading thoroughfares, and, with a limited sum available, great judgment and patient inquiry are necessary to determine the extent to which assistance can be given, and to separate genuine cases from bogus ones.

In the execution of their duties superintendents travelled 925 miles by road and 79,296 miles by rail last year, the assistants travelled 92,943 miles by road and 33,881 miles by rail, and foremen, overseers, &c., travelled 62,946 miles by road and 10,752 miles by rail. The total distance travelled by all district officers was thus 434,914 miles by road and 123,929 miles by rail, in all 558,843 miles. The average to the department was 2'42d. per mile. The greatest distance travelled in one district was 25,479 miles, and the average for all districts was 8,732 miles.

Judging from the report, the works would appear to be conducted in as economical a manner as is possible. Day labour is a costly system, but the overseers and other officers make the men understand that they are not privileged beings, but are expected to make a fair return for the money received. The State Labour Board is not a expensive establishment, and a large proportion of the money is devoted to provisions and clothing, seeds, tools, and blankets and other contingencies. The money is more wisely laid out than in English workhouses, and it saves men to tide over periods of stagnation. The engineer for water supply and sewerage says that on nearly every work a profit to the State has been secured by thus dealing with the contractor. The large claims for extra compensations which used to shadow nearly all contract work are now unknown, and it is also noteworthy that the number of accidents to workmen has diminished to a remarkable extent. In the comparatively small number of cases which have occurred the sufferers have been paid their wages until they resumed work.

There are many people in this country who consider New South Wales, in common with other parts of Australia, is too much disposed to pile up debts. That is a subject which admits of controversy. The public debt, which in 1880 was fifteen millions, in the course of twenty years increased to over sixty-five millions. But public works cannot be executed without loans, and it is quite certain that they are conducted on as economical conditions as can be devised.

ARCHITECTURE AND THE INFANT ACADEMY.

THE first exhibition of the Royal Academy was opened in the spring of 1769. In order that people might not be disappointed when they found a fee was charged for admission, the following note was prefixed to the catalogue:—"As the present exhibition is part of the institution of an Academy supported by royal munificence, the public may naturally expect the liberty of being admitted without fee. The Academicians therefore think it necessary to declare that this was very much their desire, but that they have not been able to suggest any other means than that of receiving money for admittance to prevent the Academy from being filled by improper persons, to the entire exclusion of those for whom the exhibition is apparently intended." The words reveal to us how slight was the

value which the public set upon a modern collection of pictures. JOHNSON a few years before, in referring to another exhibition of English work, said:—"Surely life, if it be not long, is tedious, since we are forced to call in the assistance of so many trifles to rid us of our time—of that time which can never return." There was, however, a change, and JOHNSON accepted the professorship of Ancient Literature in the new Academy.

As the pictures were brought together in a hurry the collection was more remarkable for its novelty than for its power. REYNOLDS sent a portrait of a "Lady and her Son in the character of DIANA disarming Love," and a portrait of a "Lady in the character of JUNO receiving the Cestus from VENUS," and other works. GAINSBOROUGH was represented by two portraits. WEST by his "Departure of REGULUS from Rome" and "VENUS lamenting the death of ADONIS." GEORGE BARRETT exhibited two Scottish scenes, one being "Part of Melrose Abbey on the river Tweed by Moonlight," which suggests that WALTER SCOTT was not the first to realise the beauty of the ruins on a fine night. We must not be detained, however, by the paintings, for the architectural views call for attention.

WILLIAM CHAMBERS, who was described as "Comptroller-General of the Works to the King, architect to the Queen and to Her Royal Highness the Princess Dowager of WALES, and treasurer of the Royal Academy," contributed the "Elevation and Plan of a Hunting Casino," belonging to the Right Honourable the Earl of CHARLEMONT, in Ireland; the "Ceiling of Her Grace the Duchess of BUCCLEUGH's Dressing room in Grosvenor Square;" the "Ceiling of the Right Honourable the Countess GOWER's Dressing-room at Whitehall," and the "Elevation of one of the Flanks of a Royal Palace." The casino was erected at Marino, Clontarf, in the suburbs of Dublin. It could hardly be called a hunting-lodge, and indeed its use has never been evident. Lord CHARLEMONT erected it in order to pass away the time in amateurish work, for, he declared, without some attractive employment he doubted whether he could have the resolution to stay in Ireland. Yet a few years afterwards he was taken to be the champion of Irish liberty. He had travelled in Italy, and could claim some share in the design. JOHN GWYNN was a friend of Dr. JOHNSON, who wrote a little essay for him on the difference between circular and elliptical arches when he was competing for Blackfriars Bridge, which he failed to carry off. He sent "An Architectonic Drawing, designed for the alteration of an old room in Shropshire."

CHAMBERS and GWYNN were the only professional architects who aided the earliest exhibition. THOMAS SANDEY, the first professor of architecture, held an official appointment as military draughtsman, and he was afterwards deputy ranger of Windsor Park. It is said, however, that the first Freemasons' Tavern was designed by him. He contributed two designs to the exhibition of 1769. There were other artists who selected architectural subjects. WILLIAM JAMES was a pupil or assistant of CANALETTI, and his three drawings bore the following lengthy description:—"The Remains of some Ancient Egyptian Temples, as they are now standing in and about Thebes in Upper Egypt, viz. A side View of the Great Temple of Osiris at Carnack, to which there were avenues of sphynxes half a mile in length, adorned with triumphal arches; on the right hand is a portico of a temple at Amara. The Temple of Osmanduas at Luxor. The Temple of Isis at the Isle Ell Hief, a little above the first cataract of the Nile; on the right hand is a small Temple of the Hawk, because Isis was there worshipped under that symbol." JAMES, no doubt, was indebted to some traveller for sketches, for he does not appear to have ever left England. ELIAS MARTIN, who, like CHAMBERS, by birth was a Swede, prepared a "View of Westminster Bridge with the King of Denmark's Procession by Water, taken from Mr. SEARL's Timber-yard." WILLIAM PARS is mainly known as a portrait painter, but in 1763 he was selected by the Dilettanti Society to accompany CHANDLER and REVETT as draughtsmen in their explorations in Greece. Afterwards he was maintained in Rome by the Society. He also went as artist with Lord PALMERSTON on the Grand Tour. His drawings in the first exhibition were:—"An

Arch at Mylassa in Asia Minor," "A Ruin at Troas in Asia Minor," "The Propylia; or, Entrance of the Acropolis at Athens," "The Castalian Spring at Delphi," "A Temple on the Island Ægina," "The Cave of Archidamus near Athens," "Miletus with the Ferry over the Meander." WILLIAM TOMPKINS, another draughtsman, had a view of a villa at Roehampton, which was designed and erected by CHAMBERS for the Earl of BESBOROUGH. It is now part of the college for Jesuit novices. He also showed views of residences of the Earl DE LA WARR and the Earl of FIFE.

The exhibition was held in two large auction-rooms opposite Market Lane, in Pall Mall. The offices were removed to the royal apartments at Old Somerset House in 1771, but the annual exhibitions continued in the rooms of Pall Mall. When the new buildings of Somerset House were sufficiently advanced, the Royal and Antiquarian Societies were united under one roof with the Royal Academy, and the first exhibition in the new premises took place in 1780.

In the second exhibition in 1770 we meet with the same exhibitors, with the addition of a few others. Under CHAMBERS'S name we find "Plan and Elevation of a Villa near London, for a Person of Distinction. A section of Earl GOWER'S Staircase at Whitehall. A ceiling at Woodburn Abbey. Various Vases, &c., to be executed in ormolu by Mr. BOLTON for their Majesties." By GWYNN were "A Plan, Elevation and Section of the Bridge to be built over the Severn at Worcester." WILLIAM JAMES continued his Egyptian series by "The Palace of Memnon at Medinet Habu, near Thebes, in the Upper Egypt. On the left hand is a Temple of Debonde, above the first cataract of the Nile; the Temple of Cous, where the ancient Egyptians kept and worshipped their sacred crocodiles. On the right hand is a small temple at Elephantine, where they worshipped a serpent called Knuphis." ELIAS MARTIN had "A Picture of the Royal Plaster Academy;" WILLIAM PARS "A View of the Great Temple of Minerva, built by PERICLES." THOMAS SANDBY was represented by "Elevation of a Country Seat for a Person of Distinction."

There were a few new-comers. JAMES WYATT, who was only twenty-two years old, had received a commission to alter the Panthéon in Oxford Street. He prepared three drawings for exhibition, viz. the front in the Oxford Road, a longitudinal section and a view of one of the angular piers. They must have made an impression on the Academicians, for WYATT was elected an Associate in 1770. In the preceding year there was a competition for the Royal Exchange in Dublin, which is now used as the city hall. THOMAS COOLEY was successful. One of the competitors was EDWARD STEVENS, a pupil of CHAMBERS. His drawings were exhibited, viz. "Plans of the Basement Storey and Principal Floor; Elevation of the Principal or North Front situated to form a termination to Parliament Street; West Front to face Castle Street." In addition were "Plan and Elevation for a Colonnade Bridge, in the manner of the Arcade Bridge on the River Nadir, in the Earl of PEMBROKE'S Gardens at Wilton," and "An Elevation for a Hunting Villa designed for a particular situation near the Forest of Needwood, in Staffordshire." STEVENS'S drawings were the earliest examples of competition work which appeared in the Academy. He also was elected an Associate in 1770, but as he died five years afterwards in Rome his name is almost forgotten. About GEORGE MULLINS little is known, except that in Ireland he painted trays and snuff-boxes. Besides three small heads, he was enabled to exhibit in 1770 a view of CHAMBERS'S Casino at Marino. Styles were not always discriminated with accuracy in those days, and the freely disposed Roman Doric structure was described as "The Gothic Temple in which is introduced the story of DIANA and ACTEON." From GEORGE DANCE, who designed the Mansion House, came "A Section and Plan of a Royal Gallery for Sculpture."

The year 1771 has an interest of another kind in the history of the Academy, for on St. George's Day the first of the annual banquets was held. GOLDSMITH, as professor of ancient history, was one of the guests. There was less formality than in subsequent years, for GOLDSMITH was able to relate the discovery of ancient poems at Bristol about which he was enthusiastic. JOHNSON laughed at him, and HORACE WALPOLE said he might have had the honour of

ushering the discovery into the learned world, as the wondrous boy THOMAS CHATTERTON had submitted to him. Then WALPOLE asked about CHATTERTON, and GOLDSMITH replied that he had committed suicide. In 1784 it is recorded that JOHNSON left his seat by the side of the Prince of WALES and went to the head of the table in order to have the honour of an introduction. In the third exhibition there were more representations of architecture than in those which preceded it. CHAMBERS described himself as "Knight of the Polar Star," showed signs for a chapel, a garden gate and a monument in a garden. GEORGE DANCE had the garden front of a house of a gentleman in the country. JOHN GWYNN contributed a design to make Whitehall a part of the British Museum, the addition of a Centrepiece opposite the Horse Guards, or in other words, to extend INIGO JONES'S fragment of a palace. RICHARD HOLLAND, who was a nephew of HENRY HOLLAND, the designer of the Pavilion, Brighton, the Albany, Piccadilly, and the portico and vestibule of Dover House, which is fortunately preserved in the transformation of the district, sent an elevation of a design for a villa. From THOMAS LEVERTON, the architect of Grocers' Hall and other works, came "A Design for Woodford Hall now building in Essex." THOMAS SANDBY sent a view from the arcade in Covent Garden. EDWARD STEVENS came "Elevation of the Principal Front of Doveridge Hall, the Seat of the Right Hon. Sir HENRY CAVENDISH, Bart., began anno 1769;" "A Casino and Shooting-box;" "Ground Plan of the (Roman) Villa of Laurentinum of PLINY, the Consul, as described in an Epistle to his Friend GALLUS;" "Elevation of the Principal or Front Entrance to ditto." JAMES WYATT sent several drawings, one a ceiling executed for Mr. ASHETON at Hagley in Staffordshire, the other the elevation of a house, intended for a nobleman, in Sussex. Nobleman those days were apparently the principal patrons of architecture. In 1771 JOHN YENN gained the gold medal of the Academy for his design for a nobleman's villa. He was first a pupil and then an assistant of CHAMBERS, showed in the exhibition a plan and elevation of a pavilion. There were several views of architectural subjects by painters, but it is not necessary to mention them.

We have some new names in the catalogue of the fourth exhibition. EDWARD BELK is credited with an elevation and plan of a temple in a garden. CLERISE, who was brought to England by ROBERT ADAM, and who was to be almost a centenarian, was represented by a design composed after the manner of the ancients; a sepulchral chamber, ditto; a view of the Forum of Nerva at Rome; a ruin of a triumphal arch (a composition)—subjects which suggest Italian studies. THOMAS HARDWICK, the father of PHILIP HARDWICK, and the grandfather of P. C. HARDWICK, made his début in the exhibition of 1772 with a design for the principal front of a casino, a subject that inspired many designs. He was a student of the schools and was then in his twentieth year. J. LEROUX was one of the transient contributors. His name was attached to "A Design for a Triumphal Arch, intended to have been erected where Ludgate Street was situated, to have honoured the King's entrance into the City of London;" and a design for a public chapel, the shops, forming a Forum intended to be built on the Peasants' Southampton. THOMAS SANDBY drew the garden front of the Royal Academy. EDWARD STEVENS supplied a design for a library, the decorations emblematical, according to heathen mythology, with plan and elevation of a design for the late Viscount HATTON, intended to be built in Northamptonshire. JAMES WYATT'S contribution was the south-east elevation of Heaton House in Lancashire, the seat of Sir THOMAS EGERTON, Bart., and an elevation of a garden pavilion designed for a nobleman of distinction in Derbyshire, with the plan and ceiling of same. JOHN YENN sent a plan and elevation of a gentleman's house and the principal front of a nobleman's villa. RICHARD HOLLAND also appears with the elevation and plan of a town house, with a design for a ceiling. The name of one noteworthy student appears for the first time. This was JOHN SOAN, who was afterwards known as Sir JOHN SOANE, and who was to hold high public offices of various kinds and to become pre-eminent in architecture. He worked his way up from an apprentice boy in DANCE'S office. He was employed by

D, and in 1772 he won the Academy's silver medal followed four years afterwards by the gold medal travelling studentship. SOANE in 1772 exhibited the front of a nobleman's town house. In the next year he was able to show "The Front next the Thames" at the Royal Academy, from actual measurements in 1770," which may be assumed to have been the first example of its kind that was required in the school.

The foregoing records are sufficient to suggest the efforts to assert the claim of architecture to have a share in the attention of the public visiting the Academy exhibitions. If they appear few in number, it must be remembered that the collection itself rarely contained 400 works. At the earliest exhibition there were only 136 items, and the second 245. The character of the works corresponded with what we yearly see in Burlington House, or many of the drawings were only projects which never appear to have been realised in brick and stone. There was one class of work which then was neglected, churches, but they could not be erected without the sanction of Parliament.

MANCHESTER SOCIETY OF ARCHITECTS.

At the 8th inst. Mr. J. W. Beaumont, president of the Society, gave his opening address at a special meeting in the board-room of the Chamber of Commerce, Manchester. He looked forward, he said, to the day when architectural societies may become so important that they may be consulted by the public in cases of proposed improvements or new streets to be laid out in those towns. It will never, he admitted, be a public body to say that the buildings in an immediate street shall all be carved out of a certain design, nor can an architect be appointed to carry out all the designs for such a street, nor would this be desirable. Variety in architecture was, to his mind, much better than uniformity. Generally each building had its own use, and should be designed to express the purpose for which it was erected. It was absurd to confine the elevation of a street to one architectural design, where one building may be used as shop, another as a set of offices or chambers, and another as a house. But it would be held that some control should be exercised to see that proper and suitable heights are maintained, and that materials are used in the various buildings to harmonise with neighbouring buildings. One thing that impressed on his hearers was that more control should be exercised by public bodies in seeing that all new streets erected in such a manner as to minimise the risk

of subjects of great importance had received a large amount of attention during the last twelve months, and that these were the question of the statutory registration of architects. The time is at hand, Mr. Beaumont said, when architects must make up their minds on this question. In order to ascertain the general feeling on the subject he had invited the opinion of various societies in different parts of the country, and out of twelve from which he received replies, six were in favour of registration, one was divided in opinion, and three had not discussed the question. The Manchester Society had already decided in favour of registration. Of course, as was the case with other professions, no form of registration would suffice to "quack," but it would enable the public to distinguish between qualified and unqualified architects. It would be an advantage to a man to employ an architect legally qualified, and against whom he would have no redress in case of neglect or incompetence.

In conclusion, Mr. Beaumont said it was important that all students should pass all the examinations of the Institute of British Architects, and not simply the first year. In this connection he referred to the establishment of a school of architecture in Manchester. He was glad to hear that a school had been established. The time of apprenticeship, perhaps, be shortened for those who had passed the school, but nothing in the shape of theoretical or practical training would enable a student to dispense with the training of an architect's office. He believed that the Manchester School of Architecture will become, under the leadership of Mr. S. H. Capper, one of the foremost centres in the country for the instruction of architectural students. Turning to the question of competitions, Mr. Beaumont suggested that there had been overdone. He recognised the value and importance of competitions in the case of public buildings, but in all cases should be conducted on an equitable basis. He suggested certain ways in which a useful reform in regard to competitions might be brought about.

Mr. Alfred Darbyshire (who has filled the office of president for the past two years) moved a vote of thanks to the President for his address, and that it be printed and circulated forthwith.

Mr. Capper, of the School of Architecture, in seconding the motion, gave the result of his experience of the working of a registration law in the province of Quebec. Whilst he was at the head of the School of Architecture in that province architecture was made a close profession in the same sense as the bar and medicine are close professions. Some of the results were not exactly what one would wish. One of the immediate results was to flood the profession with unqualified men, because every person who had had a sign-plate with the word "architect" upon it had to be admitted as a qualified architect. Of course time would cure such an evil. With regard to the School of Architecture here in Manchester, he fully appreciated the necessity of practical training. He suggested, however, that arrangements might be made whereby students, in some cases, might carry on their collegiate training side by side with their practical work.

STRANGERS' HALL, NORWICH.

IT is to be regretted, says a correspondent of the *Times*, that more has not been done in the past to preserve characteristic examples of our Mediaeval domestic buildings. The life and surroundings of the English nobility and landed gentry of the Middle Ages can be traced in many a fine old mansion which stands to-day, but illustrations of the home life of the wealthy merchants of those days are far to seek.
